Water Supply , by Rolf Eliassen	738

Peace is the leading item on the agenda of mankind, and every effort should be made to lead us toward that goal.

—Lyndon B. Johnson

PREFACE

MOMENT OF PEACE IN VIETNAM
permits two men to fish outside barbed wire protecting U.S. base at Danang.

The year 1965 may well be remembered for the tentative but no less real steps that were taken to achieve man's age-old dream of a lasting peace. Although the most publicized events of the year concerned the progress of war—in Vietnam, the Dominican Republic, and Kashmir—the principal preoccupation of peoples and their statesmen was the pursuit of peace. Thus, the United Nations succeeded in establishing a cease-fire in the conflict between India and Pakistan over Kashmir, and the Organization of American States created a special force to restore peace to the Dominican Republic following a Communist-infiltrated civil war. Pope Paul VI, who seemed to embody the hopes and aspirations for peace held by men everywhere, made a special peace mission to the United Nations. And at the end of this war-afflicted year, President Johnson launched a massive peace offensive intended to lead to negotiations for the peaceful solution of the year's worst dilemma—the war in Vietnam.

Despite the pressing issue of war or peace, in 1965 the peoples of all countries went about their daily tasks, contributing to the improvement of their own societies. In the United States, a sustained effort was made to achieve what President Johnson has called the Great Society by initiating such legislative milestones as Medicare, the Voting Rights Act, and federal aid to education laws. Notable scientific advances of the year included the first "walk" in space by Soviet and American astronauts, the initial rendezvous of two manned spacecraft (Gemini 6 and 7), and the close-up photographing of the moon and the planet Mars. During the year the world was saddened by the deaths of three great humanitarians—Sir Winston Churchill, Adlai Stevenson, and Dr. Albert Schweitzer.

The great and lesser events of 1965 are recorded in this 44th edition of the *ENCYCLOPEDIA AMERICANA's* yearbook of current events, which reviews in detail the year's political, economic, scientific, and cultural developments. In nearly 500 articles, leading authorities offer a comprehensive review of current trends and developments, designed to keep readers abreast of the great explosion of knowledge now taking place. To help explain some of the more crucial issues of our time, *THE AMERICANA ANNUAL* presents a number of special features on such topics as the Anti-Poverty Program, Civil Rights, Food Supply, International Finance, Medicare, Pollution, and Water Supply.

Extensive graphic coverage is provided by the hundreds of photographs, maps, captions, charts, and diagrams which supplement the text by showing in meaningful detail the import of historical events, scientific discoveries, economic trends, and other developments. A profuse selection of the year's best news photographs help to recreate the dramatic events described in the articles.

To the thousands of persons who contributed to the writing and printing of this volume, the editors wish to express their sincere gratitude.

PART 1 • OUTSTANDING DATES OF 1965

PART 2 • TOPICAL SURVEY OF THE YEAR

UPI

THE AMERICANA ANNUAL

CHRONOLOGY • 1965

OUTSTANDING DATES OF 1965

JANUARY

- 4—New 89th Congress convenes with 295 Democrats and 140 Republicans in House of Representatives, 68 Democrats and 32 Republicans in Senate. President Johnson, in his second State of the Union message, pledges support for South Vietnam and calls for building of Great Society.
- 20—Lyndon B. Johnson takes oath of office for first full term as president.
- 21—Indonesia formally withdraws from United Nations.
- 24—Sir Winston Churchill dies in London at the age of 90.
- 28—President Johnson names Nicholas deB. Katzenbach as U.S. attorney general, to succeed Robert F. Kennedy.

FEBRUARY

- 4—French President de Gaulle calls for reorganization of United Nations and return to international gold standard.
- 7—War in Vietnam is expanded as U.S. begins air attacks on North Vietnam.
- 18—UN General Assembly adjourns 19th session after U.S. and USSR join to defeat Albania's attempt to force showdown on question of unpaid assessments.
- 18—Gambia, Britain's last dependency in western Africa, becomes independent nation.
- 20—U.S. Ranger 8 spacecraft hits the moon after transmitting 7,137 pictures of lunar surface.
- 21—South Vietnamese Armed Forces Council removes Lt. Gen. Nguyen Khanh as council chairman and commander of the armed forces, thus ending his 13-month rule.

MARCH

- 9—President Johnson signs into law \$1.4 billion federal-state program of economic aid for Appalachia.
- 14—Argentine congressional elections increase Peronist strength in 192-member Chamber of Deputies.
- 18-19—Soviet Voskhod 2 spacecraft makes 17-orbit flight with astronauts Pavel I. Belyayev and Aleksei A. Leonov aboard; Leonov becomes first man to float in space as he leaves craft for 10 minutes while tied to lifeline.
- 19—Henry H. Fowler is appointed U.S. secretary of the treasury, succeeding C. Douglas Dillon.
- 21-25—About 3,200 Negroes and whites make 54-mile "freedom march" from Selma to Montgomery, Ala., protected by troops. Mrs. Viola Liuzzo, civil rights worker from Detroit, is murdered.
- 23—U.S. orbits its first two-man spacecraft, Gemini 3, carrying Virgil I. Grissom and John W. Young.
- 24—U.S. Ranger 9 spacecraft hits moon after sending back 5,814 pictures.
- 25—Dudley Senanayake takes office as prime minister of Ceylon, heralding reversal of trend toward leftist policies.
- 30—Terrorist bomb wrecks U.S. embassy in Saigon, killing 17 persons, including 2 Americans.

APRIL

- 7—President Johnson, in speech at Johns Hopkins University, offers to begin unconditional peace negotiations on Vietnam; proposes \$1 billion in U.S. aid for economic development of Southeast Asia, including North Vietnam.
- 10—Fighting breaks out between Indian and Pakistani troops along disputed border in Rann of Kutch.
- 11—President Johnson signs into law \$1.3 billion federal aid-to-education bill. Tornadoes sweep six Midwestern states, killing 242 persons.
- 14—West German President Lübke signs act extending statute of limitations on World War II crimes to Dec. 31, 1969.
- 21—President Bourguiba of Tunisia proposes settlement of Arab-Israeli dispute on basis of 1948 UN plan; is denounced as "traitor" by other Arab leaders.
- 24-25—Supporters of ex-president Juan Bosch overthrow ruling civilian junta of Donald Reid Cabral in Dominican Republic; civil war begins as anti-Bosch forces capture part of the capital, Santo Domingo.
- 28—President Johnson sends U.S. troops to Santo Domingo to prevent Communist takeover of Dominican Republic.

MAY

- 14—Communist China explodes second nuclear device.
- 15—In United States, national "teach-in" debate on Vietnam is heard by more than 100,000 persons on 100 college campuses by means of special radio hook-ups.
- 18—U.S. resumes air attacks on North Vietnam after six-day suspension of bombings produce no peace overtures.
- 23—Inter-American Peace Force organized by OAS begins peacekeeping mission in Santo Domingo.

JUNE

- 1-2—Cyclone in East Pakistan takes 30,000 lives, following similar disaster May 11-12, when 15,000 died.
- 4-7—U.S. Gemini 4 spacecraft, manned by James A. McDivitt and Edward H. White, makes 62-orbit flight; White takes record 20-minute "walk" in space.
- 7—U.S. Supreme Court strikes down Connecticut birth-control law, establishing "right of privacy."
- 9—Air Vice Marshal Nguyen Cao Ky is made premier of South Vietnam by National Leadership Committee.
- 19—Col. Houari Boumedienne takes power in Algeria after leading military coup that ousts President Ben Bella.
- 20—Bernard M. Baruch dies in New York at the age of 84.
- 21—President Johnson signs bill providing for \$4.6 billion cut in federal excise taxes.
- 22—Japan and South Korea sign treaty restoring diplomatic relations after 55-year lapse.

JULY

- 1—Cease-fire ends fighting between India and Pakistan in Rann of Kutch.
- 6—France withdraws permanent representative from European Economic Community, thus blocking further development of Common Market.
- 14-15—U.S. Mariner 4 spacecraft flies past Mars; measures atmosphere and magnetic field and takes 21 pictures of planet's surface from distances of 10,500 to 6,118 miles.
- 15—Adlai E. Stevenson dies in London at the age of 65.
- 20—Supreme Court Justice Arthur J. Goldberg is named to succeed Adlai E. Stevenson as U.S. ambassador to UN.
- 26—Maldives Islands gain independence from Britain.
- 27—John W. Gardner is named secretary of health, education, and welfare, succeeding Anthony J. Celebrezze.
- 28—President Johnson names Washington lawyer Abe Fortas to replace Arthur J. Goldberg on Supreme Court.
- 30—President Johnson signs Medicare bill, providing medical care for the aged under the Social Security System.

AUGUST

- 5—Fighting erupts between India and Pakistan in Kashmir.
- 6—President Johnson signs Voting Rights Act of 1965.
- 9—Singapore becomes independent after withdrawing from Malaysia federation.
- 10—President Johnson signs \$7.5 billion Housing Act.
- 11-16—Negroes riot in Watts district of Los Angeles; 34 die, and property damage is put at \$40 million.
- 16—U.S. drops demand that UN members more than two years behind in paying assessments be deprived of vote in General Assembly, as specified in UN charter.
- 24—United Arab Republic and Saudi Arabia sign new non-intervention pact and peace plan for Yemen.
- 25—Lawrence F. O'Brien is named U.S. postmaster general, to succeed John A. Gronouski.

SEPTEMBER

- 2—Communist Chinese Defense Minister Lin Piao calls for revolutionary wars in developing nations.
- 3—Héctor García-Godoy takes office as provisional president of Dominican Republic after both factions in civil war have accepted (Aug. 31) OAS peace plan.
- 4—Dr. Albert Schweitzer (90) dies at Lambaréné, Gabon.
- 6—India extends Kashmir war by invading West Pakistan.
- 9—French President de Gaulle insists that joint command of NATO end in 1969; says that France will no longer accept integrated defense system for western Europe. Hurricane Betsy devastates Louisiana, killing 81. President Johnson signs bill creating new cabinet-level Department of Housing and Urban Development.
- 16—Communist China demands that India dismantle military installations on Sikkim-Tibet border within three days.
- 19—West German Chancellor Erhard's coalition retains control of government as result of elections to Bundestag.
- 23—Truce signed by India and Pakistan (Sept. 22) at insistence of UN Security Council goes into effect.
- 24—U.S. and Panama agree in principle on new Panama Canal Treaty that will give Panama sovereignty over Canal Zone.
- 25—Stephanos Christos Stephanopoulos forms coalition government in Greece, ending governmental crisis.

OCTOBER

- 1—Indonesian army crushes Communist-backed coup (Sept. 30) and begins campaign to eradicate Communist party.
- 3—President Johnson signs bill liberalizing U.S. immigration policies.
- 4—Pope Paul VI makes peace mission to the United Nations; addresses General Assembly in New York and confers with President Johnson.
- 17—New York World's Fair closes after drawing attendance of 51,607,037 in two-year run.
- 27—Brazilian President Castelo Branco invokes revolutionary executive powers and dissolves all of the country's political parties.

NOVEMBER

- 8—President Johnson signs \$2.3 billion Higher Education Act of 1965, providing first federal scholarships.
- 8—Liberals win 131 seats in election for Canadian House of Commons; Lester Pearson remains prime minister.
- 9-10—Power failure blacks out parts of northeastern U.S. and Canada.
- 11—Rhodesia declares its independence from Britain; British Prime Minister Wilson imposes economic sanctions.
- 15—U.S. Supreme Court rules that individuals may refuse to register as members of Communist party.
- 18—Henry A. Wallace dies at Danbury, Conn., at age of 77.
- 26—France becomes third nation to launch its own satellite.

DECEMBER

- 1—First plane-load of Cuban refugees arrives in U.S. under airlift agreement of Nov. 6.
- 8—Pope Paul VI closes Ecumenical Council Vatican II in Rome.
- 15—Astronauts Walter M. Schirra, Jr., and Thomas P. Stafford maneuver Gemini 6 spacecraft to rendezvous with Gemini 7, launched on Dec. 4.
- 18—Gemini 7 astronauts Frank Borman and James A. Lovell, Jr., complete record 14-day, 206-orbit flight.
- 19—President de Gaulle wins runoff election by 55.2% majority for French presidency after failing to win a majority of votes in Dec. 5 election.
- 24—U.S. suspends air attacks on North Vietnam and begins major diplomatic peace offensive.

TOPICAL SURVEY OF THE YEAR

This survey presents a selected list of the year's most important events with the intention of helping the reader find the dates on which the most significant events of 1965 took place. It also serves as a guide to the most important developments in any subject, particularly political developments in the major countries. Articles on most of the countries, persons, organizations, and general subjects listed may be found in the main text of this volume. This Topical Survey lists main subject headings in alphabetical order, with specific events under the subject headings listed in order of their occurrence. The cross references used herein refer only to headings within this survey, not to articles in the main text.

ACCIDENTS AND DISASTERS—See CHILE; EL SALVADOR; MISSILES; PAKISTAN; UNITED STATES

AFGHANISTAN

Women vote in parliamentary elections for first time; four are elected to the lower house, **Aug. 26-Sept. 3**
 Mohammed Hashim Maiwandwal, former ambassador to the U.S., is appointed premier following resignation of Mohammed Yusuf, **Oct. 29**

AFRICA

Heads of state of 13 French-speaking African nations, meeting in Nouakchott, Mauritania, form the *Organisation Commune Africaine et Malgache*, **Feb. 10-12**

UPI

THE AMERICANA ANNUAL

UPI

REVIEW OF THE YEAR

PIX

ACCIDENTS

More Americans were killed in accidents during 1964 than in all battles of the Korean War, World War I, the Spanish American War, the Mexican War, the War of 1812, and the Revolutionary War. Accidents remained the fourth leading cause of death in the nation, exceeded only by heart disease, cancer, and vascular lesions. For the population group between the ages of 1 and 37, accidents were the greatest cause of death.

Accidents in the United States. Accidental deaths in the United States during the first 10 months of 1965 totaled about 87,400, 1% more than in the same period of 1964. Motor vehicle accidents were up 2%, and public nonmotor vehicle accidents were up 4%. Work accidents were down 1%, and accidental deaths in the home decreased less than 1%.

A record 49,000 deaths from vehicle accidents may be reached in 1965, on the basis of rates established during the first 10 months of the year. The previous high, in 1964, was 47,700.

In 1964, accidents of all kinds took 105,000 lives in the United States—an increase of 4% over 1963. Accidents killed nearly 55 persons per 100,000 population—a slight increase over the 1963 rate of 53.4. In addition to fatal accidents, 10,200,000 persons were injured by accidental causes in 1964.

ACCIDENTAL DEATHS IN THE U.S., 1962-65

Year	Total ¹	Motor vehicle	Public nonmotor vehicle	Home	Work
1962.....	97,139	40,804	17,000	28,500	13,700
1963.....	100,669	43,564	17,000	29,000	14,200
1964.....	105,000	47,700	18,000	28,500	14,200
1964 (Jan.-Oct.)..	86,300	39,050	15,400	22,900	11,800
1965 (Jan.-Oct.)..	87,400	39,760	16,000	22,800	11,700

¹ Duplications between motor vehicle, work, and home accidents are eliminated in total. Deaths of military personnel are assigned to motor vehicle, public nonmotor vehicle, and home accidents, according to the type of accident. (Sources: National Vital Statistics Division and National Safety Council.)

During 1964, accidental deaths occurring in the home, at work, and in public places (excluding motor vehicle accidents) were attributed primarily to the following causes: falls (19,100); fires and burns (7,700); drownings (6,700); poisoning (3,600); railroad accidents (2,600); and accidents involving firearms (2,400).

Costs. Accidental death and injury cost the United States an estimated \$16.7 billion in 1964. These costs included wage losses, medical fees, hospital expenses, insurance overhead costs, damaged or destroyed property, and lost production. It was estimated that since 1913, when the National Safety Council was founded, organized safety efforts in the United States have saved more than 1.1 million American lives.

Canada. Canada reported 10,255 accidental deaths in 1963 (the latest year for which complete figures were available). The death rate per 100,000 population was 54.3—the same as the 1962 rate. Motor vehicle accidents claimed 4,451 lives in Canada in 1963—more than any other accidental cause of death—followed by falls (1,564), drownings (1,130), burns (584), railroad accidents (249), and poisoning by gas (147).

HOWARD PYLE
President, National Safety Council

ADVERTISING

Advertising again expanded with the economy in 1965. Expenditures by advertisers in all kinds of media in the United States increased 5.5%, to reach a record total of \$14.94 billion. National advertisers spent \$9.22 billion, or 6% more than in 1964. Local advertisers spent \$5.72 billion—an increase of 5% over 1964.

Expenditures and Revenues. According to data compiled by McCann-Erickson, Inc., for the magazine *Printers' Ink*, all media except newspapers chalked up an increase in advertising volume. Expenditures by national advertisers in newspapers totaled \$850 million, just matching the figure for 1964.

The greatest gain—9%—was shown by magazines, which received \$1.2 billion in advertising revenue in 1965. This was the first year since television became a major medium that another medium registered a larger gain. National and spot television, however, did show the second-largest increase—7.5%—to reach a total of \$2.05 billion. Other media recorded the following expenditures by national advertisers: network and spot radio, \$305 million (up 1%), business papers, \$675 million (up 8%), and billboards, \$120 million (up 3%).

Advertising Agencies. Advertising is not only entrenched as a function of business, but is also a big business itself. The owners of the Grey Advertising Agency sold 23.6% of the agency's stock to the public for \$5,655,000. Each of four principal sellers received more than \$700,000 for the shares he sold. The three other major agencies that have issued stock to the public had financially successful years. As a result of these developments, agency stock is attractive to the public, and the sale of agency stock has become an interesting possibility for the owners.

The merger trend among agencies continued. The biggest merger of the year combined Batten, Barton, Durstine & Osborn with Clyne Maxon.

In the past, agencies have been paid a 15% commission by the media on the cost of the advertising space or air time they buy. In recent years, however, increasing numbers of clients have asked for rebates on their commissions and have paid their agencies on a fee basis for work performed. The American Tobacco Co., which switched to the fee system in 1965, disclosed at year's end that it had saved \$1,400,000.

Government Regulation. Congress passed a law requiring a health warning on cigarette packages beginning in 1966. In an effort to ward off a requirement for similar warnings in cigarette advertising, the tobacco industry adopted self-regulatory policies banning advertisements that might encourage young people to smoke. Congress also passed an anti-billboard measure granting a bonus in federal funds to states that prohibit billboards along federal-aid highways. Also, the Federal Communications Commission warned broadcasters to reduce the volume of sound of television and radio commercials.

Fraud. Blatantly deceptive advertising was rarer in 1965 than in the past, but a landmark case was concluded when the Kastor, Hilton, Chesley, Clifford & Atherton agency was fined \$50,000 for its role in the allegedly deceptive advertising during 1956-63 for Regimen "reducing" tablets. In the past, courts have tended to act only against advertisers and to ignore the agency's role.

WALTER JOYCE
Editor, "Printers' Ink."

LOCKHEED'S C-5A, a troop carrier shown in the wooden mockup stage, will be the world's biggest plane.

AERONAUTICS

Aeronautics was highlighted in 1965 by a heavy reliance on airpower in the war in Vietnam; by the decision of the United States to build the world's largest aircraft, the C-5A troop carrier; and by substantial increases in commercial airline mileage and revenue in the United States.

MILITARY AVIATION

The United States developed and successfully used unusual techniques in air warfare to meet the special demands of the struggle in Vietnam. The U.S. arsenal of airborne equipment ranged from armed helicopters to giant B-52 bombers. The latter were designed to carry nuclear weapons to distant targets, but in Vietnam they were deployed for lesser tasks in a limited war. During the year the use of

American air power grew in scope in Vietnam as the United States accelerated its war effort.

Air Power in Vietnam. More armed helicopters were used in Vietnam than in any previous conflict, and the number increased substantially when the 1st Cavalry Division (Airmobile) arrived in the combat zone in the late summer of 1965. New procedures were developed by which helicopters can transport troops to fight small bands of Communist guerrillas and carry out rescue and evacuation operations from battle scenes.

The B-52's, based in Guam, were called on to drop conventional bombs on tactical targets in Vietnam, 2,800 miles away. Able to fly in bad weather and perform with great accuracy, the long-range B-52's were used advantageously in jungle warfare by quickly saturating targets with great numbers of small bombs.

23

SOVIET UNION'S AN-22, turboprop here displayed at an air show in Paris, can carry 700 passengers.

COPYRIGHT AVIATION WEEK AND SPACE TECHNOLOGY

(TOP) BRITISH AIRCRAFT CORPORATION; (BOTTOM) BOEING

SUPERSONIC TRANSPORTS, scheduled to fly in the early 1970's, reached the mockup stage in 1965. Anglo-French designers built a Concorde fuselage (upper photo) in wood. A cockpit mockup of the Boeing SST (lower photo) permitted better runway visibility than in present subsonic jetliners.

The term "strategic persuasion" was introduced to denote the bombing by U.S. planes of military installations in North Vietnam. These bombings were carried out to try to induce the enemy to accept offers of peace negotiations. In line with this policy, the United States applied what its Air Force chief of staff called "a measured amount of strategic airpower."

In another tactical air maneuver developed in Vietnam, U.S. aircraft sprayed chemicals to defoliate forests, thus denying cover to the enemy. Conventional air strength was employed to cut guerrilla supply lines, spot enemy movements, observe artillery fire, and deliver firepower in direct support of troops.

C-5A. The Department of Defense awarded Lockheed Aircraft Corporation a \$2 billion contract to build 58 C-5A troop carriers. This jet transport will carry any of three loads: 600 fully armed troops, 700 nonmilitary passengers, or 50 tons of

cargo. The cavernous interior of the C-5A has enough room for six civilian-type buses or 16 $\frac{3}{4}$ -ton trucks. Ten planes this size can carry loads equal to the total capacity of all the planes engaged in the famous Berlin airlift of 1948. The C-5A is an outgrowth of earlier concepts, and its development was hastened by world events that showed the necessity for having an immense airlift capacity.

General Electric will make the C-5A's four jet engines, each of which will generate 40,000 pounds of thrust. The gross weight of the plane will be about 700,000 pounds, and the top speed will be about 550 mph. With a length of 230 feet and a wing span of 220 feet, the C-5A will be more than twice as large as any current U.S. military transport, and larger than the USSR's new AN-22 transport. The Department of Defense placed the C-5A order in September, and expects deliveries to begin in 1969.

C-141. The Lockheed C-141 Starlifter, capable of carrying one third the cargo of the C-5A, was placed in service in 1965. The C-141 represented major advances over existing aircraft. The Pentagon reduced its C-141 order when it announced the C-5A award but later restored the full order.

Manned Bomber. Development of a completely new manned bomber was discussed but appeared remote after Secretary of Defense Robert S. McNamara announced in December 1965 that the Air Force would use a bomber version of the F-111 tri-service fighter (originally the TFX). The government planned to order 210 of the aircraft at a cost of \$1.7 billion. The bomber, designated the FB-111, will be able to fly from 5,000 to 6,000 miles at speeds near 1,300 mph. Deliveries will start in 1968 and continue through 1971.

Meanwhile, the Department of Defense acted to modify its present global manned bomber, the B-52, to extend its lifetime. Research and development was pushed in 1965 on new avionics (aviation electronic) components for the B-52, and bids were invited for a two-year contract to develop a new propulsion system.

The Pentagon announced that it would eliminate all B-58's from the manned bomber force and cut back its B-52's by 1971, when the new FB-111's would be in operation.

F-111. The F-111A, the Air Force's version of the tri-service fighter, was being tested, and it was forecast that the first F-111A's would go into service near the end of fiscal year 1967. The Air Force will spend about \$7.6 billion for 1,500 of these jets. The F-111A, built by General Dynamics, is designed to reach speeds of up to 1,685 mph. It has variable sweep wings that extend almost straight out from the fuselage at low speeds, but sweep back sharply at higher speeds for faster, more efficient flight. In May 1965 the Navy rolled out its version of the tri-service fighter, the F-111B.

YF-12A and SR-71. The YF-12A, an interceptor, and the SR-71, a strategic reconnaissance plane, were tested in 1965. Both are mach 3 (three times the speed of sound) aircraft, derived from the A-11, which can sustain speeds of more than 2,000 mph and fly at altitudes of more than 70,000 feet.

No decision was reached to adopt the YF-12A, and indications were that it would not be developed after the Department of Defense elected to adapt the F-111 to a reconnaissance version, the RF-111. The SR-71 carries a crew of two and flies to 80,000 feet. Built by Lockheed, the SR-71 apparently outperforms Lockheed's U-2, the famed spy plane.

COIN. Spurred on by combat experience in Vietnam, the services searched for a mosquito-like counterinsurgency (COIN) aircraft. Toward this end, the Navy ordered the North American OV-10A, which in 1964 had won the Marines' light armed reconnaissance aircraft competition. The services also studied General Dynamics' Model 48 Charger and other COIN craft. According to service specifications, COIN craft should be twin-engine light planes that can provide air support in primitive areas. They must be capable of short takeoffs and landings, and should be readily adaptable to reconnaissance and transport purposes.

V/STOL. Intense research and development continued on vertical and short takeoff and landing (V/STOL) aircraft. The magnitude of the effort made it apparent that the services intend to adapt these planes to active military systems. V/STOL craft hold great promise because of their ability to hover at slow speed and then scoot away swiftly.

The largest of the vertical takeoff and landing (VTOL) craft, the Ling-Temco-Vought X-142A tilt-wing plane, made the full transition from hovering to conventional flight early in 1965, and by mid-year the Air Force had started a 15-month test program. Tests also continued on the Ryan Aeronautical XV-5A lift fan, the Lockheed XV-4A Hummingbird, and the Hawker Siddeley XV-6A. The XV-6A was being developed jointly by the United States, Britain, and West Germany. Also undergoing tests were the X-19A, which has a twin turbine and four tandem tilted propellers, and the tilting-duct X-22.

The Air Force proposed a V/STOL assault transport, the CX-6, to be developed by the mid-1970's, that would use lift-fan engines to carry a 10-ton payload. Also in the Air Force plans was an advanced V/STOL strike support fighter that can attain a mach 2.2 speed at an altitude of 50,000 feet.

Helicopters. Helicopter development was spurred by the war requirements in Vietnam. The Army outlined plans for an Advanced Aerial Fire Support System, comprising armed escort craft that would carry much greater firepower than any previous helicopters. It will be built by Lockheed Aircraft. During 1965 the Bell Helicopter Company, the Boeing Company's Vertol Division, and Sikorsky Aircraft announced faster and more heavily armored versions of existing models.

Other Planes. The experimental triangle-tailed XB-70 was being used by the Air Force to test cer-

LOCKHEED

THE YF-12A, a 2,000-mph interceptor that can operate at 70,000-foot altitudes, was tested extensively in 1965.

tain advanced concepts, and by the National Aeronautics and Space Administration to carry out supersonic transport studies. Other advanced concepts, including ramjet flight, were being tested on the X-15, which has recorded a height of 67 miles and a speed of 4,104 mph. The Northrop F-5 Freedom Fighter, a supersonic bomber ordered for allies of the United States under its military assistance programs, was sent to Vietnam for combat operations to determine whether the United States should buy 200.

Air Force Programs. The Air Force sought funds for 517 aircraft during the 1966 fiscal year. The Air Force's active aircraft decreased from 15,380 on June 30, 1964, to 14,411 on June 30, 1965, and it was forecast that the Air Force would have 13,706 active aircraft on June 30, 1966. However, the escalation of the war in Vietnam assured an increase in the 1966 figure. The Air Force retained some F-100's, F-102's, and B-57's that it had planned to

THE XB-70A, built by North American for research, lands after a flight in which it topped 2,000 mph.

UPI

NAVY VERSION of the General Dynamics F-111B undergoes a flight test by Grumman, builder of the B model.

phase out of active duty. During 1965 the Air Force also acquired the RF-4C reconnaissance aircraft, the HC-130H helicopter, and the C-141 jet transport, and accumulated funds to buy the F-111, SR-71, Northrop T-38, and an advanced development and engineering version of the F-4. It slowed its purchases of the present F-4, however. To improve close-support operations, the Air Force evaluated the A-4, A-6, A-7A, and F-5. It also studied the concept of a close-support fighter to bridge the gap between the old propeller-driven planes and supersonic jets, and looked into such advanced concepts as the Scramjet (a supersonic combustion ramjet) and hypersonic propulsion for speeds over mach 3.

Army Programs. The Army had 6,338 aircraft on June 30, 1965, and its initial request for funds during fiscal year 1966 called for 1,018 more. However, as a result of the Vietnam warfare, supplemental appropriations were granted, adding greatly to the number of Army aircraft, especially helicopters, planned for 1966.

Meanwhile, the Army worked on outlining the major airborne and airmobile units to be included in its long-range aeronautics program. The general

direction of this program was indicated when an experimental air assault division, using helicopters to support field troops, was formed into the 1st Cavalry Division (Airmobile) and assigned to Vietnam. The division goes into battle with 434 aircraft, almost all helicopters, compared with 101 aircraft in the standard Army division. The 1st Cavalry operated with UH-1B armed helicopters, UH-1D transport helicopters, CH-47A medium helicopters, and smaller observation helicopters—OH-13's, OH-23's, U-6's, and fixed-wing OV-1 Mohawks. The creation of additional airmobile divisions was announced later in 1965.

During fiscal year 1966 the Army also bought more UH-1B's, CH-47A's, OH-1 fixed-wing aircraft, and trainer planes. It selected the Hughes Tool Company's OH-6A as the winner of its light helicopter observation competition, and placed orders for more than 700 of these craft, to be delivered over the next three years.

Navy. The Navy and Marine Corps, with 8,391 aircraft on June 30, 1964, and 8,250 on June 30, 1965, sought authority to add 659 during the 1966 fiscal year.

The Navy set up a fund to buy probably from 1,000 to 1,500 of the A-7A light attack aircraft, designated as the Corsair II, and in November received the first deliveries. It also allotted funds for improved versions of the F-4, and created an initial large-scale fund for purchasing the F-111B, its version of the tri-service fighter.

Of existing aircraft, the Navy continued buying the P-3A Orion antisubmarine warfare (ASW) aircraft, the C-2A carrier delivery plane, the TA-4E and T-2 trainers, and the CH-46A, UH-46A, and CH-53A helicopters. It also stepped up orders for the A-6A and A-7A, but lowered its purchases of the SH-3D helicopter and the S-2E ASW craft, which is likely to be discontinued in fiscal 1966. Procurement of the E-2A was stretched out. More than 50 F-8 Crusaders were being reconverted for use in reconnaissance.

Looking toward the future, the Navy was designing the V SX for antisubmarine warfare, for which it also intended to use more helicopters.

Plans also were made for carriers to have an increased ratio of attack planes and more reconnaissance aircraft.

NORTH AMERICAN'S OV-10A became the U.S. Navy's choice for use as a light counterinsurgency aircraft in Vietnam.

AVIATION WEEK AND SPACE TECHNOLOGY

CIVIL AVIATION

Commercial airlines, private and business planes, air cargo transports, and airports all showed increased activity in 1965. Civil aircraft registered with the Federal Aviation Agency on Jan. 1, 1965, totaled 88,742 general craft and 2,193 planes in the commercial air fleet. On the same date, 431,041 pilots were registered with the FAA, an increase over the 378,700 registered in the previous year.

Supersonic Transport. Research continued in 1965 on a U.S. supersonic transport (SST). In July, President Johnson announced an 18-month, \$220 million study contract under which parallel research would be conducted by two airframe manufacturers, Lockheed and Boeing, and by two engine manufacturers, General Electric and Pratt & Whitney. The research will continue until January 1967, when a decision will be made on whether to build test planes. The president said "much work must be done" before proceeding with construction, but critics felt that the SST project should move faster.

The schedule for producing a 2,000-mph SST in the United States had slipped behind the schedule for the competing but slower (1,500 mph) British-French SST, the Concorde. Estimates placed the Concorde's first flight in 1968 or 1969, and its certification for use in 1971. The timetable for the American SST suggests it will be certified in 1974 or 1975. The USSR indicated it will have its own supersonic transport flying before the Concorde.

Tests were run by the National Aeronautics and Space Administration on the feasibility of building a hypersonic aircraft with a speed of from 2,000 to 5,000 mph. This plane would be introduced in the 1970's.

Aircraft Production. The combined production of civil and military aircraft in the United States in 1965 was estimated at 15,000. In the preceding year, the output totaled 10,053 civil craft and about 2,000 military craft.

U.S. commercial airlines increased their purchases in 1965, buying about 300 units worth a total of \$1.5 billion. They ordered more 4-engine and 3-engine jets, and began receiving quantities of twin-engine jets for short hauls. Many local-service carriers added twin-turboprop equipment. United Air Lines announced the biggest single outlay for commercial aircraft—a record \$375 million

(TOP) U.S. AIR FORCE; (BOTTOM) LOCKHEED

for 75 jetliners, all but nine ordered from Boeing. Boeing and Douglas announced that they would offer a new version of their standard airline aircraft that will accommodate 200 passengers. At the end of 1965, U.S. airlines owned approximately 850 pure jet aircraft.

Airports. There were 9,490 civil and joint civil-military airports in the United States at the beginning of 1965, an increase of 676 over 1964. The FAA allotted a record \$84.5 million (\$75 million plus carryover) for the construction and improvement of 445 airports in fiscal year 1966. The money was allotted mainly to airports used by

RUSSIAN MI-8, a twin-turbine helicopter shown flying at the Paris air show, carries 28 passengers.

SHORT-RANGE JETS joined the U.S. commercial air fleet in greater numbers in 1965. British Aircraft Corporation's 111 (left) and the Douglas DC-9 enabled regional airlines to supply jet service for flights as short as 200 miles.

DOUGLAS AIRCRAFT

commercial air-taxi operators or to general-aviation airports to relieve congestion at metropolitan airports.

Air Traffic Control. The FAA continued to expand its semiautomatic air traffic control system and planned to test the National Airspace System at Jacksonville, Fla., in 1967. Full modernization of air traffic control was scheduled for completion in 1970.

The FAA also announced that it would conduct one-year tests of two techniques using equipment that, for the first time, will give constant 3-dimensional radar pictures of air traffic—the Advanced Radar Traffic Control System (ARTS) and the Stored Program Alpha-Numerics (SPAN). In the tests, radar-return blips are electronically assigned descriptive luminous letters and numerals (alpha-numerics). These are grouped into tags (data blocks) that follow each radar blip across the controller's radar screen and give flight information. The tags, displayed by computer equipment, provide continuous identity and show the aircraft's position, as well as the altitude of those aircraft with automatic altitude-reporting transponders.

Airline Business Volume. U.S. air carriers reported all-time records in air travel and profits in 1965. In the first half of 1965, scheduled U.S. domestic and international carriers flew 31,587,055,000 revenue passenger-miles, up sharply from the 27,429,224,000 miles recorded in the first half of 1964. Available seat-miles rose to 58,337,368,000, up from 50,672,862,000.

In 1964, U.S. scheduled carriers (domestic and international) served 81,774,000 passengers, compared with 71,414,000 in 1963. Other 1964 figures

included: revenue passenger-miles, 58,493,600,000 (50,361,200,000 in 1963); available seat-miles flown, 106,315,600,000 (94,843,600,000); and air freight ton-miles, 1,301,488,000 (1,025,660,000).

The International Civil Aviation Organization reported that the airlines of non-Communist countries flew 156 million passengers a total of 107 billion passenger-miles in 1964, compared with 135 million passengers and 91.5 billion passenger-miles in 1963.

Other Developments. Air cargo continued to grow rapidly, and indications were that the volume of air cargo in 1965 would be more than 20% greater than in 1964. Cargo rates generally moved downward.

Transatlantic passenger fares were reduced in September. Within the United States, family fares were reduced, as were some long-haul fares. Airlines sponsored promotional programs to spur travel within and to the United States. Because of the airlines' increased financial strength, the Civil Aeronautics Board indicated that it would not grant any fare increases.

AEROSPACE INDUSTRY

The U.S. aerospace industry operated at a record level in 1965. The industry had expected a decline below the \$20.7 billion sales of 1964, but increased military expenditures by the U.S. government in support of the Vietnam war brought sales up to about \$20.9 billion in 1965. The earnings-to-sales rate was 2.3% in 1963, 2.6% in 1964, and 3.1% in 1965.

The U.S. aerospace industry is subject to wide fluctuations because of increases and decreases in military contracts. To meet this situation, the industry began in 1965 to investigate the possibility of entering nonaerospace fields to widen its base of support. Oceanology was one field considered adaptable to the technical skills of the aerospace industry. Road construction, shipbuilding, and nuclear technology were also considered.

Sales and Orders. In 1964 the aerospace industry had sales of \$20,716,000,000, including \$8,760,000,000 in aircraft, \$5,311,000,000 in missiles, \$4,761,000,000 in space vehicles, and \$1,883,000,000 in non-aerospace fields. Missile revenue declined in 1965, while other types of revenue increased. The backlog of orders on June 30, 1965, stood at \$16,762,000,000 for aircraft, missiles, engines, and space

FINANCIAL STATISTICS—U.S. SCHEDULED AIRLINES, DOMESTIC AND INTERNATIONAL

vehicles, compared with a backlog of \$9,470,000,000 in the first half of 1964.

Employment. The aerospace industry employed 1,117,000 persons at the beginning of 1965—57,000 less than in 1964. However, by the end of the year the number of jobs had increased to about 1,132,000. The industry's payroll was \$8.6 billion in 1964.

OTHER COUNTRIES

The USSR unveiled the world's largest airplane, to provide the major aerospace development outside the United States in 1965.

USSR. The AN-22 (or Antaeus), a 250-ton turbo-prop transport said to be able to carry an 80-ton cargo or 700 passengers, was exhibited at the international air show in Paris. The plane is powered by four 15,000-horsepower engines and has a maximum speed of 460 mph. Its length is 187 feet, and its wingspan 211 feet—both less than the dimensions of the planned C-5A. The USSR displayed other new aircraft at the show: a giant Mi-6 helicopter, an 186-passenger rear-engine jet, and the Mi-10 flying crane. The Russians also showed a model of the Tu-144 supersonic transport that will carry 121 passengers at 1,553 mph.

Britain. The British government ordered the 1,600-mph U.S. Phantom II fighter and canceled its own P.1154 project for a competitive plane. It also canceled the Hawker Siddeley HS-681 VTOL transport in favor of the American-made Hercules C-130E. The TSR-2 tactical strike reconnaissance aircraft also was canceled, and there was talk of ordering the U.S. F-111 to replace it.

Canada. The Canadian government committed itself to use the U.S.-made supersonic F-5 Freedom Fighter and placed orders for about 125 of these planes. After reevaluating its defense needs, Canada began building a tactical air force.

West Germany. The West German aeronautic industry continued to develop and build engines and aircraft capable of vertical takeoffs and landings.

AFGHANISTAN

A new and more liberal constitution for the kingdom of Afghanistan, adopted in September 1964, was gradually put into effect during a 13-month transition period, which covered most of 1965. In March, Communist China extended its influence in the country by means of a \$28 million, long-term, interest-free loan. The United States and the Soviet Union already were providing financial assistance to the Afghan economic development program.

National Elections. To implement the 1964 constitution, elections to the House of the People (*Wolesi Jirga*), the lower house of the new national

AFGHANISTAN · Information Highlights

Area: 253,861 square miles.

Population: 15,227,000 (July 1, 1964 est.).

Chief Cities (1964 est.): Kabul, the capital, 400,000; Kandahar, 119,000; Herat, 62,000; Gardez, 46,000.

Government: King—Mohammed Zahir Shah (b. 1914; acceded 1933). Premier—Mohammed Hashim Maiwandwal (took office Oct. 29, 1965). Parliament—Wolesi Jirga, or House of the People, 216 members; Meshrano Jirga, or House of Elders, 79 members.

Religious Faith: Muslim, 99% of population.

Education: Literacy rate (1963), 10% of the total population. Total school enrollment (1962)—310,185 (primary, 277,004; secondary, 20,850; teaching—training, 2,974; technical, 6,853; higher, 2,504).

Finance (1965 est.): Domestic revenues, \$74,100,000; domestic expenditures, \$55,000,000; monetary unit, afghani (45 afghanis equal U.S.\$1).

Cost of Living (1961, in Kabul): 98 (1958=100).

Manufacturing (metric tons, 1963): Cement (1964), 125,000; fuel briquettes, 20,000; beet sugar, 9,000; woven cotton fabrics, 33,000,000 meters; woven rayon and acetate, 300,000 meters.

Crops (metric tons, 1963): Wheat, 1,967,000; maize, 713,000; barley, 378,000; cottonseed, 73,000; sugar beets, 56,000; wool, greasy (1962), 23,600.

Minerals (metric tons): Coal (1963), 98,000; salt (1964), 24,000; lapis lazuli (1963), 5.

Foreign Trade (1963): Exports, \$68,989,000 (chief exports, 1963: karakul skins, \$17,316,000; fruits and nuts, \$14,419,000; raw cotton, \$12,637,000; wool, \$7,415,000; imports, \$125,709,000 (chief imports, 1963: petroleum products, \$9,331,000; wheat, \$7,309,000; electrical machinery and appliances, \$4,493,000). Chief trading partners (1963): USSR (took 31% of exports, supplied 51% of imports); U.S. (took 16% of exports, supplied 18% of imports); India (took 13% of exports, supplied 8% of imports).

Transportation: Roads (1964), 4,045 miles (79% paved); motor vehicles (1964), 17,200 (automobiles, 7,000); national airline, Ariana Afghan Airlines; principal airports, Kabul, Kandahar.

Communications: Telephones (1964): 9,200; radios (1963), 25,000; newspapers (1962), 14 (daily circulation, 64,000).

legislature, were held by the government of Premier Mohammed Yusuf beginning Sept. 1, 1965. Elections also took place for the House of Elders (*Meshrano Jirga*), the partially elective upper chamber. Women voted for the first time in the 1965 elections, and the newly constituted legislature, which convened at Kabul on October 14, included four women among the 216 members of the lower house.

Premier Yusuf formed a new cabinet, which was approved by the legislature on October 24. However, he resigned four days later, following a series of antigovernmental demonstrations. Mohammed Hashim Maiwandwal, a former ambassador to the United States, was named as Yusuf's successor.

Economic Development. Early in 1965 the government was faced with serious financial difficulties and a shortage of foreign exchange. These economic problems threatened to delay the current five-year plan (1962–66) for modernizing Afghanistan's predominantly herding and agricultural economy and for developing transportation, mining, and industry. When Marshal Chen Yi, the foreign minister of Communist China, paid an official visit to Kabul on March 22–24, he offered a badly needed \$28 million development loan. The loan and other economic and cultural agreements were successfully negotiated during his visit. In 1965, construction was pushed on the national highway network, and the Jalalabad Canal, designed to irrigate 75,000 acres in southeastern Afghanistan, was completed.

Foreign Relations. In addition to drawing closer to the Chinese People's Republic, Afghanistan sought to retain good relations with both the Soviet Union and the West, in harmony with its policy of nonalignment. In August, King Zahir Shah, who had visited Peking in October–November 1964, paid a state visit to Moscow. In February 1965, Premier Yusuf spent ten days in New Delhi to promote closer cultural and trade relations with India.

PAUL L. HANNA

Professor of Social Sciences, University of Florida

AFRICANS cheer British Prime Minister Wilson on his arrival in Rhodesia on October 25. Wilson failed to prevent the Ian Smith government from declaring Rhodesia's independence.

AFRICA

Compared with the early 1960's, there was a lack of spectacular events in Africa during most of 1965, and world attention shifted to greater emergencies in Asia and Latin America. The relative quiescence in Africa was welcome, because economic development, the continent's greatest need, is not likely to be achieved except under conditions of political stability.

The most jarring note was struck in the small, self-governing British colony of Rhodesia, where the government, failing to win Britain's consent, declared its independence on Nov. 11, 1965. Britain had refused to grant independence to Rhodesia without guarantees that the government, dominated by the country's 220,000 whites, would provide for eventual majority rule by the 4,000,000 Africans. Elsewhere, the Algerian government was overthrown in June, but other regimes seemed durable until a rash of military coups swept western and central Africa late in the year. Between Nov. 25, 1965, and Feb. 24, 1966, governments were ousted in the Congo (Léopoldville), Dahomey, the Central African Republic, Upper Volta, Nigeria, and Ghana.

Aside from these internal problems, there were a number of situations and trends, some with broad international significance, that commanded the notice of African specialists during 1965. Among these developments were signs of fragmentation among African states, rather than any measurable progress toward unity; Communist China's replacing Russia as the main threat of Communist influence in Africa; and the persistence of white supremacy in southern Africa, despite pressures to achieve majority rule.

One conclusion that may be drawn from the events of 1965 is that the division of African states between conservative and revolutionary blocs continues to be a feature of the contemporary African scene. In the early 1960's this cleavage had been very sharp, and African observers distinguished between the "Brazzaville" (conservative) and "Casablanca" (radical) groups. With the founding of the all-encompassing Organization of African Unity (OAU) at Addis Ababa, Ethiopia, in May 1963, this cleavage supposedly was eliminated. It was expected that, under the OAU, lesser groupings would

be abandoned in the name of African unity. During the first two years of the OAU's existence this was the case to a large extent.

Conservative Groupings: the OCAM. In 1965 a bloc of conservative-leaning, French-speaking African states created the Organisation Commune Africaine et Malgache (OCAM) within the broader framework of the OAU. These states, members of the former Brazzaville group, had an admirable record—virtually unique in Africa—of mutual cooperation in financial, administrative, and military matters, not only among themselves, but also with their former imperial ruler, France.

In 1961, the Brazzaville states had created political ties among themselves by forming the Union Africaine et Malgache (UAM). The UAM was allowed to lapse in 1964, in deference to the OAU. It was replaced by the Union Africaine et Malgache de Coopération Economique (UAMCE), a looser body, limited to economic objectives and largely inactive.

The founding meeting of the OCAM was held in Nouakchott, Mauritania, on Feb. 10–12, 1965. The countries represented by heads of state were the Ivory Coast, Dahomey, Upper Volta, Niger (these four forming the especially close-knit group known as the Conseil de l'Entente), Togo, Gabon, the Malagasy Republic, Chad, Senegal, Cameroon, Mauritania, and the Central African Republic. The Republic of the Congo (Brazzaville) was represented only at the ministerial level and subsequently dissociated itself from certain passages in the communiqué issued at the end of the meeting. Enthusiasm for reviving the UAM, or creating something akin to it, was strongest among the first seven of the states listed above. The others, while willing to seek broader bases for cooperation than those that currently existed, were anxious to avoid political alliances that would seem to undercut the OAU. As a result, the OCAM amounts to a compromise between the political UAM and the economic UAMCE.

Three main motives, deeply intertwined, influenced the delegates at Nouakchott. First, there was discontent over the ability of the OAU to handle the explosive problems posed by the Congo (Léopoldville) because the question of whether to support the Congo's Premier Moïse Tshombé (since ousted) or to aid the Congolese rebels had split the OAU. Sec-

ond, there was apprehension over the extent of Chinese Communist subversive activity in Africa, abetted by some African states. Third, there was a feeling that no Pan-African organization can be expected to work when some African states fail to respect the territorial integrity of their neighbors. (In this regard, the Brazzaville states particularly resented Ghana, which had served as a refuge for seditious groups from other African nations.)

The final communiqué from Nouakchott, announcing the creation of the OCAM, made no outright mention of China, but China was clearly meant by the reference to "covetous designs from abroad." The references to Ghana and the Congo were more specific:

"Considering that the malaise from which the OAU is suffering derives essentially from the lack of respect given to its Charter;

"Considering that respect for the sovereignty of the states, and noninterference in their internal affairs, constitute the *sine qua non* conditions for peace and development in Africa. . . .

"The Chiefs of State of the Organization . . . solemnly affirm the urgent necessity of bringing peace back to Congo (Léopoldville) through aid to the legal government to hasten national reconciliation in order and liberty. They energetically condemn the action of certain states, notably Ghana, which harbor agents of subversion and organize training camps on their national territory."

Nine of the OCAM heads of state met again on May 25-26 at Abidjan, Ivory Coast. They approved the admission to the organization of the Congo (Léopoldville) and resolved to boycott the OAU summit meeting scheduled for September in Accra, Ghana. During the year, Rwanda also joined the OCAM, and Mauritania left, so that at the end of 1965 the members included Cameroon, the Central African Republic, Chad, the two Congos, Dahomey, Gabon, the Ivory Coast, the Malagasy Republic, Niger, Rwanda, Senegal, Togo, and Upper Volta.

Disharmony in the OAU. Members of the Organization of African Unity demonstrated little unity during 1965. There was a lack of accord among members on a common policy toward the Congo, and several governments charged their neighbors with aiding political refugees in launching subversive plots. However, all members were able to agree on condemning the minority white government of Rhodesia.

The fourth ordinary session of the OAU Council of Ministers met in Nairobi, Kenya, from February 26 to March 9. Congolese Premier Tshombe was present, and, while he failed to secure the African peacekeeping force he requested, he escaped the criticism liberally dealt him at past OAU meetings.

The Council of Ministers met again in an emergency session at Lagos, Nigeria, June 10-13, to hear charges by Niger, the Ivory Coast, and Upper Volta that Ghana's sponsorship of subversive groups should disqualify Accra as the site of the proposed heads of state conference. Noting that Ghana had offered to expel undesirable refugees, the ministers voted to hold the meeting at Accra and to examine the problems of refugees and subversion there.

The summit meeting, originally scheduled for September, finally took place at Accra, October 22-26. Seven OCAM members boycotted the talks, and 11 other states sent lower level delegations, so that only 18 of the 36 heads of state were present. The conference issued a resolution urging Britain to take over the administration of Rhodesia by force to prevent the Rhodesian government from unilaterally declaring independence. They also condemned subversion by political refugees.

Disunity in East Africa. Not only did the unity of the OAU appear to be weakened in 1965, but also,

TANZANIAN FARMER (right) is taught how to operate a tractor by his Communist Chinese agricultural instructor.

regrettably, international cooperation in East Africa, where it had existed for many years. Under British rule, Uganda, Kenya, and Tanganyika had a network of common services, which were maintained after independence. In fact, for a time, there was enthusiastic talk of forming a federal union among the three participants.

The events of 1965 destroyed the hope of union and may even have endangered existing cooperative efforts. President Jomo Kenyatta of Kenya, a political moderate, was forced by a number of incidents to assume an increasingly critical attitude toward the revolutionary tendencies shown by Tanzania (the union of Tanganyika and Zanzibar). Finally, Tanzania tore the fragile fabric of East African unity on June 10 by withdrawing from the common currency arrangement with the other two countries. This was done after a visit to Tanzania by Communist China's Premier Chou En-lai, who concluded trade and aid agreements with Tanzania.

Late in the summer, the heads of state of Kenya, Uganda, and Tanzania became concerned over the economic losses likely to accrue from abandoning their common market and common services. They met several times, and on September 1 they issued a statement confirming their decision to maintain and strengthen the regional institutions. Nevertheless, the three nations were estranged, although some hope of economic cooperation remained.

NIGERIA experienced political friction and rioting during most of 1965, leading to the overthrow of the civilian government on Jan. 15, 1966. (Left) Tear gas squad subdues rioters in Ikenne, Western Nigeria, on Nov. 28, 1965.

THE CONGO (Léopoldville) changed governments on Nov. 25, 1965, when General Mubutu (seated) seized power in a bloodless coup d'état.

PICTORIAL PARADE

AFRICA underwent political change in 1965. Tiny Gambia achieved independence February 18, and white-controlled Rhodesia declared independence November 11. The Algerian government was overthrown June 19, and military coups occurred in six western and central African republics between Nov. 25, 1965, and Feb. 24, 1966.

CONGO SHAKEUP: Gen. Mobutu (r.) stepped into a power struggle between President Kasavubu (bottom l.) and ex-Premier Tshombe (top l.) and assumed presidency on November 25. Col. Mulumba (center) became premier under Mobutu.

Afro-Asian Conference. Africa was to have provided the setting for the second conference of African and Asian heads of state—the so-called Second Bandung Conference, the first having been held in Indonesia in 1955. The new meeting originally was scheduled to open on June 29 in Algiers, but after days of hesitation and negotiation among the participants, it was postponed to November 5. Three days before the rescheduled opening, however, a preliminary foreign ministers session postponed the conference indefinitely. Basically, few states seem to have wanted the conference, and the postponement made clear that little hope had existed for any positive outcome. (See also ASIA.)

Gambian Independence. Gambia, Britain's oldest and smallest colony in West Africa, became independent on February 18, bringing the total number of independent African nations to 37. The following day, Gambia signed treaties with neighboring Senegal, laying the foundation for a cooperative effort without which tiny Gambia might not survive.

The Congo (Léopoldville) Situation. The former Belgian Congo, for four years the sick man of Africa, showed some modest signs of returning to stability in 1965. The various rebel groups, no longer able to maintain serious warfare against government forces, were reduced to hit-and-run operations, and to infiltrating areas without permanent garrisons.

Early in the year the prestige of Premier Tshombe seemed to be growing. His CONACO party won the spring national elections, and he was gaining reluctant acceptance from other African states. However, there were signs of a coming power struggle between Tshombe and President Kasavubu.

On October 13, at the opening session of the new parliament, Kasavubu dismissed Tshombe, saying that the constitution required his resignation. Kasavubu named Evariste Kimba, once foreign minister under Tshombe in secessionist Katanga Province, as the new premier. Kimba pledged a coalition government of "national union," but Tshombe refused to bring his CONACO party into the coalition. On November 14 he succeeded in blocking parliamentary confirmation of the Kimba government. Then, on November 25, Gen. Joseph Mobutu ousted Kasavubu in a bloodless coup and took power himself. In his words, "the race for the top [was] finished."

Upheavals in Western and Central Africa. The coup in the Congo was the first of six successive government upheavals in western and central Africa within three months. It was followed by the downfall of President Sourou Migan Apithy of Dahomey on November 29, President David Dacko of the Central African Republic on Jan. 1, 1966, President Maurice Yaméogo of Upper Volta on January 4, Prime Minister Sir Abubakar Tafawa Balewa of Nigeria on January 15, and President Kwame Nkrumah of Ghana on February 24. In all cases, military forces overthrew civilian governments, expressing discontent over failures to solve economic and social ills. While contagion may have been a factor, there was no evidence of interconnection or outside instigation. The coups were strikingly similar because they were precipitated by domestic situations common to underdeveloped African states.

North Africa. On June 19, 1965, Algeria's President Ahmed Ben Bella was ousted in a military coup by Col. Houari Boumedienne. In July, France concluded a long-term oil and gas agreement with the new government, giving Algeria a larger share in oilfield profits, but retaining rights to these fields and to military bases in Algeria.

Ben Bella's disappearance from the scene left President Nasser of Egypt with one less rival as the leading radical nationalist of Africa. However, a new rival appeared in the person of President Habib Bourguiba of Tunisia, who adopted an attitude of outright criticism of what he called Nasser's "hegemony" over Arab League policy.

Southern Africa. In southern Africa, the remaining area of white supremacy on the continent, there was no substantive trend toward majority rule. In fact, the only changes were in the direction of strengthening the status quo.

In Rhodesia the election of May 7 resulted in an overwhelming victory for Prime Minister Ian Smith's ruling Rhodesian Front party. After Britain refused to grant Rhodesia independence without guarantees for majority rule, Smith threatened to declare independence. Support for Britain and condemnation for Rhodesia came from the OAU, the UN Security Council and General Assembly, and many nations. Negotiations between Britain and Rhodesia having broken down, Smith issued a unilateral declaration of independence on November 11.

In the large Portuguese colonies of Angola and Mozambique, attempts dwindled during the year to overthrow the existing regimes by rebellions supported from the outside (see PORTUGAL). In the Republic of South Africa, home of the policy of racial segregation known as apartheid, there were no disorders such as occurred in former years, and the government seemed to be attaining its objectives. Even critics were obliged to concede that the "Bantustan" policy of creating "Bantu homelands" within South Africa appeared to be working in Transkei, the first homeland, and the government planned to create a Zulu state as the second.

The three remaining British territories in Africa—Bechuanaland, Basutoland, and Swaziland—were scheduled to become independent under majority rule in 1966. All are geographically and economically dependent on South Africa, and their leaders have expressed interest in trading with South Africa despite objections to apartheid. AGRICULTURE

Major trends and events in agriculture in 1965—record crops, scientific advances, and expanded government services—are reviewed in this article under the following headings: (1) U.S. Agriculture in 1965; (2) Agricultural Research; (3) Farm Services.

U.S. AGRICULTURE IN 1965

American farmers set another crop record in 1965, pushing both yield per acre and total production to new highs. However, livestock production dipped slightly from the record high of 1964.

Gross farm income reached a new high of \$44.2 billion, up from \$42.2 billion in 1964. But production expenses also increased to a record \$30.2 billion, leaving \$14 billion in net cash income—the highest total since 1952 and about 8% more than in 1964.

Net income per farm rose about 10% during 1965—from \$3,727 to \$4,100. The gain reflected the higher overall farm income and the departure of some 550,000 persons from farming during the year. It represents an increase per farm of about 40% over the past five years.

Farm Income and Prices. The increase in farm income stemmed from substantially higher prices for livestock and livestock products (including poultry and eggs), and increased direct government payments. About \$1.75 billion of the increase in gross farm income was credited to the 8% rise in prices for livestock products. Direct government payments totaled \$2.4 billion, up from \$2.17 billion in 1964. Average crop prices dropped about 3%, but marketing volume remained the same as in 1964. Average farm prices received in 1965 stood about 4% above those of a year earlier. Total cash receipts from marketings in 1965 were estimated at 5% over those of 1964.

Led by a jump of about 35% in the price of hogs, meat-animal prices advanced 16% over those of 1964. Poultry prices rose 5% despite a 7% increase in marketings. Wholesale milk prices also advanced from the 1964 levels.

Lower cash receipts from wheat reflected a lower loan rate on the 1965 crop. Increased direct payments to producers kept the decrease from becoming substantial. Lower cash receipts for corn resulted from a 1964 crop so small that it more than offset slightly higher prices. More soybeans were marketed in 1965, at prices 10% higher than a year earlier. Cash receipts from cotton fell slightly, mainly because of lower prices and a lag in processing raw cotton at gins.

Production expenses climbed, with motor vehicles, machinery, fencing and building materials, feed, and feeder livestock costing more. The index of prices paid by farmers for production items, interest, taxes, and wage rates showed levels about 22.5% higher than in 1964.

Food Production. The U.S. all-crop production index (1957–59=100) advanced to 117, well above the 109 of 1964 and even above the record 112 in 1963. The per-acre yield index for 28 crops soared to an estimated 123, a record 6% over the previous high of 1963.

Crops planted for 1965 harvest totaled nearly 308 million acres, up 1.5 million acres from a year earlier but slightly below the 1963 total. Plantings ran considerably above the record low of 301 million acres in 1962. Preliminary estimates of crop production placed the year's key increases at about 22% for

soybeans, 16% for feed grains, and 5% for wheat.

Meat and poultry production slipped slightly, dropping to 39.67 billion pounds in 1965 from 40.39 billion pounds in 1964. Milk marketed totaled about 125.5 billion pounds, slightly below the record 126.6 billion in 1964.

Food Consumption. The average American ate slightly less food in 1965. The per capita food consumption index (1957–59=100) slipped to 101.4 for the year, down from 102 in 1964—the highest point in five years. Meat and poultry consumption per person dropped by 4.8 pounds to 208.4 pounds. The average American ate 99.3 pounds of beef, second only to 100.4 pounds in 1964. He bought almost 5 pounds less pork, for a total of 60.2 pounds—the lowest average since 1958. Veal, lamb, and mutton consumption also dropped. The consumer ate seven less eggs during the year, and about the same amount of fish and vegetables as in 1964. Consumption of all dairy products except cheese and ice cream was off slightly. Some gains occurred, and the average individual ate 4% more chicken (or 33.1 pounds) than in 1964, slightly more turkey, and considerably more fruit.

Agricultural Employment. The index of farm wage rates (1957–59=100) increased to a new high of 125 in 1965, up six points from a year before. Wages averaged 93 cents an hour in 1965, up three cents in a year. The farm work force declined about 10% in 1965 from the 6,110,000 in 1964. The hired labor bill for 1965 was lower than in 1964, because the reduction in hired workers more than offset the increase in farm wage rates.

Farm Assets and Land Values. The market value of farm real estate on Jan. 1, 1966, totaled an estimated \$170 billion, up \$10.6 billion (6.6%) from a year earlier. The value of all agricultural assets, including crop and livestock inventories, was estimated at \$253.2 billion on Jan. 1, 1966, up \$15.4 billion in a year. Liabilities against these assets, including debt on real estate and loans from other creditors, was estimated at \$41.1 billion, leaving a balance of \$212.1 billion in agricultural equities (up \$11.8 billion).

Agricultural Exports. For the second year in a row, exports of U.S. farm commodities for the fiscal year ending June 30, 1965, totaled a record \$6.1 billion. Commercial sales fell just short of the \$4.5 billion in the fiscal year 1964. Heavier overseas shipments both before and after the longshoremen's strike in January and February made up for reduced exports during that period. Exports of corn, soybeans, oil-

U.S. ALL-CROP PRODUCTION INDEX

seed products, and some animal products increased their pace of a year earlier. Wheat exports dropped slightly, to 728 million bushels.

Farm Legislation. Major shifts in agricultural policy came in an omnibus farm bill, signed by President Johnson Nov. 5, 1965, and effective in 1966. The legislation set commodity programs through 1969 to give the nation the longest program for major crops it has had since World War II. The legislation made major changes in the cotton program, dairy production controls, long-term land retirement, and government purchases. It also altered the wheat and feed grains programs. In general, the legislation shifted subsidy policy further away from high government price supports and toward cash payments from the government to farmers.

As a result of the bill, the cotton, wheat, and feed grains programs include payments to farmers who divert acreage to other uses. The programs cut acreage allotments and hold price supports at or near the world price level.

For wheat growers, a voluntary two-price system was enacted to return up to 100% of parity prices for wheat used by domestic food processors. The processor is required to pay the difference between the support level and \$2 a bushel (a difference of 75 cents in 1966) for domestic marketing certificates. The government pays the amount over \$2 necessary to bring the total return per bushel to 100% of parity (about \$2.56 in late 1965).

Growers complying with wheat provisions in 1966 become eligible for price-support loans (averaging \$1.25 a bushel), plus certificate and diversion payments. Compliance requirements are largely unchanged from 1964. However, diversion payments are authorized on additional voluntary diversions up to 50% (previously 20%) of farm allotment or on total diverted acreage up to 25 acres—whichever is larger.

The voluntary feed grains program for corn and grain sorghums was continued except for three changes. These allowed (1) producers to substitute soybeans for feed grains under certain conditions on permitted feed grain acreage; (2) price support payments-in-kind to be varied and made on only a part of acres planted for harvest; and (3) barley to be included under the program in 1966 with certain conditions.

The new law allows cotton growers, for the first time, to come under the acreage diversion system used for wheat and feed grains. This will enable growers to cut production without suffering net income loss. It sets a one-price cotton plan under which mills obtain supplies at world prices. A 16-million-acre minimum allotment is provided, and price support ranges between 65% and 90% of parity. The law establishes farm domestic allotments at not less than 65% of the farm acreage allotment.

Cooperators in the cotton program may plant at least 87.5% of their farm allotment in 1966. They will receive diversion payments of at least 25% of parity (10.5 cents per pound is indicated for 1966) on acres not planted, and price support payments at 9.42 cents per pound on domestic-allotment production. In addition to receiving price-support and diversion payments, a grower may divert further cotton acreage to conserving uses and get additional payments based on rates up to 40% of parity. A special provision allows small farmers to obtain benefits without diverting acreage.

The law sets the minimum resale price of government cotton stocks at 110% of the price-support loan

cost (21 cents in 1966, compared with 29 cents in 1965), which can be no more than 90% of the average world market price. Also established is a national export market acreage reserve of up to 250,000 acres to be used for export crops. Farmers obtaining a share of this reserve must sell all their 1966 cotton for export and give up price support on all cotton grown on their farm.

A new program encourages farmers to leave cropland unplanted. Similar to the Soil Bank started in 1956, the cropland adjustment program makes rental payments to farmers who retire at least the allotment or base acreage of a crop for 5 to 10 years. Adjustment payments may be made on an annual, lump sum, or installment basis. They are negotiated by means of bids.

Participating farmers qualify to share with the government the cost of seeding idled land, adopting soil and water conservation practices, and building ponds and planting trees. Most acreage also qualifies for wildlife service payments to permit public access for hunting, trapping, hiking, and other recreational purposes.

The government will arrange for retiring up to 40 million acres of cropland and placing it in conservation uses. A sum of \$225 million is provided in 1966 for the first of four years in which farmers can sign to participate in the program. Acreage retired can include whole farms, but total acreage is limited in any one community.

The new farm law permits the government to buy dairy products, except fluid milk, at market prices when Commodity Credit Corporation stocks are insufficient to meet needs of school lunch, Food for Peace, and other foreign and domestic programs.

Another change authorizes, through 1969, referendums by producers for adoption of milk marketing programs—known as Class I base plans—in the 75 federal milk markets. Producers who qualify retain their share of higher-priced Class I sales when they cut back total production from the level of an assigned base or quota. The balance, normally designated Class II milk, will be marketed at the lower price level for milk used in manufacturing. Approval requires a two-thirds majority of the individual producers who vote in the referendum.

Other important farm legislation: (1) extended indemnity payments to dairy farmers who had milk banned from markets because it contained residues of pesticides registered and approved by the government at time of use; (2) appropriated \$20 million for matching grants to help develop water-supply and sewage-disposal systems in rural areas; and (3) provided authority for acreage-poundage quotas (approved by growers in a 1965 referendum) in place of existing acreage allotments for the 1965 flue-cured tobacco crop, and for other tobacco, beginning in 1966. RAY REIMAN
President, Farm Business, Inc.

AGRICULTURAL RESEARCH

The Agricultural Research Service (ARS), an agency of the U.S. Department of Agriculture, conducts research concerned with farming, human nutrition, clothing and textiles, consumer and food economics, marketing, and new uses for agricultural products. The agency also conducts regulatory activities to control plant and livestock pests, to prevent the entry of such pests into the United States,

U.S. FARMERS increased efficiency in cattle feeding and hay storage in 1965 with a new "cubing" machine that can compress loose alfalfa into bite-size pellets.

and to assure that pesticides meet standards of safety and effectiveness. Much of the agency's work is accomplished in cooperation with state agricultural experiment stations.

Soil Research. Basic soil and water research produced a solar still that extracts drinking water from desert soils and plants for emergency survival. The still consists of a bowl-shaped hole in the ground, a sheet of plastic covering the hole, and a container placed beneath the plastic. Soil holds the edges of the plastic in place, and a rock in the center of the sheet weights it down to form an inverted cone. Water evaporated from the soil by solar energy condenses on the underside of the plastic and drips into the container. As much as two or three pints of water can be obtained daily.

Plant and Animal Research. Plant-growth research led to the isolation and identification of the "light switch" that can start and stop many plant growth processes. Researchers studied a protein molecule, called phytochrome, that acts in response to light to govern flowering, germination, and other plant-growth processes. They discovered that the switch is the molecule's chromophore (pigment), whose action depends on the light it receives.

New crop varieties released to growers and nurserymen in 1965 included a pecan with large, high-quality nuts; a strawberry especially suited for making jams and jellies; and a Bermuda grass variety for golf greens.

In special feeding tests, bull calves grew faster and more efficiently than their twins raised as steers, and were ready for slaughter two months sooner. Bull beef was tested and approved by consumers. This development may open new markets for bull beef, now primarily used in processed meats.

Ammonium chloride added to the diet of sheep and cattle protected them from urinary calculi ("water belly") disease.

Scientists learned how to remove lamb fetuses from ewes, make skin grafts from other sheep, and return the fetuses to the wombs. The lambs con-

tinued to develop, were born normally, and showed no scars. Surgical techniques worked out are being used in medical research aimed at preventing birth defects in humans.

Insect Control. A low-volume aerial-spray technique developed by ARS was used against the cereal leaf beetle and the boll weevil. This technique, in which undiluted malathion is applied in extremely small amounts, is safer, faster, and cheaper than the conventional aerial spraying of insecticides diluted with large amounts of water or oil.

Entomologists isolated and identified feeding stimulants for female houseflies. These substances cause hundreds of flies to cluster and feed on a small area of filter paper containing less than one-millionth of an ounce of the stimulant. Further research will seek to determine whether the materials have practical value for controlling houseflies.

Disease-carrying aphids that attack squash, cucumbers, and cantaloupes are repelled by the color of aluminum foil. When these crops were mulched with strips of foil they yielded about five times more than unprotected plants.

Automated Irrigation. Two fully automated irrigation systems were developed to conserve water and labor. The systems use radio signals to open and close inflatable valves at predetermined times, and are controlled from the farmhouse. Automated irrigation gives the farmer more precise control over the length of time he irrigates his fields and frees his time for other farm activities.

Nutrition and Product Research. Nutritionists studying the relationship of diet to body function and longevity found that rats which ate excessively and gained weight rapidly died at an early age, regardless of the composition of their diets. In nutrition, the combination of foods in the animals' diets appeared to play a bigger role than individual foods.

A method was developed to remove 80% of the oil and almost 75% of the calories from peanuts without impairing their flavor or protein content. The oil is pressed out of the peanut meats by a hydraulic

press. When soaked in water, the flat but unbroken nuts return to their original shape and size.

Data for Consumers and Industry. Studies showed that fat-based detergents are readily broken down in closed sewage systems, such as septic tanks, and will not cause foaming in streams and water supplies. However, petroleum-based (ABS) detergents were not broken down, and appeared to have a toxic effect on the microorganisms that were expected to digest them.

Oil of crambe—a new oilseed crop—was evaluated by industry for use in steel casting, new nylon products, and waxes. The meal remaining after the oil is extracted is 40 to 45% protein and contains most of the amino acids needed in animal feeds. However, the meal contains some undesirable components. Research showed that treating the seed or meal with ammonia in gas form or with ammonia in water successfully deactivated these substances.

Textile bacteriologists conducted exploratory experiments on bacteria that survive on clothes washed in cold-water detergents. Earlier studies had indicated that large numbers of bacteria survive warm- and hot-water laundering unless a disinfectant is added to the wash. The government researchers found that when no disinfectant was used, appreciably more bacteria survived cold-water washes than survived hot-water washes. However, the addition of chlorine or quaternary disinfectants lowered the bacteria count regardless of the water temperature.

Improved Food Handling. New loading patterns were developed to enable truckers to deliver bagged early potatoes in better condition to consumers. The new patterns allow better air circulation, thus reducing temperature and moisture conditions that damage early potatoes during shipment.

Studies showed that improved work practices and equipment can significantly speed up the receiving of grain sorghum at country elevators, and that the time required for weighing, unloading, and other receiving operations can be reduced without making major changes in plant layout. Elevator capacities can be increased 15% or more with proper adjustment and maintenance of elevating equipment.

Pesticides. ARS regulations protect the general public by requiring that manufacturers register pesticides with the secretary of agriculture before shipping them across state lines. Before a registration is granted, a pesticide must meet rigid tests that prove its claimed effectiveness against a particular pest or pests and that demonstrate its safety to humans, crops, livestock, wildlife, and other resources when used as directed. In 1965, Secretary of Agriculture Orville L. Freeman appointed a task force to study ways to streamline procedures now used to determine the safety and effectiveness of pesticides.

Results of a year's analysis of farm pesticide use in the Mississippi River delta showed no progressive buildup of pesticides in soil, sediment, and water. The study is part of a federal monitoring program begun in 1964. In 1965 the program was extended to parts of North Dakota, Minnesota, and Arizona.

Livestock Disease Eradication. Populations of the screwworm, a costly livestock pest, have been eradicated from all states except Arizona and California, and a cooperative eradication program was begun in these two states. In cooperation with Mexico, ARS established a living barrier of sexually sterile screwworm flies to prevent reinfestation of U.S. areas. A cooperative survey was undertaken in Mexico to learn more about screwworm problems.

Under joint state and federal eradication drives against animal diseases, the number of hog cholera outbreaks was cut in half in the leading hog-producing states—Illinois, Indiana, Iowa, Minnesota, and Missouri. For the United States as a whole, the number of confirmed outbreaks for the year fell below 900, compared with 1,117 a year earlier.

More than 86% of the counties in the United States had reduced the incidence of brucellosis in cattle to less than 1% by mid-1965. The disease had been eradicated from 470 counties in 25 states, the Virgin Islands, and Puerto Rico. All of Connecticut, Maine, Massachusetts, Rhode Island, Utah, Vermont, Wisconsin, and the Virgin Islands had achieved certified brucellosis-free status.

Efforts to eradicate brucellosis from swine continued, and validated brucellosis-free herds totaled 1,920, as compared with 1,667 a year earlier. There were 87 brucellosis-free counties (including all the counties in Vermont and Utah)—up 35 from mid-1964.

In the cattle-tuberculosis eradication campaign, 541 counties in 20 states and Puerto Rico were declared accredited tuberculosis-free.

Sheep scabies had been eradicated from 49 states, Puerto Rico, and the Virgin Islands, leaving only Iowa as an infected area.

Biochemical Research. ARS biochemists determined for the first time the molecular structure of one of the ribonucleic acids (RNA's). This research ultimately may lead to ways of altering the genetic characteristics of living organisms by modifying the structure of nucleic acids. Nucleic acids also play a role in cancer growth and virus-disease transmission.

Animal and Plant Inspection. Under laws protecting U.S. livestock from foreign diseases and pests such as ticks and mites, inspectors refused to allow 19,592 animals to enter the United States in the fiscal year 1965. The animals permitted to enter numbered 685,731.

In the fiscal year 1965, more than 30 million ships, planes, trains, and automobiles were inspected in an effort to keep out foreign plant pests. Inspectors reported 27,572 interceptions of insects, diseases, and other pests, and prevented the entry of 446,247 lots of prohibited plant material.

E.G. MOORE
Director, Information Division
U.S. Agricultural Research Service

FARM SERVICES

All four agencies assigned by the U.S. Department of Agriculture to provide loans, credit guarantees, crop insurance, and other services to people in rural areas set records in 1965. The Farmers Home Administration lent \$798 million—an all-time high. The Rural Electrification Administration provided \$477 million in expansion credit to electric and telephone systems. The Federal Crop Insurance Corporation wrote insurance valued at \$594 million on farm crop-production investments for nearly 16 million acres. The Farm Credit System lent a record \$6.6 billion to farmers, ranchers, and cooperatives.

Farmers Home Administration. In the fiscal year 1965 the Farmers Home Administration (FHA), which supplements credit from private sources, assumed a larger role in efforts to fight poverty, rebuild rural communities, and strengthen the family farm unit. The loans made and insured by the administration totaled a record \$798 million, as

against \$743 million in 1964, and benefited an estimated 1.8 million persons.

The agency stepped up its rural development efforts by lending more than \$50 million for rural water systems, \$133 million for rural housing, and \$1.6 million for pilot rural-renewal projects. It also granted \$19.6 million in economic opportunity loans to 11,022 low-income rural families.

Family farm loans, the oldest FHA program, provided nearly \$483 million in credits to 85,026 families. Farm-operating loans accounted for \$300.4 million of the total, and farm ownership loans to 12,186 families made up the rest.

The agency also extended \$78.5 million in emergency operating credit to farmers in areas hit by floods, drought, and other disasters. This amount brought to \$873 million the total lent under this program in the past 15 years.

Loans for the construction of modern, urban-style water distribution systems amounted to \$50 million for 388 projects in 33 states, as compared with \$34 million for 271 projects in 1964. This expanding program, totaling \$108.9 million since it was begun in 1961, has brought running water to more than 480,000 rural people. About two thirds of the total was in FHA-insured loans from private investors.

Rural-housing loans for construction and remodeling—a program begun 16 years ago but stepped up sharply in 1961—were granted to 15,814 families and rural groups in 1965. These loans included \$7,636,000 for rural housing for the elderly and \$2,065,000 for rental housing for farm workers and retired persons.

Loans outstanding at the end of fiscal year 1965 totaled \$2.75 billion, as against \$2.3 billion in 1964. Principal and interest repayments of \$512.3 million during 1965 were the largest in FHA history. The total lent under FHA auspices during its 30 years of operation amounted to \$6.85 billion.

Rural Electrification Administration. The more than 1,000 electric systems financed by the Rural Electrification Administration (REA) showed continued strong growth in fiscal year 1965. They reached \$1 billion in net assets, borrowed \$380 million for expansion, and made a record number of rate cuts.

A total of 132,776 rural consumers received electric service for the first time as a result of the new REA financing, which brings total plant investment by REA electric systems to nearly \$4.7 billion. Approved loans not yet invested in plant facilities will add an estimated 600,000 rural consumers and bring the 30-year total of REA loans to \$5.6 billion. By the end of fiscal year 1965, the systems had made \$2.26 billion in principal and interest payments. Interest alone totaled more than \$726 million.

REA's active borrowers serve an estimated 20 million people in 46 states and Puerto Rico, living on more than half the nation's 3.4 million electrified farms.

Rate cuts, representing annual savings of more than \$5 million, resulted from both growth and an increase in average monthly usage. Usage increased 122 kilowatt-hours (kw-hr) per customer between fiscal years 1960 and 1965.

The loan program also has provided financing for 5 million kilowatts of generating capacity—about 1% of the electric industry's total and enough to provide 18.2% of the total electric power needs of rural borrowers. The REA-financed companies buy 36.6%

U.S. FARM SURPLUSES

Less wheat and corn, more cotton

of their power from commercial companies and 45.2% from public sources.

Rural telephone systems, eligible for REA loans since 1949, expanded to provide service to more than 2 million subscribers. The agency loaned \$97 million to 170 cooperatives and commercial companies in the fiscal year 1965, increasing the 16-year total to almost \$1.17 billion. The 848 REA telephone systems reported net assets of \$112 million.

The rural telephone systems continued an accelerated program of upgrading service. This program included an expansion of single-party service as a result of investments of \$101 million during the fiscal year 1965. Investment in rural telephone plant totals more than \$1 billion. The telephone borrowers—623 commercial companies and 225 cooperatives—have made interest and principal payments totaling \$185 million; interest alone totaled nearly \$84 million.

Federal Crop Insurance Corporation. This corporation, which has provided financial protection against crop failure since 1939, continued to expand in 1965. It wrote insurance policies on \$594 million in crop-production investments, as against \$546 million in 1964. The 1965 insurance covered 455,618 crop investments on almost 16 million acres. This represented a gain of about 5,000 crop investments and one million acres over 1964. Insurance coverage protected farmers in 1,214 counties (27 more than the year before) in 36 states.

An estimated \$34 million was paid in 1965—\$4 million more than in the preceding year—to compensate 62,000 farmers whose crops did not return production costs. With the addition of sugar beets and tung nuts, policies were written on 23 types of crops. Some specialty crops, such as citrus fruits, raisins, cherries, and peaches, were insured only against such unusual hazards as freezing and wind damage.

Farm Credit System. An independent agency providing credit to farmers, ranchers, and cooperatives, the Farm Credit System had a record \$7.9 billion in loans outstanding at the end of the fiscal year 1965. This was \$932 million more than a year earlier and represented a 13.4% increase. The \$6.6 billion loaned during the year—also a record—was \$730 million more than in fiscal 1964. This 12.4% increase in new credit brought the loans outstanding total to an all-time high.

The Farm Credit System, supervised by the government and owned by farmers and cooperatives, is made up of 12 federal land banks and 735 affiliated federal land bank associations; 12 federal credit banks and 482 affiliated production credit associations; and 13 banks that provide credit to cooperatives. It raises loan funds by selling bonds and debentures on the open market.

Federal land bank associations under the Farm Credit System lent \$1.2 billion to 58,908 farmers on long-term mortgages. At the end of fiscal year 1965, the association had \$4.1 billion in 384,330 loans outstanding—\$600 million more than a year earlier. **Production credit associations** lent \$3.9 billion in short- and intermediate-term credit in fiscal year 1965, up 4.9% from the previous year. The banks for cooperatives made 2,488 loans totaling a record \$1.3 billion, up 20.3% from fiscal year 1964. The bank loans outstanding at the end of fiscal year 1965 totaled \$931 million, up 22.9% from a year earlier.

AIR FORCE

On Feb. 1, 1965, Gen. John P. McConnell succeeded Gen. Curtis E. LeMay as chief of staff of the U.S. Air Force. LeMay, who retired, was the last important World War II commander on active service. Gen. William H. Blanchard took over from McConnell as vice chief of staff.

Harold Brown, director of defense research and engineering, was sworn in as secretary of the Air Force on October 1. He succeeded Eugene M. Zuckert, who had been secretary since 1961. Zuckert and his undersecretary, Brockway McMillan, retired. Norman Paul, assistant secretary of defense for manpower, assumed the post that formerly had been held by McMillan.

Strategic Air Command (SAC). In 1965 the number of SAC missiles on alert exceeded for the first time the number of its manned bombers. There were over 850 ICBM's (Intercontinental Ballistic Missiles), about 600 B-52's, 80 B-58's, and a diminishing number of B-47's, which were being phased out of the inventory. The last of 800 Minuteman I ICBM's became operational on June 30, 1965. A month earlier, the Air Force had announced its plans for the eventual replacement of the Minuteman I with the larger, more powerful Minuteman II. When complete, the SAC Minuteman force will total 1,000 operational missiles. (See also **MISSILES**.)

Reconnaissance. The 4200th Strategic Reconnaissance Wing was activated in January 1965 at Beale Air Force Base, Calif.; it is to make preparations for receiving the SR-71, the world's most advanced strategic reconnaissance plane. The SR-71 will fly at more than three times the speed of sound and will operate at altitudes higher than 80,000 feet. In just one hour of flight it can cover an area of 60,000 square miles with its reconnaissance "eyes."

Tactical Air Command (TAC). After a massive four-year buildup, TAC had 15 wings in mid-1965, with more than 1,400 tactical fighters. This force, more than double its strength in 1961, includes a large number of F-4C Phantom II's, the newest member of the USAF jet inventory. TAC's assault airlift force also increased in size—from four to six wings, with two more programmed. There were more than 315 of the versatile C-130 Hercules in the inventory. Tactical reconnaissance was improved with the introduction of the RF-4C version of the Phantom II. The RF-4C is being equipped with advanced sensors, radar, and photographic equipment.

During the four-year period of expansion, TAC was equally busy improving combat capabilities, with particular emphasis on across-the-board support for the Army. The USAF Tactical Air Warfare Center is an outgrowth of this emphasis. Established in 1963, it was made a permanent facility in 1965.

Air Commando operations were expanded and underwent steady upgrading with the application of lessons learned in air operations in Vietnam. New methods of delivering supplies and rescuing personnel in dense jungles and in darkness were developed, and improved aircraft and armaments were tested and adapted. During the 1964-65 fiscal year, an accelerated training program produced more than 250 aircrews, comprising more than 600 personnel.

The 464th Troop Carrier Wing of TAC was awarded the MacKay Trophy for its part in rescuing some 1,500 refugees and hostages from Congolese rebels in November 1964. The mission was cited as a milestone in "precision employment of tactical airpower under unusually arduous conditions." Less

than six months later, TAC's assault airlift forces were again committed to an emergency, this time in the Dominican Republic. Together with the Military Air Transport Service (MATS) and Reserve units, the airlift forces transported some 20,000 passengers and over 18,000 tons of cargo.

Air Defense Command (ADC). Several developments increased the capability of this Air Force component of the U.S.-Canadian North American Air Defense Command (NORAD). On May 1, 1965, the YF-12A fighter-interceptor proved its high-speed cruise capability by setting seven world records, including speed over a straight course (2,062 mph.) and sustained flight at an altitude of 80,000 feet.

The existence of two antisatellite systems, operated by the Army and the Air Force, was revealed by President Johnson early in the 1964-65 fiscal year. The Air Force system, employing the Thor missile, is manned by ADC crews. The completion of these systems was termed a rare achievement, because the United States has in effect discouraged the development of an offensive weapon in space by perfecting an operational defensive capability in advance.

OTH (over-the-horizon) radar, also announced by the president, was called one of the most dramatic examples of new developments in national defense. OTH radar will detect missiles within seconds of launch at a distance of several thousand miles. While not replacing the Ballistic Missile Early

Warning System (BMEWS), the new radar system will almost double the present 15-minute warning time of an ICBM attack.

Military Air Transport Service. MATS airlift crews were busy with joint airlift tests and mobility exercises, and weather, rescue, photomapping, and geodetic missions in every part of the world during 1965.

MATS, which changed its name to Military Airlift Command (MAC) on Jan. 1, 1966, participated in 15 exercises during 1965. Each exercise was designed to establish, test, and refine joint air-support doctrine. For the most part, however, tests and exercises were pre-empted by airlift demands resulting from the acceleration of the war in Vietnam and from U.S. military intervention in the Dominican Republic revolution.

Larger, more productive aircraft—such as the C-141, now coming into the inventory, and the C-5A, now under active development—will further improve airlift capability. A measure of its efficiency is the fact that the C-141 does the work of at least four C-124's. The C-5A, in turn, will be five times as productive as the C-141, with only a minor increase in operating cost. Weighing approximately 362 tons and having payload capacity of 132 tons, the C-5A will be able to operate from relatively primitive airfields when necessary, thanks to advancement in landing-gear design.

In December 1964, the Air Weather Service

GEN. JOHN PAUL McCONNELL (left) succeeded Gen. Curtis E. LeMay as Air Force chief of staff in 1965. McConnell endorses Defense Secretary Robert McNamara's "cost effectiveness" program of applying managerial concepts of big businesses to the armed forces.

HAROLD BROWN (right), appointed secretary of the Air Force in 1965 to succeed Eugene Zuckert, was formerly director of defense research and engineering. As head of the Pentagon's huge research program, he played a vital part in new weapons development.

UPI

(AWS) of MATS received the first of 43 production models of a revolutionary new cloud radar, capable of determining the altitude and thickness of clouds up to 60,000 feet. As in previous years, AWS continued its upper-atmosphere sampling mission, in-depth meteorological support of the Air Force and other services, and support of NASA space activities.

The Air Rescue Service, another MATS subcommand, saved the lives of 125 persons and directly aided more than 1,300 others between mid-1964 and mid-1965. It joined the airlift force in providing many humanitarian missions in all parts of the world. Para-rescuemen of the Air Rescue Service also participated in space missions; they pulled the Gemini astronauts out of the water and deposited them safely aboard the Navy's carriers.

Air Force Systems Command. AFSC made notable contributions toward U.S. space programs. On June 18, 1965, the first Titan 3-C was successfully launched from Cape Kennedy to become the free world's mightiest space booster. The rocket has more than 2 million pounds of liftoff thrust.

Looking toward the future in space, AFSC is working on a fourfold spacecraft research program to develop unmanned test vehicles capable of maneuvering to a precision recovery site after reentering the earth's atmosphere. The START program (Spacecraft Technology and Advanced Reentry Tests) includes hypersonic flight tests of unmanned reentry vehicles. Five of six flight-test attempts in another program were completed on Feb. 23, 1965; they were called ASSET, for Aerothermodynamic/Elastic Structural Systems Environmental Tests. Study contracts for the Manned Orbiting Laboratory were placed with industry after the project was approved for development in August 1965.

The Air Force continued its close support of the National Aeronautics and Space Administration's projects. On March 23, 1965, a modified Air Force Titan 2 space booster launched the first two-man Gemini spacecraft (*Gemini 3*) into orbit. In the following months, other Titan 2 boosters successfully placed four more Geminis in orbit. The last two, *Gemini 6* and *Gemini 7*, rendezvoused in space on December 15. Tracking of NASA space launches and biomedical research conducted by the Air Force also provided essential elements of support for the national space program.

A scientific highlight of the year represented a significant step forward in the refinement of satellite geodesy technique. In January 1965, Air Force scientists bounced a laser beam off the orbiting Explorer 22 satellite and photographed the reflection.

This technique will enable scientists to determine with greater precision the distances between two or more widely separated points on the earth's surface. This first successful laser experiment in satellite geodesy is being further developed into an operational system. (See SPACE EXPLORATION.)

The National Magnet Laboratory, located at the Massachusetts Institute of Technology and supported by the Air Force Office of Scientific Research, utilized a giant water-cooled magnet to produce the strongest continuous magnetic field generated by man: 255,000 gauss, or more than 100,000 gauss higher than ever recorded before. In comparison, the earth's magnetic field is about one-half gauss in strength. The development of the magnet opens a new era of high magnetic field research in several areas of physical science, including the magnetic, optical, electronic, and nuclear properties of matter.

Several milestones were reached in the development of advanced aeronautical systems. These included the early flights of the XB-70A and the F-111 tactical fighters, and continuing experiments with the X-15. The XB-70A, which flew for the first time on Sept. 21, 1964, later set a record for the highest gross takeoff weight in aviation history—more than 250 tons. After the first F-111A flight on Dec. 21, 1964, demonstrations of swept-wing and supersonic flight were made early in 1965. The X-15, extensively modified to increase its speed capability to mach 8, was flown by Capt. Joe Engle to more than 53 miles into space on June 29.

AFSC is developing two aircraft, the XC-142A and the X-19A, as part of a cooperative tri-service program to produce a new family of experimental VTOL (vertical takeoff and landing) aircraft. The XC-142A is the first vertical short takeoff and landing aircraft to be flown, and also the largest. It made its first hover flight in December 1964 and its first conversion flight in January 1965.

Manpower and Budget. At the end of fiscal 1965, the Air Force had 131,578 officers and 690,117 airmen on active duty. Over 22,000 officers and about 167,000 airmen were serving overseas. There were approximately 76,000 men in the Air National Guard and 193,000 men in the Air Force Reserve.

The military budget passed by Congress in August 1964 gave the Air Force \$18.5 billion for fiscal 1965. In September 1964, Congress appropriated \$351 million to build Air Force installations.

ALABAMA

Civil rights controversies continued to trouble Alabamians in 1965. A march from Selma to Montgomery, by Negroes and whites who opposed barriers to the right to vote, was protected by the federal government. Among other developments, the Alabama Legislature grappled with reapportionment problems posed by the U.S. Supreme Court's "one man-one vote" rulings.

Voting Rights Drive. On January 18, Martin Luther King, Jr., under the auspices of the Southern Christian Leadership Conference, inaugurated a voter registration drive in Selma and Dallas County. After a series of sustained demonstrations, mass arrests, and minor violence, Federal District Judge Daniel H. Thomas, on February 4, ordered the Dallas County Board of Registrars to speed the registration of Negroes. On February 18, 50 state troopers broke up an assemblage of 400 Negroes and civil rights workers in Marion—an incident in which one Negro was killed.

After Congress passed a Voting Rights Act in August, federal registrars entered Alabama to sign up Negro voters in counties affected by the act. The act eliminated Alabama's literacy test as a prerequisite to voting.

ALABAMA · Information Highlights

Area: 51,609 square miles.

Population: 3,622,000 (1965 est.).

Chief Cities (1965 est.): Montgomery, the capital (148,000); Birmingham (345,000); Mobile (222,000); Huntsville (122,000); Tuscaloosa (71,000); Gadsden (56,000); Pritchard (49,000); Anniston (35,000).

Government: Chief Officers—governor, George C. Wallace (D); lt. gov., James Allen (D); secy. of state, Agnes Baggett (D); atty. gen., Richmond Flowers (D); treas., Mary Texas Hurt Garner; supt. of pub. instr., Austin Meadows; chief justice, J. Ed. Livingston. **Legislature** (convened May 4, 1965)—Senate, 35 members (0 Republicans, 35 Democrats); House of Representatives, 106 members (3 R, 102 D, others, 1).

Education: School enrollment (1964-65)—public elementary, 482,000 pupils (15,070 teachers); public secondary, 376,000 (13,800 teachers); nonpublic schools, 34,300 pupils (1,270 teachers); college and university (fall 1964), 56,182 students. **Public school expenditures** (1964-65)—\$226,000,000 (\$288 per pupil); average teacher's salary, \$4,775.

Public Finance (fiscal year 1964): Revenues, \$779,817,637 (4% sales tax, \$140,851,791; motor fuel tax, \$83,868,218; federal funds, \$181,321,841). **Expenditures**, \$776,276,082 (education, \$220,310,572; health, welfare, and safety, \$161,636,191; highways, \$155,055,300). **State debt**, \$301,659,000 (Sept. 30, 1964).

Personal Income (1964): \$5,959,000,000; average annual income per person, \$1,749.

Public Assistance (fiscal year 1965): \$113,714,502 to 149,535 cases (aged, \$91,378,157; dependent children, \$10,553,852).

Labor Force (employed persons, July 1965): Agricultural, 89,500; nonagricultural (wage and salary earners), 1,060,900 (26% manufacturing, 16% trade, 16% government). **Unemployed persons** (July 1965)—45,100.

Manufacturing (1963): Value added by manufacture, \$2,342,124,000 (transportation equipment, \$142,593,000; primary metals, \$509,274,000; nonelectrical machinery, \$35,546,000; electrical machinery, \$37,553,000; fabricated metals, \$133,728,000; food and products, \$201,265,000).

Agriculture (1964): Cash farm income, \$634,155,000 (live-stock, \$343,529,000; crops, \$263,125,000; govt. payments, \$27,501,000). **Chief crops** (tons)—corn, 1,320,000 (ranks 16th among the states); cottonseed, 361,000 (rank, 5th); peanuts, 129,200; (rank, 3rd); potatoes, 113,000 (rank, 19th); sweet potatoes, 23,100 (rank, 11th); peaches, 7,200 (rank, 20th); hay, 744,000.

Mining (1964): Production value, \$235,690,000 (rank, 20th). **Chief minerals** (tons)—Coal, 14,435,000 (ranks 8th among the states); iron ore, 2,359,000 (rank, 5th); lime 599,000 (rank, 8th); stone, 15,852,000; clays, 1,991,000; petroleum, 8,498,000 barrels.

Fisheries (1964): Commercial catch, 15,066,833 pounds (\$3,974,469). **Leading species**—shrimp, 7,214,738 pounds (\$2,629,814); red snapper, 2,392,875 pounds (\$685,133); blue crab, hard, 1,761,725 pounds (\$110,335); oysters, 1,005,260 pounds (\$324,125).

Transportation: Roads (1964), 66,557 miles (31,401 paved); motor vehicles (1964), 1,529,876; railroads (1964), 5,207 track miles; airports, 90 commercial and municipal.

Communications (1965): Telephones, 1,122,600; television stations, 13; radio stations, 152; newspapers, 20 (daily circulation, 1,828,446).

A CIVIL RIGHTS RALLY in front of the Alabama State Capitol in Montgomery on March 25 climaxed a march from Selma. The Rev. Martin Luther King addressed the crowd.

WIDE WORLD

GEORGE C. WALLACE, the governor of Alabama, encountered setbacks in 1965. He opposed the adoption of the federal Voting Rights Act, which promised to add Negroes to the rolls. He attempted to prevent a civil rights march from Selma to Montgomery, but the federal government intervened. Meanwhile, integration of the Alabama public schools proceeded steadily. He sought to amend the Alabama Constitution, which forbids a governor to seek reelection. The House passed the proposed amendment, but it failed in the Senate.

Wallace was born in Clio, Ala., on Aug. 25, 1919. He graduated from the University of Alabama Law School in 1942, and flew missions over Japan during World War II. He served in the legislature after the war. As judge of the Third Judicial Circuit from 1953 to 1959, he defied the federal Civil Rights Commission. He was elected governor in 1962. In 1963 he attempted but failed to prevent racial integration at the University of Alabama.

Selma-to-Montgomery March. On March 7 a major confrontation took place at Selma between Negroes, headed by King, and state troopers and sheriff's deputies. A scheduled march to Montgomery by 500 Negroes was broken up in a violent melee. On March 9 the Reverend James J. Reeb, a white Unitarian minister from Boston, was struck by a club as he left a Negro café. He died two days later. (On December 10, three Selma men were acquitted of his murder.)

The federal government sought an injunction barring interference with peaceful demonstrations, and hearings were held before Federal District Judge Frank M. Johnson in Montgomery. A conference between President Lyndon Johnson and Governor George Wallace on March 13, requested by the governor, failed to bring an agreement on the scheduled march. On March 17, Judge Johnson held that the Negroes had a constitutional right to march in order to petition the governor with regard to voting rights. Then, in a televised address to the Alabama Legislature, Governor Wallace sought to dramatize the need for the federal government to assume responsibility for the safety and welfare of the marchers.

On March 20 the president federalized the Alabama National Guard and authorized the use of regular Army troops to provide protection and to maintain the public safety. The five-day march from Selma to Montgomery (March 21-25) culminated in a rally at the edge of the Capitol grounds.

On March 25, the last day of the march, another civil rights-connected killing took place. Mrs. Viola Gregg Liuzzo, the wife of a Detroit Teamsters Union official, was shot as she drove along a highway in Lowndes County. The first trial of Collier Leroy Wilkins, who was charged with the murder of Mrs. Liuzzo, ended in a hung jury on May 7. On October 22, Wilkins' second trial resulted in his acquittal despite the dramatic prosecution by Attorney General Richmond Flowers. However, three members of the Ku Klux Klan, including Wilkins, were convicted in federal court on December 9 on charges of conspiring to deprive Mrs. Liuzzo of her civil rights. On September 30, Thomas L. Coleman, a deputy sheriff of Lowndes County, was acquitted by a jury for the August 20 slaying of Jonathan M. Daniels, a seminary student. (See also CIVIL RIGHTS.)

Legislative Developments. In February the legislature was called into special session by the governor to consider educational matters. A tax-supported, free textbook program for students in the first eight grades of the public schools was enacted. A record educational appropriation of \$459 million for the next biennium was approved. On March 4 the legislature convened in regular session, faced with federal court orders to correct the existing pattern

of congressional districts and state legislative apportionment. After a bitter fight the legislature realigned the congressional districts, in the process dividing Jefferson County (Birmingham) into three districts. The legislators also passed a water pollution measure, created a new department of mental health, increased pay for state employees, appropriated \$5 million for junior colleges and trade schools, and approved a \$25 million highway bond issue.

In September, Governor Wallace called a special session to reapportion the legislature. He declared: "We feel it far better for this to be done by the legislature than by the courts." The legislature passed a measure that increased the seats for urban areas in both the House and the Senate. But the formula for apportionment of the House proved unacceptable to a three-judge federal panel, and on October 3 this panel modified the apportionment.

ROBERT J. FRYE
Associate Professor of Political Science
University of Alabama

ALASKA

The resurgence of Alaska in 1965, after the devastating earthquake of March 1964, has surprised even the Alaskans.

Recovery from Earthquake Damage. President Johnson reported to Congress in August 1965 that the federal government had provided Alaska with more than \$336 million in grants and loans, averaging \$1,360 for each citizen. He said that Alaska had substantially recovered from the effects of the quake, and that "the destiny of our 49th state is again bright with promise." He reported that \$163 million had been given in the form of direct grants, and \$97 million in loans to individuals, business firms, and other organizations. The remainder of the funds went to repair damaged federal facilities. He noted that the fishing industry had increased its catch by 100 million pounds, valued at \$1,600,000. The per capita annual income in Alaska had risen from \$2,850 at the time of the disaster to \$3,154 in 1965—an increase of 11%.

Although highway damage amounted to an estimated \$75 million, and 27.4% of the bridges on the primary and secondary roads had to be replaced, highway repairs were virtually completed in 1965. Airports have been restored, the Alaska Railroad returned to full schedule with new equipment, most schools were repaired or rebuilt, and docks and harbors were either expanded or being repaired.

Anchorage ranked first among the cities in terms of expenditures for reconstruction—\$27 million. Seward was second, with \$20 million, and Valdez third. The entire village of Valdez was moved a few miles to a safer location. Numerous other com-

STEVE MCCUTCHEON, GAMMA PICTURE AGENCY

ALASKA'S RECOVERY from the earthquake of March 27, 1964, has been rapid. Fourth Avenue in the business district of Anchorage, reduced to ruins by the earthquake (above), has been almost completely rebuilt (right). The First National Bank Office Building appears at the left.

munities also required a great deal of rehabilitation.

Legislation. In the first session of the 1964-65 legislature, which met from Jan. 25, 1965, to April 9, 1965, Democrats held 17 of the 20 seats in the Senate and 30 of the 40 seats in the House of Representatives.

The legislature appropriated \$161 million for the 1966 fiscal year. State employees' wages were increased 7%. Other bills created a Commission on Human Rights, provided for the training of mentally retarded and physically handicapped children, and removed the cause of disputes between borough boards and local school boards.

Governor William Egan issued a proclamation in September redistricting the state Senate in accordance with federal court interpretations. Although Anchorage gained four seats and Fairbanks one, southeastern Alaska, where these cities are located, lost most in the redistricting.

Fisheries. Alaskan fishermen had a good year in 1965, although the run of pink salmon in southeastern Alaska fell below expectation. In the Bristol Bay area the pack was 1,449,346 cases of "48 one-pound talls." The total catch of 24 million red salmon almost equaled the record catch of 1938. The halibut catch was expected to exceed 60 million pounds, and the price for halibut was the highest on record.

Petroleum. The production of petroleum and natural gas is the most recent stimulus to the Alaskan economy. Five oilfields are to begin producing in 1966. One well in Cook Inlet has a daily production of 2,500 barrels. Petroleum receipts from state bonus bids, state rentals and royalties, and federal rentals and royalties increased \$2 million in the fiscal year, to a total of almost \$16 million.

Forest Products. Alaska's tremendous forest resources are being more heavily developed. Timber-product exports increased 5.4% in the first five months of 1965 over the same period in 1964. In December 1965 the U.S. Forest Service arranged for a huge 50-year sale of pulp lumber from the North Tongass National Forest. It is estimated that

nearly 9 billion board feet will be sold. A new pulp plant costing more than \$50 million is to be installed by July 1971.

Tourism. The number of tourists visiting Alaska continued to increase in 1965. The three ferries

Public Finance (fiscal year 1965): Revenues, \$150,986,519 (federal funds, \$92,863,110; motor fuel tax, \$6,003,785). Expenditures, \$152,660,588 (highways, \$72,309,951; education, \$35,845,017; health, welfare, and safety, \$15,226,446). **State debt**, \$36,737,000 (June 30, 1965).
Personal Income (1964): \$779,000,000; average annual income per person, \$3,116.
Public Assistance (fiscal year 1964): \$6,109,000 (aged, \$1,146,000; dependent children, \$1,847,000).
Labor Force (employed persons, 1964): Agricultural, 731; non-agricultural (wage and salary earners), 65,400 (7% manufacturing, 14% trade, 46% government). Unemployed persons, 7,898 (March 1965).
Manufacturing (1963): Value added by manufacture, \$89,311,000 (lumber and wood, \$9,592,000; food and products, \$43,194,000).
Mining (1964): Production value, \$65,947,000 (ranks 38th among the states). Chief minerals (tons)—gold, 58,416 tr. oz. (rank, 7th); sand and gravel, 26,089,000; coal, 745,000; peat, 2,350; petroleum, 11,059,000 barrels.
Fisheries (1964): Commercial catch, 490,746,000 pounds (\$57,293,000). Leading species (1963)—pink salmon, 125,117,000 pounds (\$14,472,000); king crab, 78,740,000 pounds (\$7,607,000); chum or keta salmon, 35,748,000 pounds (\$3,046,000); red or sockeye salmon, 35,456,000 pounds (\$7,644,000).
Transportation: Roads (1963), 6,230 miles (2,825 paved); motor vehicles (1964), 100,113; Alaskan railroads (1965), 995 track miles; civil aircraft (1964), 2,725 (549 airports).
Communications: Telephones (1965), 59,000; television stations (1964), 5; radio stations (1964), 16; newspapers (1965), 7 (1964 daily circulation, 61,941).

that provide daily service to southeastern Alaska reported traffic increases between fiscal years 1964-65 and 1965-66 of 12.8% in the number of passengers and 17.2% in the number of vehicles. Visitors to the Mendenhall Glacier Visitors Center, near Juneau, exceeded 43,000, or 18,000 more than in the preceding season.

Construction. Big new motels and improved docks and canneries are numerous in Alaska. In Anchorage the 150-room, 8-story luxury hotel, the Captain Cook, and the 400-room, 15-story Anchorage Westward Hotel have been completed, and J.C. Penney's, the city's largest department store, has been completely rebuilt. A new lumber mill at Haines, with an annual capacity of 25 million board feet, replaced the mill that the earthquake destroyed at Whittier. A chip and cant mill with a capacity of 40 million board feet was placed in operation at Wrangell.

Centenary. The Centennial Commission initiated plans for the 100th anniversary of the purchase of "Alaska, the Great Land" from Russia in 1867. Commemorative buildings, exhibits, and museums are included among the scheduled highlights.

I.J. MONTGOMERY

Former Director, Alaska Merit System

ALBANIA

Albania, the smallest and least known of the East European Communist states, has been the only one that has consistently backed Communist China in its ideological struggle with the Soviet Union.

Foreign Policy. Albania continued to denounce both the Soviet Union and the United States in 1965. In January, an editorial in *Zeri i Popullit* (*The Voice of the People*), the country's Communist party newspaper, branded the successors of Soviet Premier Nikita Khrushchev as "revisionists" who harmed the international Communist movement by following his interpretations of Marxist-Leninist teachings.

Albania refused to attend a January meeting of the East European countries that adhere to the Warsaw Pact. Albania then released the text of a letter, sent to the other members of the Warsaw Pact, that accused the Soviet Union of trying to weaken Albania militarily and economically. In March, Albania shunned a conference in Moscow

attended by Communists from 19 countries. At an international teachers conference in Algiers in April, and at a world peace congress in Helsinki in July, Albanian delegates joined Chinese Communists in criticizing the Soviet Union. Albania's close relations with Communist China were underscored by Premier Chou En-lai's visit to Tiranë in March.

Albania followed the lead of Communist China in denouncing American policy in Vietnam. In July, Ramiz Alia, a secretary of the Albanian Labor (Communist) party, warned that the Communists might impose a blockade to force the United States to withdraw from Vietnam; and in August the official Albanian news agency deplored President Johnson's decision to dispatch more U.S. troops to Vietnam.

Albania also displayed its ill will toward the United States and the Soviet Union at the United Nations. In February, the Albanian delegate to the General Assembly, Halim Budo, plunged the United Nations into turmoil by proposing that the Assembly resume normal procedure in voting. The Assembly had been seeking to forestall a confrontation between the Soviet Union and the United States, which had contended that countries more than two years in arrears on their United Nations assessments should not be permitted to cast votes. The United States indicated that it would not raise the arrears question during a procedural vote on Budo's proposal. The Assembly upheld, by a 97-2 vote, a ruling by its president that the Albanian motion was out of order.

In September, Budo accused the United States of trying to hinder the work of the General Assembly and of attempting to dominate the Congo (Léopoldville), Vietnam, and the Dominican Republic. U.S. Ambassador Arthur J. Goldberg denied these allegations.

Domestic Developments. Internally, the country is controlled by the Albanian Labor party and its first secretary, Gen. Enver Hoxha, who has been the most important political figure since 1946. The third five-year plan, begun in 1961 with the objective of increasing the country's industrial production, continued with the aid of Chinese advisers. There were indications that the Albanian consumer was beginning to demand goods of higher quality and greater variety. In response, a trend toward decentralization of industry and artisan cooperatives

ALBANIA · Information Highlights

Area: 11,097 square miles.

Population: 1,814,000 (mid-1964 est.).

Chief Cities: Tiranë, the capital, 140,300 (1961 est.); Shkodra, 43,305 (1960 census); Vlora, 41,423 (1960); Durrai, 39,937 (1960).

Government: Chairman of the Presidium—Haxhi Lleshi; Premier—Maj. Gen. Mehmet Shehu; Communist Party First Secretary—Enver Hoxha; Parliament—National Assembly (214 members, all of the Albanian Labor Party).

Religious Faiths: Muslims, 65% of population; Orthodox Christians, 25%; Roman Catholics, 10%.

Education: Literacy rate (1955)—71.5% of population aged 9 and over. Total school enrollment (1962-63)—327,894 (primary, 291,575; secondary, 11,170; teacher-training, 10,267; technical/vocational, 6,572; higher, 8,310).

Finance (1965 est.): Revenues, \$684,000,000; expenditures, \$672,000,000; monetary unit, lek (5 leks equal U.S.\$1).

Crops (metric tons): Cottonseed (1963), 15,000; wheat (1962), 146,000; maize (1962), 131,000.

Manufacturing (metric tons): Cement (1964), 140,000; gasoline (1962), 49,000; sugar (1964), 12,000.

Minerals (metric tons, 1964): nickel, 3,500 (ranks 6th among world producers); lignite, 300,000; chromite (1963), 281,000 (world rank, 6th); iron ore, 350,000; copper, 2,540; crude petroleum, 5,338,000 barrels.

Foreign Trade (1963): Exports, \$48,000,000 (chief exports, 1962: fuels, minerals, metals, \$25,760,000; foodstuffs, \$10,144,000; organic raw materials, \$2,740,000); imports, \$71,000,000 (chief imports, 1962: machinery and equipment, \$17,986,000; fuels, minerals, metals, \$14,400,000; raw materials for food industry, \$8,654,000); chief trading partners (1962): Communist China (took 29% of exports, supplied 65% of imports); Czechoslovakia (took 25% of exports, supplied 13% of imports); Poland (took 12% of exports, supplied 5% of imports).

Transportation: motor vehicles (1963), 7,100 (automobiles, 2,200); railways (1963), 65 miles; merchant vessels (1964), 8 (33,000 gross registered tons).

Communications: Telephones (1964), 6,000; television stations (1964), 1; television sets (1964), 1,000; radios (1964), 69,000; newspapers (1963), 2 (daily circulation, 87,000).

was evident. In August, Albania instituted a new currency at the rate of one new lek to 10 old leks. New coins and bills were issued, and wages and prices were recomputed at a 10-to-1 ratio.

ALBERTA

Alberta, Canada's westernmost prairie province, showed a marked economic advance in 1965. Progress was particularly notable in the north.

Economy. Major oil discoveries at Rainbow Lake focused attention on Alberta's hitherto neglected northwest corner. In the northeast, work proceeded on a \$210,000,000 project to extract oil from the tar sands and on a highway and a pipeline to Edmonton. The provincial government let contracts for a 100-mile railway from Edmonton to the northeast to tap untouched natural resources. The opening of a 50-mile freeway completed a limited-access highway between Edmonton and Calgary.

Alberta's grain harvests, although damaged by wet fall weather, found ample export markets.

Government. In the November federal elections, the Conservative party increased its share of Alberta's 17 parliamentary seats to 15. However, Harry Hays, federal minister of agriculture and Alberta's only member of the cabinet, was defeated.

Indians. A march on Edmonton in January by 111 Slave Indians emphasized the housing, welfare, and other needs of Alberta's Indians and Métis.

ALBERTA • Information Highlights

Area: 255,285 square miles.

Population: 1,454,000 (Oct. 1, 1965 est.).

Chief Cities (1964 est.): Edmonton, the capital (311,804); Calgary (294,924); Lethbridge (36,722); Medicine Hat (25,271); Red Deer (24,446).

Government: Chief Officers—Lt. gov., J. Percy Page; premier and atty gen., Ernest C. Manning (Social Credit party); prov. secy., Ambrose Holowach (S.C.); prov. treas., A.O. Aalborg (S.C.); min. of educ., R.H. McKinnon (S.C.); chief justice, Sidney Bruce Smith. **Legislature—Legislative Assembly** (convened Feb. 18, 1965), 63 members (party seating: 60 Social Credit, 2 Liberal, 1 Coalition).

Education: School enrollment (1964-65 est.)—public elementary, 204,622; public secondary, 146,284; private elementary and secondary, 1963-64 est., 6,436; Indian (1963-64), 4,281; university, 13,000. **Public school expenditures** (1963)—\$153,835,000; average teacher's salary, \$5,681.

Public Finance (fiscal year 1965 est.): Revenues, \$320,600,000 (income tax, \$54,832,000; sales tax, \$42,000,000; federal funds, \$14,040,000). **Expenditures**, \$333,320,000 (education, \$106,220,000; health and welfare, \$100,320,000; transportation and communications, \$61,390,000).

Personal Income (1964): \$2,568,000,000; average annual income per person, \$1,793.

Public Assistance (fiscal year 1965 est.): \$33,470,000 (aged and blind, \$11,670,000; dependents and unemployed, \$15,390,000).

Labor Force (1961 census): Agricultural, 104,162; manufacturing 41,242.

Manufacturing (1962): Value added by manufacture, \$392,985,000 (transportation equipment, \$14,962,000; primary metals, \$14,448,000; nonelectrical machinery, \$5,646,000; electrical products, \$3,931,000; fabricated metals, \$38,216,000; food and products, \$105,820,000).

Agriculture (1964 est.): Cash farm income, \$600,524,000 (live-stock, \$291,836,000; crops, \$303,568,000; government payments, \$4,466,000). **Chief crops** (cash receipts)—wheat, \$165,120,000 (ranks 2nd among the Canadian provinces); barley, \$39,887,000 (rank, 1st); flaxseed, \$12,027,000 (rank, 3rd); potatoes, \$2,524,000 (rank, 6th).

Mining (1964 est.): Production value, \$747,348,396. **Chief minerals** (tons)—sand and gravel, 16,558,448 (ranks 3rd among the Canadian provinces); cement, 771,361 (rank, 3rd); coal, 2,875,635 (rank, 2nd); salt, 101,400 (rank, 3rd); crude petroleum, 175,230,500 barrels (rank, 1st); natural gas, 1,184,041,600 thousand cubic feet (rank, 1st).

Transportation: Roads (1962), 70,445 miles (53,532 surfaced); motor vehicles (1963), 560,490; railroads (1963), 5,683 miles; airlines (1963), 4 (39 airports).

Communications (1963): Telephones, 448,001; television stations, 8; radio stations, 24; newspapers, 7 (daily circulation, September 1964, 280,330).

Education. Educational growth was marked at all levels. Many new vocational schools were opened, and additions made to others built in recent years.

ALGERIA

The coup d'état of June 19 dominated events in Algeria in 1965. Following rumors that President Ahmed Ben Bella was plotting to remove Col. Houari Boumedienne, minister of defense and major spokesman for the Algerian National Liberation Army, Boumedienne and a group of officers arrested Ben Bella. A 26-member Council of the Revolution became the "supreme political body" and appointed Boumedienne as its president. Boumedienne later became premier of a 20-man cabinet. He undertook an "Algeria first" policy, steering a middle course between East and West—seeking aid from both camps and warning against interference from either.

The Coup. Many factors contributed to a growing disaffection among the officers who had enabled Ben Bella to take power in 1962. In 1964, Ben Bella had taken control of the Ministry of the Interior, the provincial governments, and the police, and had placed planning, finance, and communications under his personal supervision. There also were indications that he hoped to organize the 300,000 war veterans to counter the army's influence.

COL. HOUARI BOUMEDIENNE, 40-year-old leader of Algeria, seized power from President Ahmed Ben Bella in a military coup on June 19, 1965. A fervent Muslim and nationalist, Boumedienne served as army leader, vice president, and defense minister under Ben Bella. He organized the coup with maximum efficiency and minimum bloodshed, and became president of Algeria's revolutionary council on July 5. Five days later he named a new 20-member cabinet with himself as premier and defense minister.

Boumedienne was born Mohammed Boukharouba in Guelma, Algeria, in 1925. (The pseudonym Boumedienne was adopted during the Algerian war for independence from France in 1954-62.) He is said to have been converted to violent nationalism during the Muslim uprising of 1945. While attending Al-Azhar University in Cairo, Egypt, in the early 1950's, he met Ben Bella, who was planning the Algerian insurrection. He joined the National Liberation Army in 1955, and was considered Ben Bella's chief supporter.

ALGERIAN LEADER Boumedienne (left) confers with Communist Chinese Foreign Minister Chen Yi in September.

Area: 919,590 square miles.

Population: 12,300,000 (mid-1964 est.).

Chief Cities (1960 census): Algiers, the capital, 722,066; Oran, 350,087; Constantine, 169,071; Annaba, 135,150.

Government: President and Premier—Col. Houari Boumedienne (took power June–July 1965). Council of the Revolution, 26 members.

Religious Faiths: Muslims, 84% of population; Roman Catholics, 6%; others, 10%.

Education: Total school enrollment (1962)—922,870 (primary, 849,767; secondary, 49,118; teacher-training, 623; technical, 20,618; higher, 2,744).

Finance (1964): Revenues, \$504,000,000,000; expenditures,

\$533,000,000; monetary unit, dinar (4.937 dinars=U.S.\$1). Gross Domestic Product (1959): \$2,854,000,000.

National Income (1959): \$2,368,000,000; average annual income per person, \$220.

Economic Indexes: Industrial production (1961), 110 (1958=100); agricultural production (1964), 99 (1956–57=100); cost of living (1961), 119 (1958=100).

Manufacturing (metric tons, 1963): Wine, 1,258,000; cement (1964), 730,000; wheat flour, 484,000; natural gasoline, 241,000; olive oil (1964), 24,000; tobacco, 2,670.

Crops (metric tons): Citrus (1964), 405,000 (ranks 12th among world producers); grapes (1963), 1,622,000 (world rank, 8th); wheat (1963), 1,580,000; barley (1963), 950,000; oats (1962), 32,000; leaf tobacco (1964), 12,500.

Minerals (metric tons, 1963): Crude petroleum, 182,806,000 barrels (ranks 9th among world producers); diatomite (1964), 17,600 (world rank, 10th); zinc, 36,000 (world rank, 20th); natural gas, 14,715,000 cubic feet; gypsum (1964), 177,000; salt, 130,000.

Foreign Trade (1963): Exports, \$700,000,000 (chief exports: raw materials, agricultural products, crude petroleum, wine, citrus fruits, iron ore, fresh vegetables); imports, \$800,000,000 (chief imports: foodstuffs, machinery, transport equipment, textiles). Chief trading partners (1963): France (supplied 70% of imports); U.S. (supplied 6% of imports); Italy (supplied 2% of imports).

Transportation: Roads (1964), 25,690 miles; motor vehicles (1964), 283,000 (automobiles, 198,000); railways (1963), 2,440 miles; merchant vessels (1964), 1 (3,000 gross registered tons); principal airports—Algiers, Bône, Oran.

Communications: Telephones (1964): 159,479; television stations (1964), 6; television sets (1964), 100,000; radios (1963), 1,500,000; newspapers (1963), 7.

This consolidation of power alarmed the military. Ben Bella reportedly confided in Col. Tahar Zbiri that Boumedienne would also be removed, and the officers decided to remove the president instead. Ben Bella was placed in an unknown prison in the Sahara, and later was moved to a former psychiatric ward of an Algiers hospital. His great popularity among students provoked riots in Algiers, Oran, Bône, and Constantine, but the army quickly brought the situation under control.

A declaration by Boumedienne immediately after the coup made it clear that the military had considered removing Ben Bella for some time, and the ease of doing so indicated that it had been well planned. The declaration attacked Ben Bella's "personal power" and protested the steady decline of Algeria under his rule. There were also signs that the military resented the strong influence of Egyptian and Russian advisers on Ben Bella.

The New Regime. In addition to Boumedienne and Zbiri, the key figures in the coup were Abdelaziz Bouteflika, who became the new foreign minister, and Ahmed Kaid, a famous internal chief of revolutionary forces, once known as "Commandant Slimane," who became finance minister. In the 20-man cabinet announced on July 5, 1965, two prominent persons were held over from the Ben Bella government: Bachir Boumaza, as information minister, and Ali Mahsas, as agriculture minister.

The new cabinet had the full support of the well-organized 50,000-man army, the largest in Africa. Boumedienne declared that Algiers needed no help "from abroad on how to build socialism," and Foreign Minister Bouteflika warned diplomats against "interference in Algeria's internal affairs." The most important domestic issues were finding employment for revolutionary veterans, and persuading peasants to deliver their wheat to government warehouses in order to feed the people during the winter. A new system of price supports was announced, but few crops were delivered because of a lack of confidence in the government that goes back to the attainment of independence.

Foreign Affairs. By far the most important international development in Algeria in 1965 was the postponement of an Afro-Asian summit conference to be held near Algiers. Originally scheduled for June

29, the conference was first moved back until November 5, and then postponed indefinitely. The Ben Bella government had reportedly spent \$12 million to refurbish the Club des Pins, once a French officers club, for the meeting.

Plans for the conference were confused even before the coup d'état because of feuds between Communist China and the Soviet Union, India and Pakistan, and Indonesia and Malaysia. The Boumedienne government officially favored holding the summit conference, but left the decision to the assembled foreign ministers, who announced the indefinite postponement on November 2. (See AFRICA.)

Economy. A major factor in the coup was the steady deterioration of the Algerian economy since independence. None of the factories promised by Ben Bella had been completed, and only 24% of the industrial credits appropriated for 1964 were used. Taxes were seldom collected, and inflation mounted as both French residents and Algerians placed their capital in European banks. Without oil revenues of about \$80 million a year and annual French aid of \$300 million, the Algerian government would have been bankrupt.

The French, determined to preserve good relations with Algeria, continued talks with officials of the new Algerian government on revising the oil and gas accord of 1962, and a new agreement was signed on June 29, 1965. Algeria was permitted to purchase all firms exploiting the huge gas reserves of the Sahara, and to buy a larger share of the French oil companies operating in the Sahara. The accord also gave Algeria assurance of an additional \$400 million in French aid over a five-year period, and scheduled tax increases on French firms that would increase oil revenues to \$240 million a year. Though regarded as highly favorable to Algeria, the accord forestalled the absolute nationalization of French firms, as promised by Ben Bella.

The United States recognized the Boumedienne government on July 6 and continued its assistance of about \$25 million a year. The Soviet Union promised \$227 million in aid, and Communist China, \$50 million.

Affairs, Cornell University

ALLERGIES

The progress of research laboratory work and the practical application of its results led to significant advances in the field of allergy in 1965. Facilities for training medical students and physicians in this specialty were improved.

Approximately 20 million Americans are hypersensitive to at least one of hundreds of normally harmless substances. The Allergy Foundation of America estimated in 1965 that 25 million man-days of work are lost each year because of allergies.

Research. The role of the thymus in immunity, tolerance, and hypersensitivity is a prominent research project promising to yield important new information. Successful efforts to fractionate gamma globulin have been made. This leads to better knowledge of the nature of antibodies and the mechanism of the antigen-antibody reaction. Continued efforts are being made to discover the relationships and differences between the immediate and delayed types of allergic reactions.

Autosensitivity, autoantibodies, and the so-called autoimmune antibodies have been studied intensively. It was recognized previously that these three factors can play an important role in adverse reactions to transfusions, pregnancies, and skin graftings. It now is apparent that they also are important subjects for study in order to find ways to transfer organs successfully from person to person (homotransplantation).

The body normally has methods of defense to repel any foreign invader, but sometimes the body responses are inappropriate (rejection of a transplanted organ) or are misguided and self-destructive (autoimmune disease).

Other subjects of investigation included the role of lymphocytes and the lymphatic system in the interaction between antigens and antibodies, and the role of hypersensitivity in infectious diseases. Findings from the studies on hypersensitivity may help specialists who are seeking ways to control flare-ups of allergy after colds, sinus attacks, and bronchitis.

Treatment. Fatal body reactions to penicillin injections and to a single sting of an insect are being studied, and measures for their control are being worked out. A study committee of the American Academy of Allergy, collecting data from every part of the United States, records more than 3,000 cases of sensitivity to insect sting. Immunization against severe reactions to insect stings has been very effective, and persons can obtain protection by this treatment.

Training and Information. Specialists are taking intensive courses on allergy so that they can provide more help for patients. The training program is directed by the postgraduate committee of the American Academy of Allergy and the American College of Allergists.

The Allergy Foundation of America supports postdoctoral research fellowships in the fields of immunology, microbiology, and allergy. It also prepares and distributes pamphlets on all aspects of allergy, including the environmental conditions that are favorable to allergic individuals, and answers inquiries on the subject.

ALLIANCE FOR PROGRESS. See LATIN AMERICA.

ALUMINUM

Sparked by product innovation and economic growth, the North American aluminum industry was expected to set new production and shipment records in 1965 for the fourth year in a row.

Production. The output of primary aluminum in 1964 totaled a record 2,552,747 tons in the United States, 835,000 tons in Canada, and 16,500 tons in Mexico. North America's record output accounted for nearly half the estimated world aluminum production of 6,718,000 tons. Production in 1965 was expected to total about 2,750,000 tons in the United States, 825,000 tons in Canada, and 20,000 tons in Mexico.

Industry Expansion. The primary aluminum capacity in North America was expanded to an estimated 3,687,000 tons in 1965, an increase of about 230,400 tons, or nearly 7%, above the 1964 capacity. Approximately 135,000 tons of this increase represented additional potlines, with the balance achieved through the modernization of existing installations. The Aluminum Company of America completed the second of two new 35,000-ton-capacity potlines at its War-ri-ck smelter near Evansville, Ind., thereby increasing its total rated capacity by nearly 127,000 tons. Consolidated Aluminum Corp. expanded its smelter at New Johnsonville, Tenn., by 32,000 tons.

Stockpile. The U.S. government and the Alcoa, Kaiser, Olin Mathieson, and Reynolds aluminum companies reached agreement on Nov. 23, 1965, for the sale of the excess government aluminum stockpile totaling nearly 1.4 million tons. The agreement calls for the sale of a minimum of 150,000 tons by the end of 1966, and of 100,000 to 200,000 tons annually thereafter. The exact sale quantity will be determined by defense needs.

Shipments and Markets. Net U.S. shipments of aluminum ingot and mill products (including primary, secondary, and imported metal) to consuming markets in 1964 totaled a record 3,590,000 tons. Shipments in 1965 were expected to increase by 10% or more.

Both the building and transportation industries used record amounts of aluminum in 1965 and were the two largest U.S. markets. Use of aluminum in automobiles averaged 70 pounds in the 1965 models.

The fastest-growing aluminum market continued to be the container and packaging industries. The use of aluminum in containers—especially as cans, easy-open can ends, and tear-off closures—made substantial gains in the packaging of beer, soft drinks, frozen juices, meats, baby food, and similar products. Aluminum shipments to this market increased from 50 million pounds in 1960 to more than 570 million pounds in 1964.

Exports. In 1964 the leading exporters of primary aluminum in the free world continued to be Canada (627,992 tons), Norway (291,894), the United States (208,622), France (131,970), Cameroon (50,544), and Austria (37,326). The largest free world exporters of semifabricated products in 1964 were: Belgium-Luxembourg (94,959 tons), the United States (82,444), West Germany (67,314), Britain (52,720), France (48,664), and Canada (28,838). AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS. See **LABOR**.

AMERICAN LIBRARY ASSOCIATION

Both President Johnson and the Congress focused attention in 1965 on the library needs of the United States. Significant legislation supported by the American Library Association (ALA) and passed by Congress included the Elementary and Secondary Education Act of 1965, which authorized \$100 million for library books and facilities, and the Higher Education Act of 1965, which provided for college library resources and for library training and research. In addition, Congress approved a new Library Services and Construction Act appropriation of \$55 million. (See **EDUCATION**.)

Annual Conference. The 84th annual conference of the ALA was held in Detroit in July 1965. At the meeting, the association accepted \$75,000 (to be matched by ALA funds) from the H.W. Wilson Foundation, Inc., to establish an office for the recruitment, education, and employment of librarians.

New officers were installed at the conference. The president is Robert Vosper, librarian, University of California at Los Angeles; first vice-president and president-elect, Mary V. Gaver, professor, Graduate School of Library Service, Rutgers University; second vice-president, Rutherford D. Rogers, librarian, Stanford University; treasurer, Ralph Blasingame, Jr., associate professor, Graduate School of Library Service, Rutgers.

Other Meetings. Four ALA-sponsored conferences in 1965 reflected major library concerns and activities. At a meeting in Warrenton, Va., representatives of 54 national organizations discussed urgent library needs in relation to educational developments. At the Intellectual Freedom Conference, held in Washington, D.C., delegates developed a program of action for librarians threatened with abridgment of the principles set forth in the Library Bill of Rights. Librarians attending the Legislative Workshop in Washington, D.C., studied the legislative process at local, state, and national levels. At a meeting in Detroit devoted to the theme, "National Inventory of Library Needs—1965," it was learned that many libraries are below ALA standards regarding the number of volumes, the size of staff, and the amount of operating expenditures. Studies revealed that \$3.7 billion is needed to meet basic standards.

Activities. As part of the J. Morris Jones-World Book Encyclopedia-ALA Goals Award, the Public Library Association received \$17,855 in order to publish a new edition of *Public Library Service*.

Library Technology Reports, a bimonthly publication launched in January 1965, offers information on library equipment, supplies, and systems. A film entitled . . . *And Something More*, produced by the ALA Knapp School Libraries Project, won a Golden Eagle award of the Council on Nontheatrical Events, Inc. The film was also a winner at the American Film Festival, sponsored by the Education Film Library Association.

For the second year of the New York World's Fair, the ALA, together with the American Documentation Institute and the Special Libraries Association, continued to sponsor a library exhibit at the United States Pavilion. In addition to an information center, the exhibit comprised a collection of books selected for the White House library, taped book reviews, and a children's reading area and theater.

Awards. Bertha Margaret Frick, former associate professor of the Columbia University School of Library Service, received the 1964 Melvil Dewey Medal for creative professional achievement. Mrs. Frances Clarke Sayers, former lecturer at the UCLA School of Library Service, won the 1965 Joseph W. Lippincott Award of \$1,000 for distinguished service.

The Beta Phi Mu Award for service in education for librarianship went to Jesse H. Shera, dean of the School of Library Science, Western Reserve University. The Grolier Award of \$1,000 for outstanding contributions to young people's reading went to Sarah Lewis Jones, chief library consultant of the Georgia State Department of Education.

Roberta Bowler, retired assistant librarian of the Los Angeles Public Library, won the Scarecrow Press Award for Library Literature. The *PLNA Quarterly*, edited by Eli M. Oboler, received the H.W. Wilson Library Periodical Award.

Maia Wojciechowska won the Newbery Medal for *Shadow of a Bull*. The Caldecott Medal went to Beni Montresor for *May I Bring a Friend?* Sterling North's *Rascal* won the 1963 Aurianne Award.

Katharine G. Harris, of the Detroit Public Library, received the Isadore Gilbert Mudge Citation, and Laura C. Colvin, of Simmons College, was honored with the Margaret Mann Citation. Perrie Jones, former librarian of the St. Paul (Minn.) Public Library, won the Association of Hospital and Institution Libraries Exceptional Service Award. The first person to earn the new Armed Forces Librarians Section Achievement Citation was Helen E. Fry, U.S. Army staff librarian, Fort Sam Houston. (See also **PRIZES AND AWARDS**.)

Special Grants. For study in children's librarianship, the Library Binding Institute awarded a scholarship of \$1,000 to Barbara Ellen Wunder, Ohio State University Library. A \$1,500 scholarship was granted to Mrs. Mary Ann Stevenson of Ann Arbor, Mich., by the Frederic G. Melcher Scholarship Fund. Mrs. Joan Allene Parmeter Nolan, Ambler (Pa.) Public Schools, received the \$1,000 E.P. Dutton-John Macrae Award for advanced library work.

The ninth annual Grolier-Americana scholarships of \$1,000 each went to the graduate library program at Western Michigan University and to the undergraduate program at Illinois State University. (See also **LIBRARIES**.)

EDWARD G. STRABLE
Executive Secretary, Reference Services Division
American Library Association

AMERICAN LITERATURE

The year 1965 was disappointing from a literary point of view. In fiction and in poetry, while some worthwhile books were published, there were few manifestations of exciting new talent and few books which added substantially to the reputations of established writers. However, a justifiable stir greeted the appearance, late in the year, of a long work by a new novelist, Marguerite Young. Her book, *Miss MacIntosh, My Darling*, was probably the most important creative work of an undistinguished year. Perhaps the closest thing to a literary controversy was the divergent criticism in reviews of Norman Mailer's *An American Dream*, but this discussion died down quickly, and the book made its way to the best-seller lists.

The situation was somewhat better in the fields of history and literary criticism. But even there, most public attention centered on the sensational aspects of topical books like those about the Kennedy administration by former presidential aides Theodore Sorensen and Arthur M. Schlesinger, Jr., rather than on the more substantial works of such historians as Samuel Eliot Morison, Bruce Catton, and Daniel Boorstin.

Saul Bellow and Shirley Ann Grau won the major 1965 literary prizes for American fiction. Bellow received the National Book Award and also the International Prize for Literature for his 1964 novel *Herzog*; Miss Grau was awarded the Pulitzer Prize for fiction for her novel *The Keepers of the House*, also published in 1964. John Berryman won the 1965 Pulitzer poetry award for *77 Dream Songs* (1964). (See PRIZES AND AWARDS.)

Novels. Marguerite Young's book was the product of 17 years' labor, and it is a large and impressive work, deserving of the comparisons reviewers made to Joyce, Faulkner, and Melville. Centered around four characters who are human even though sometimes grotesque, *Miss MacIntosh, My Darling* moves without awkwardness between fantasy and reality, exploring the paradoxes and complexities of contemporary American life. In the words of William Goyen, who reviewed the book for the *New York Times* on September 12, the author "has found, surely, instinctively and in her own time, her grand

metaphor; and it glistens and radiates and exists in this colossal shape as hard and as concrete as the truth itself. It is a masterwork."

Norman Mailer's fourth novel, *An American Dream*, was a real disappointment. In spite of the author's unquestioned skill as a writer, the new book is ridden by clichés of the "tough" school of modern fiction, and it relies far too heavily on melodramatic effects and explicit delineation of sexual episodes. In view of Mailer's great talent and his oft-stated desire to be one of the giants of American fiction, *An American Dream* is a disastrous revelation of the author's weaknesses.

John Updike's short novel *Of the Farm* was his best novel since *Rabbit, Run* (1960). More pointed and less discursive than his earlier fiction, *Of the Farm* centers on the encounter of a 35-year-old man, his wife and her son, and the man's mother. The characters are strongly established, and the action is believable.

Two of the most interesting novels of the year were late entries by writers who have made critical reputations in the past, but who have not yet established contact with a wide public. Peter Matthiessen, in *At Play in the Fields of The Lord*, made use of his professional knowledge of anthropology to tell the story of a primitive South American tribe which an American Indian tries to help resist the encroachments of civilization; the attempt fails, but it provides the plot for an unusual and provocative novel. George P. Elliott's *In the World* is the study of a group of people who have to come to terms with the lives that they have made for themselves; Elliott succeeds in showing the dangers of retreating into fantasy, whether it is grim or appealing.

Another novel of considerable interest was William Humphreys' *The Ordways*, the tale of an Odyssean search through old Texas by a father looking for a lost son. Skillfully written, sometimes humorous and sometimes pathetic, *The Ordways* is to some degree flawed by the author's overly obvious indebtedness to such masters as Faulkner and Katherine Anne Porter; even so, the book is a considerable accomplishment.

The prolific Wright Morris produced *One Day*, a study of the lives of ordinary people in a small California town on the day of President Kennedy's assassination. Although affecting and occasionally funny, the book was one of Morris' less successful attempts to find significance in the lives of common people. Irwin Shaw's *Voices of a Summer Day* was an exercise in nostalgia: the story of a man looking back over a happy and relatively uneventful life. Herman Wouk's *Don't Stop the Carnival* was an uninspiring potboiler about a group of dull people at a Caribbean resort. Peter de Vries produced another of his half-serious, half-comic fictions in *Let Me Count the Ways*, a book too much like others he has written in the past.

Frederick Buechner's characters, in *The Final Beast*, move in a kind of shadowland between dream and reality. Although the novel has murky suggestions of mysticism, on one level it is a realistic study of a widowed minister trying to make a life for himself and his motherless children.

Among the younger writers, C.D.B. Bryan attracted some attention with *P.S. Wilkinson*, a story of a young Korean War veteran trying to find a means of living in modern American society. While serious and perceptive, the book is often superficial and pretentious. In *A Covenant with Death*,

MARGUERITE YOUNG hugs manuscript of her 1965 novel *Miss MacIntosh, My Darling*, which took 17 years to write.

STEPHEN W. FRISCH, BLACK STAR

DANIEL A. LINDELY

JOHN HOWARD

SAUL BELLOW, acclaimed by many critics as the foremost living American novelist, won his second National Book Award and the International Prize for Literature in 1965 for his novel *Herzog* (1964). As in his earlier novels *The Adventures of the Rain King* (1959), Bellow describes the attempt of the hero to accept himself and to survive in a confusing, often hostile world.

Born in Lachine, Quebec, on July 10, 1915, Bellow came from a Russian-Jewish immigrant family and was raised in Montreal and Chicago. He graduated from Northwestern University in 1937 with honors in anthropology. While doing graduate work, he realized he wanted to write. His first published novel was *Dangling Man* (1944). His third, *The Adventures of Augie March*, established his critical reputation and won the National Book Award in 1954. Bellow married Susan Glassman in 1961.

JOHN BERRYMAN, winner of the 1965 Pulitzer poetry prize, has been described by the poet and critic John Malcolm Brinnin as "a superb and difficult poet" of "absolute first rank" in the United States. Berryman's award-winning volume was *77 Dream Songs* (1964), whose hero "reacts with hopeless merriment" to the "brutality and stupidity that parades through his life and times." It is the writer's most important work since his long poem *Homage to Mistress Bradstreet* (1956).

Berryman was born in McAlester, Okla., on Oct. 25, 1914. He graduated from Columbia University in 1936 and has combined teaching at various universities with writing poetry, short stories, and criticism. His first poems appeared in magazines in the 1930's; his first volume of verse was *The Dispossessed* (1948). In 1950 he published a biography, *Stephen Crane*. Berryman married Eileen P. Mulligan in 1942.

SHIRLEY ANN GRAU won the 1965 Pulitzer fiction award for her third novel, *The Keeper of the House*, which was published in 1964. Like her previous works, it is set in her native South. It deals with racial problems, contrasting a fear-ridden society with the love of a white man and a Negro woman. Miss Grau's first book, a collection entitled *The Black Prince and Other Stories*, appeared in 1955 and was enthusiastically received by critics. However, her first two novels, *The Hard Blue Sky* (1958) and *The House on Coliseum Street* (1961), met with mixed critical reviews.

Miss Grau was born in New Orleans on July 8, 1929. She attended Booth School in Montgomery, Ala., and then went to Newcomb College of Tulane University, in New Orleans. She received her degree in 1950. The year that her first book was published, she was married to James Kern Feibleman.

Stephen Becker dealt more successfully with a more modest subject, the problem of a young judge faced with a serious and complicated legal question, whose answer is not to be found in any law book.

A husband and wife team, writing under the name K.B. Gilden, produced a best-seller, *Hurry Sundown*. It is a massive, two-volume examination of the fabric of contemporary life in the South, with special emphasis on racial relationships. Written in a rather plodding style, the book achieves its effects through the accumulation of an enormous amount of detail.

Relations between white men and Negroes concerned other novelists as well. Two important fictional treatments of the subject were published in 1965. Jesse Hill Ford's *The Liberation of Lord Byron Jones* describes characters who live in a small Southern town and are driven by forces they have set in motion but cannot control. John Hersey's *White Lotus* is an allegory set in some future time when white men have become the slaves of the yellow race, but Hersey's obvious subject is the history of the Negro's treatment in America. Earnest and concerned though the author obviously is, the novel is too crude and didactic to be successful fiction.

Other topical novels by young writers included *Up the Down Staircase* by Bel Kaufman. An account of life in a contemporary urban high school, it avoids sensationalism without trying to make an

ugly picture pretty. A very different subject, the lives of Americans in Special Forces units in Vietnam, attracted the attention of Robin Moore in *The Green Berets*. The book's revelations caused some controversy.

Short Fiction. The most important volume of short fiction published in 1965 was *The Collected Stories of Katherine Anne Porter*. It is made up almost entirely of stories and short novels published in earlier collections, but four stories are collected here for the first time. The book serves as a valuable reminder that Miss Porter, with her matchless style and her deep concern for such themes as betrayal and death, is probably the finest writer of short fiction. It is upon these stories, rather than her 1962 novel *Ship of Fools*, that Miss Porter's reputation is securely founded.

Another important volume collected works of a woman writer of an earlier generation. Mildred R. Bennett has edited *The Collected Short Fiction, 1892-1912* of Willa Cather. These stories, written before the novels which made her famous, show in embryo the themes and attitudes which were to inform Miss Cather's later work. The collection is especially valuable because it brings to public attention stories virtually unknown until now.

James Baldwin's *Going to Meet the Man*, a collection of stories written over a period of several years, shows the same power but also the same uneven quality that characterizes his longer fiction.

KATHERINE A. PORTER had her *Collected Stories* published in 1965. The volume brought together three prior collections and four other stories.

BIRNBACK PUBLISHING SERVICE

Other short-story volumes worthy of mention include Oliver LaFarge's *The Door in the Wall*, which is primarily concerned with the American Indians in whom LaFarge was so interested; John O'Hara's *The Horse Knows the Way*, stories in the well-worn manner of this veteran; Richard G. Stern's *Teeth, Dying, and Other Matters*, which shows that Stern is not yet as comfortable with the short story as with the novel; R.V. Cassill's *The Father and Other Stories*; and a mixed bag from Irwin Shaw, *Love on a Dark Street*.

Poetry. Despite the appearance of some promising new talents, the poetry published in 1965 was lacking in distinction. Typical was W.H. Auden's weakest volume in many years, *About the House*. While his humorous honesty lightens some of the poems, they are for the most part pedantic and overly concerned with trivial matters. Too serious to be successful light verse, the poems are too cranky to be taken seriously. Two more modest books of lighter verse were Roger Shattuck's *Half Tame* and Lincoln Kirstein's *Rhymes of a PFC*.

Other established poets who did little in 1965 to enhance their reputations include Jean Garrigue, whose *Country Without Maps* showed the absence of a firm grip on its materials. *The Narrative Poems of Mark Van Doren* demonstrate once again that the narrative form is not a comfortable one for modern poets, although Van Doren handles it as well as any contemporary. Randall Jarrell, who died in 1965 (see biographical sketch in *NECROLOGY*), published a collection called *The Lost World*, in which he showed that he had been unable to break away from the mannered style of his earlier work. Hayden Carruth was represented by *Nothing for Tigers: Poems 1959-1964*.

Several younger poets deserve special mention. Robert Duncan, in *Roots and Branches*, displayed an improving talent which may yet make him a major poet. David Ignatow, in *Figures of the Human*, made use of the language of ordinary speech, but demonstrated his ability to create striking effects. Donald Finkel displayed a vigorous style in *Simeon*, while Vern Rutsala turned a disappointing eye on American urban life in *The Window*. A.R. Ammons showed promise in two books of verse, *Tape for the Turn of the Year* and a collection of short but impressive poems, *Corson's Inlet*. James Dickey published *Buckdancer's Choice*, and Irving Feldman produced *Pripet Marshes and Other Poems*.

Literary History and Criticism. In the field of literary history, several important books dealt with

the American heritage. In *Mark Twain and the Gilded Age*, Bryan Morey French published an interesting study of an important phase in the development of one of the greatest American writers. An influential magazine was the subject of two books, Nicholas Joost's *Schofield Thayer and The Dial: An Illustrated History*, and William Wasserstrom's *The Time of The Dial*. Millicent Bell contributed valuable insights into a famous literary friendship in *Edith Wharton and Henry James: The Story of Their Friendship*. Miss Wharton was also one of several novelists discussed with sympathy and perception by novelist Louis Auchincloss in *Pioneers and Caretakers: A Study of Nine American Women Novelists*.

There were several interesting studies of important literary figures of the 20th century. One of the most valuable was Chad Powers Smith's *Where the Light Falls: A Portrait of Edwin Arlington Robinson*, a definitive study of the tragic life of a great, if neglected, poet. W.A. Swanberg tried, in *Dreiser*, to explain why the novelist moved through several literary and political worlds during his lifetime; the result unfortunately was somewhat superficial. Another naturalistic novelist was the subject of Richard O'Connor's *Jack London*. Malcolm Goldstein's *The Art of Thornton Wilder* is perhaps overly long, but it is the most thorough study of this dedicated artist. A famous group of writers, including John Crowe Ransom, Allen Tate, and Robert Penn Warren, was the subject of John L. Stewart's *The Burden of Time: The Fugitives and Agrarians*, a sympathetic study of the talented group which formed at Vanderbilt University during the late 1920's.

Among the interesting collections of literary criticism was Leo Marx's study of the influence of the industrial revolution on American literature, *The Machine in the Garden: Technology and the Pastoral Ideal in America*. Philip Rahv presented a number of his critical articles in *The Myth and the Powerhouse*; Frederick W. Dupee published *The King of the Cats and Other Remarks on Writers and Writing*; and Lionel Trilling was represented by *Beyond Culture*.

In the field of literary autobiography two books were outstanding, both centering on the turbulent depression decade before World War II. Alfred Kazin's *Starting Out in the Thirties* is an interesting account of one of the most distinguished American critical careers. The historian and critic Granville Hicks was the author of *Part of the Truth*, which discusses his life as a writer and teacher.

History and Biography. The flood of books about the Kennedy years continued unabated, with controversy centering around two books by close associates of the late president. Theodore Sorensen's *Kennedy* was generally acclaimed as the honest but tactful record of the author's association with John F. Kennedy, beginning when the latter was a freshman congressman and culminating in the presidency. Arthur M. Schlesinger, Jr., came in for much hostile comment because of his assertion, in *A Thousand Days*, that Kennedy had planned to drop Dean Rusk as secretary of state after the 1964 elections. There was widespread feeling that the revelation was harmful to Rusk's present position. Among other books dealing with the late president and his family, the most interesting was probably Richard J. Whalen's *The Founding Father: The Story of Joseph P. Kennedy*, an unflattering look at the patriarch of an amazing family.

A more wide-ranging and substantial work that also attracted a great deal of attention was Samuel Eliot Morison's *The Oxford History of the American People*, in which the veteran historian turned his attention from military chronicles to the broader subject of the American past. As Morison is both an excellent historian and an interesting writer, his book is the best one-volume study in its field.

An unusually large number of interesting studies dealt with more specific aspects of American history. A basic book in the study of the Revolutionary War was *The Peacemakers: The Great Powers and American Independence* by Richard B. Morris. It is a solidly documented account of the negotiations of Franklin, Adams, and Jay, leading to the Peace of Paris (1783). The frontier and the Old West received a good deal of attention. With *The Final Challenge: The American Frontier, 1804-1845*, Dale van Every concluded *The Frontier People of America*, a four-volume study of the years of colonization from 1754 until 1845. The latter part of the same period was the subject of Daniel Boorstin's *The Americans: The National Experience*, the second of a projected three-volume study of U.S. economic and political history.

The Lewis and Clark expedition (1803-06), which did so much to open the West to settlers, was the center of attention in George Dillon's *Meriwether Lewis: A Biography* and in Donald Jackson's edition of *The Letters of the Lewis and Clark Expedition*. Harry Sinclair Drago wrote about a later time in *Great American Cattle Trails*, and Philip Durham and Everett L. Jones told a forgotten story in *The Negro Cowboy*.

As the Civil War Centennial (1961-65) finally came to a close, Bruce Catton concluded his massive three-volume *Centennial History of the Civil War* with the publication of *Never Call Retreat*. The entire work is certainly one of the finest comprehensive studies of the subject, and the third volume is especially noteworthy because in it Catton seems less intoxicated by the glory and pomp of the war, and more deeply aware of its tragic aspects.

Other Civil War studies included *Lincoln's Scapegoat General: A Life of Benjamin F. Butler*, a sympathetic account of the life of the man known in the South as "Beast" Butler, by Richard S. West, Jr. Richard C. Wade contributed a chilling account of the life of slaves in urban centers, *Slavery in the Cities: The South, 1820-1860*. A further contribution to revisionist attempts to correct mistaken ideas about conditions after the war was Kenneth M. Stampp's *The Era of Reconstruction, 1865-1877*.

The early decades of the 20th century provided material for several very different books. Arthur S. Link published the 4th volume of his definitive study, *Wilson, Confusion and Crisis, 1915-1916*. The later judicial career of the man whom Wilson replaced in the White House drew the attention of Alpheus Thomas Mason in *William Howard Taft: Chief Justice*. The book emphasizes the irony of Taft's meddling in foreign and domestic affairs after his appointment to the Supreme Court, and shows that he was more willing to use executive power as chief justice than he had been as president. The history of the Industrial Workers of the World, a labor organization active in the United States in the first decades of the 20th century, is revealed in the unusual and striking *Rebel Voices: An I.W.W. Anthology*, edited by J.N. Kornbluh.

Among the books on aspects of World War II, Kenneth S. Davis' *The Experience of War: The United States in World War II* is a solid and comprehensive summary. In *Day of Trinity*, Lansing Lamont presents a documentary of the events of the day on which scientists exploded the first atomic device. Gar Alperovitz, in *Atomic Diplomacy*, is concerned with the decision to use the bomb against Japan, contending that the decision was made in order to gain an advantage over the Soviet Union in the postwar struggle for power. A different conclusion is reached in *The Decision to Drop the Bomb*, by Len Giovanitti and Fred Freed, who conclude that Japanese intransigence made the use of the bomb necessary and inevitable.

Dwight D. Eisenhower's account of his years in the White House, *Waging Peace*, as a disappointment to historians, who found in it little that was not already on the public record. The book is regrettably impersonal, and little of the warm but explosive Eisenhower personality is evident.

In the history of more recent events, Theodore H. White's popular study *The Making of the President, 1964* repeated his earlier performance in *The Making of the President, 1960*. The more recent of the two begins with the assassination of President Kennedy in November 1963 and follows the developing political conflict through the nomination of Barry Goldwater to his crushing defeat in the 1964 election.

Other Works. The problem of racial relations in the United States is at the heart of several books of reminiscences. Claude Brown's *Manchild in the Promised Land* is a hard and unsentimental picture of the difficulties of growing up in Harlem, and of the Negro's problem of establishing an identity in American society. Erskine Caldwell's *In Search of Bisco* is the story of a journey taken by the noted novelist through the South in search of a Negro he had known in his youth; it is a sad and depressing book. Another Southerner's unhappy view of his heritage is found in Robert Canzoneri's *I Do So Politely*.

Edwin Way Teale was one of the first of the recent naturalists to write about the natural world in a distinctive literary style. In 1965 Teale published *Wandering Through Winter*, an informative and graceful account of a winter journey across the United States. It is the final volume in a series dealing with the four seasons.

Two creative artists produced unusual books. The poetess Muriel Rukeyser wrote *The Orgy*, a vigorous and stimulating account of a festival in a small Irish town. Nelson Algren, the novelist, in *Notes from a Sea Diary: Hemingway All the Way*, combined a description of a Pacific Ocean voyage on tramp steamers with a vigorous defense of Ernest Hemingway's life and writings. The critic Edmund Wilson wrote *O Canada: An American's Notes on Canadian Culture*. Although the book was criticized because of the author's evident sympathy for the separatist French minority, it is lively and informative. NATIONAL SCIENCE FOUNDATION

ANTARCTIC SATELLITE-TRACKING PROJECT employs a large antenna to pick up data transmitted by a geophysical satellite as it passes over the South Pole.

ANTARCTICA

In 1965 the U.S. Naval Support Force began its second decade of continuous operation in Antarctica. It included nine ships and 2,500 men, and logged more than 9,000 flight hours. Its work was carried out in conjunction with some 50 scientific projects, financed and coordinated by the National Science Foundation. These projects, conducted during the Antarctic summer (October 1964–March 1965), were based at five U.S. stations manned by 150 scientists, 35 of whom remained in Antarctica through the winter. Rear Admiral Fred E. Bakutis replaced Rear Admiral James Reedy as commander of the support force on April 27, 1965.

A number of interesting observations were made, including the discovery of a pink mite within 309 miles of the South Pole. Adélie penguins were taken from their rookeries and flown inland and released. Signals from small radios placed under their flippers enabled planes to follow their course as they found their way home, guided by the sun.

U.S. Scientific Undertakings. The most ambitious summer program was the Queen Maud Land Traverse Party, which departed from the South Pole on Dec. 4, 1964, on the first leg of a journey into the last major unknown region of Antarctica. Ten scientists (8 Americans, 1 Belgian, and 1 Norwegian), collected geophysical and glaciological data along their 800-mile trek to the "pole of relative inaccessibility" (the point farthest inland). They cached their equipment for next year's successors and flew

back to McMurdo Station on Feb. 2, 1965. Five seasons will be required to complete the 5,000-mile zig-zag route to Belgium's Roi Baudouin Station on the coast at Bried Bay.

The most novel project was the audiovisual studies of the conversations of seals and of the built-in sonar device that permits them to dive for food to depths of 1,500 feet or more. The project was conducted in a six-by-four-foot steel underwater chamber equipped with hydrophones and floodlights.

As part of a larger study of radio propagation paths around the globe, a 21-mile-long antenna was laid from Byrd Station across the two-mile-deep icecap. Experiments are made with controlled, man-made, very-low-frequency radio signals transmitted along the earth's magnetic lines of force.

Information received from a special satellite-tracking unit at McMurdo Station and from a smaller unit at Byrd Station may aid in determining the exact shape of the earth. Space exploration will also benefit from drilling into the icecap at Byrd Station to a depth of 8,000 feet to trail illusive cosmic dust.

U.S. Stations. Palmer Station, on Anvers Island, was dedicated on Feb. 25, 1965. The base is occupied by five scientists and four Navy men. Under the terms of the Antarctic Treaty, ships from Argentina, Chile, and Great Britain, the three nations claiming this area, visited the station during its construction.

A new road built of crushed rock facilitated the transportation of supplies from the ice edge to McMurdo Station. The station's fresh-water capacity was nearly tripled when a desalinization plant began in February to convert seawater into drinking water. On March 31, McMurdo's nuclear reactor went into operation to provide electric power.

Hallett Station, the joint U.S.-New Zealand base, was closed in February, and it will operate only in the summer, with automatic instruments providing navigational and meteorological information.

Activities of Other Nations. The Soviet Union began moving its 8-year-old Mirnyy Station 1,300 miles west, to Molodezhnaya, where logistics are better for resupply. Mirnyy will continue as a research station. George H. Meyer, a microbiologist from the University of Texas, was the American exchange scientist at Mirnyy in 1965, while a Russian physicist, Igor A. Zotikov, conducted heat-flow investigations of sea ice at McMurdo.

Japan, which suspended operations in 1962, commissioned a new 7,000-ton icebreaker, the *Fuji*, which will transport an 18-man party to reoccupy Soya Base in the 1965–66 season. The French Dumont d'Urville Station on Adélie Coast was resupplied by the motor ship *Thala Dan*.

Ten Belgian and six Dutch scientists wintered at Roi Baudouin Station. Thirty men also wintered at the British Halley Bay Station in the Weddell Sea, and 77 more were at the six other British stations on or near the Antarctic Peninsula, where Chile and Argentina also maintain permanent bases.

ANTHROPOLOGY

Although anthropologists continued their traditional studies, there was a noticeable trend in 1965 toward a more intensive study of modern complex societies, and there was a greater emphasis on interdisciplinary approaches to understanding man and his works.

RAPO-GUILLETTE

ANTHROPOLOGY museum in Mexico City has Aztec stone, dated 1469, depicting war victories.

Interdisciplinary Trends. Anthropologists are giving increasing attention to many subjects that require greater interdisciplinary cooperation. A number of recent conferences and seminars have dealt with interrelationships between sociology and linguistics, which is a subfield of anthropology. An important seminar on sociolinguistics was held at Indiana University in the summer of 1965. Topics that were covered included linguistics and social theory, multilingualism, and language standardization.

Another current focus of interdisciplinary efforts is the relationship between genetics and human behavior. A committee of leading geneticists and anthropologists, appointed by the Social Science Research Council, is directing studies so that social scientists may learn modern genetics and biologists may learn social science. Under its auspices, scholars have concentrated on various aspects of the behavioral consequences of genetic differences in man. Subjects that were dealt with included polymor-

phism and natural selection, hereditary factors in the psychological variation in man, psychological variation in man, psychopathology, and individual differences in response to stress.

At the 24th annual meeting of the Society for Applied Anthropology, an interdisciplinary approach was focused on problems of the Appalachia region, one of the primary targets in the national war on poverty. Representatives of the Appalachian Regional Commission spoke on the general issues. Specialists presented research papers on natural resources, human geography, upgrading of human resources, locations for schools, architectural problems, demographic indicators of social change, urban migration, experiments to reduce birth rates, and approaches to community medicine. The multidisciplinary review provided a comprehensive picture of the regional problems, and it supplied the wide-ranging information necessary for formulating coordinated remedial programs. This discussion of the problems of Ap-

palachia epitomizes the shift in cultural anthropology from studies of tribal and traditional peoples to studies of modern complex societies and their problems. (See also ANTI-POVERTY PROGRAM.)

At the 64th annual meeting of the American Anthropological Association in Denver, Colo., concern was expressed about events connected with Operation Camelot, a Department of Defense research project that utilized anthropologists and other social scientists to study the backgrounds of insurgency and counterinsurgency in selected countries. The project was cancelled after Chilean social scientists protested an attempt to involve them in a study of sociopolitical factors underlying possible internal warfare in Chile. As one result of this episode, a presidential directive ordered a formal review of all government-supported overseas research to ascertain that proposed research projects will have no adverse influence on foreign policy. This series of events has crystallized several crucial professional questions for anthropologists. The first concerns the growing problem of access to foreign areas for purposes of scientific study. Because of political and social ideologies and the image of the United States abroad, it is becoming more difficult for government and privately sponsored research to be conducted in some areas of the world. Secondly, this abortive project has raised the question of the position and integrity of the American researcher in foreign countries.

Origin of Man. Dr. Louis S.B. Leakey, a noted anthropologist, asserted that three types of manlike remains were found in the Olduvai Gorge in Tanzania, East Africa, and that these types had coexisted and hence represented parallel paths toward the evolution of modern man. His views on the multiplicity of coexistent forerunners of man were challenged, but his datings from field work are generally accepted. These show that some forerunners of man lived almost 2 million years ago. Leakey spoke in Chicago in April 1965. (See also ARCHAEOLOGY.)

Enzymes and Evolution. At a meeting of the American Association of Physical Anthropologists in May 1965, Dr. Frank N. Syner and Dr. Morris Goodman reported study results based on examinations of the brains of 22 primates. They found that in the brains of primates the proportion of one type of lactic dehydrogenase (an enzyme that acts on the lactic acid in the body) increased as the level of development rose from the lowest primates to man. They also found that the proportion of a second type of lactic dehydrogenase in the brains of primates decreased as the level of development increased. There is evi-

dence, consequently, that chemical analysis of the primate brain can be utilized as a measure of evolutionary development.

Research in a Complex Society. The role of the anthropologist in the developing areas of the world is substantially different from his role in studying simpler tribal peoples. In national societies, the demands on the researcher are greater because the peoples' sensitivities to being studied make him more vulnerable to criticism.

A furor was set off in Mexico by Oscar Lewis' *The Children of Sanchez*, a book about a Mexican slum family. The book was attacked by a small group of Mexican professionals who claimed that it was subversive and defamatory to the Mexican way of life. The ensuing argument was a major controversy in Mexico during the year, and it indicates the increasing difficulty of performing anthropological research and publishing the results in countries that, in the process of rapid sociocultural change, have developed a heightened sensibility on questions concerning the national image.

Museum. The National Museum of Anthropology in Mexico City, Mexico, which went into full operation in 1965, is one of the finest anthropological museums in the world. In three miles of exhibition space, ingeniously arranged into 25 principal salons, the museum presents the past and contemporary life of the indigenous peoples of Mexico in a series of exhibits that blend aesthetic consideration and scientific exactitude. The archaeological collections range from displays dealing with early human origins to those showing the higher levels of indigenous Mexican civilizations, such as the Teotihuacan, Toltec, Aztec, Oaxacan, Veracruz, and Mayan. Conceptually and spatially integrated with these displays is a series of comprehensive ethnographic exhibits that depict present-day Mexico.

American Males. A national survey shows that American males between the ages of 18 and 79 average 5 feet 8.2 inches in height, and that those between the ages of 18 and 24 average 5 feet 9 inches in height. Elaborating on these statistics, Dr. Albert Damon, an anthropologist at Harvard University, said that some evidence indicates there is a limit to the inherited American capacity to increase in height, and that American males probably will reach a maximum average height of about 5 feet 10 inches in the not-too-distant future.

HOMINID SKULLS (upper right and lower left), found by anthropologist Lewis S.B. Leakey at Olduvai Gorge in Tanzania, have smaller brain space than skull of a modern man (upper left). The massive brow ridges and the protruding back sides of the two ancient skulls resemble skull features of Java man (lower center) and Peking man (lower right), who flourished about 400,000 to 600,000 years ago.

ANTI-POVERTY PROGRAM

BILL STRODE

POVERTY IN THE UNITED STATES, a disconcerting presence in an ever more affluent society, continued to be the target of a major federal-state program in 1965.

ANTI-POVERTY PROGRAM

A national campaign to eliminate poverty from the United States entered its second year in 1965, with thousands of volunteers and government officials active on several fronts. The Office of Economic Opportunity, headed by Sargent Shriver, supervised programs designed to help unemployed youths, elderly persons, preschool children, migrant workers, small businessmen, and others. A separate program sought to bring economic opportunities to the Appalachian Mountains region. The anti-poverty program is discussed in this article under the following headings: (1) The War on Poverty; (2) Appalachia; (3) The Job Corps; and (4) The Youth Corps.

THE WAR ON POVERTY

There is no single cause of poverty, and there is no single solution. Poverty reflects inadequate education, unemployment, poor health, deficient housing, and lack of opportunity. In the past, public and private efforts have been directed toward alleviating the effects of poverty. But in 1964 the United States government began a massive attack on the root causes of poverty. This war on poverty continued in 1965 to inspire its participants with both hope and a sense of achievement. Although the struggle will be neither brief nor easy, the anti-poverty program during 1965 gave promise that the war eventually will be won.

Economic Opportunity Act. In his State of the Union address on Jan. 8, 1964, President Johnson announced his intention to launch an all-out war on the poverty that affects 34 million Americans. On March 16 of that year he outlined his battle plans

in a draft of the proposed Economic Opportunity Act that would provide the means of attacking the causes as well as the effects of poverty.

On Aug. 20, 1964, Congress passed the Economic Opportunity Act. The act established an Office of Economic Opportunity, headed by a director appointed by the president, to coordinate the anti-poverty efforts of all segments of the federal government. Congress appropriated approximately \$800 million for the first year's operations, and \$1.5 billion for the second year of the program.

Recognizing that the poor can be found in every age group, in every circumstance, and in every section of the country, the act authorized 10 major projects: the Job Corps, Neighborhood Youth Corps, College Work-Study Program, Community Action Program (including Project Head Start and the Foster Grandparents and Upward Bound programs), Migrant Agricultural Employees Program, Volunteers in Service to America, Adult Basic Education Program, Work Experience Program, Small Business Economic Opportunity Loan Program, and Rural Loan Program.

Help for Young People. The first three years of these programs are designed to help youth. The president's study group on manpower conservation reported in 1964 that one third of all young men aged 18 would be found unqualified if they were examined for induction into the armed forces. The report added that "the majority appear to be victims of inadequate education and insufficient health services." A nationwide survey of persons who had recently failed induction mental tests (one half of the rejectees) clearly demonstrated that a major proportion of these young men were the products of

poverty. The report concludes: "They have inherited their situation from their parents, and unless the cycle is broken, they will almost surely transmit it to their children."

To break this cycle, the *Job Corps* provides for residential training and education centers, and the *Neighborhood Youth Corps* makes available job training and experience in home communities. The target population of both these programs is the 3 million youths, aged 16 to 21, who live in poverty. (See below, *The Job Corps* and *The Youth Corps*.)

The *College Work-Study Program* gives students an opportunity to work on or off campus. The student works 15 hours a week while attending classes, but he may work up to 40 hours a week during summer vacations or when not enrolled in a regular semester. In the fall of 1965, through funds from the original appropriation of \$56 million, more than 105,000 students in 1,100 institutions participated in this program. By the summer of 1966, that number will have grown to an estimated total of 135,000 students, at a cost of \$60 million. After the passage of the Higher Education Act of 1965, the College Work-Study Program was transferred to the Office of Education in the Department of Health, Education, and Welfare. It was expected that the program will help 50,000 students graduate from college each year who otherwise would not have done so.

Community Action Program. Often called the heart of the anti-poverty effort, CAP brings together community efforts and resources to combat local poverty situations in the most effective way possible. Because the requirements for fighting poverty vary from community to community, the program may range through such diverse projects as remedial education; employment information, counseling, and placement programs for unemployed youth; job training and education for unemployed adults; extension of outpatient health clinic services; legal services for the poor, including the establishment of neighborhood law firms; and special programs to improve living conditions of the elderly. The community is asked to develop programs broad enough to give promise of eliminating the causes of poverty, to enlist the aid of the poor themselves in planning and operating the programs, and to administer

and coordinate the programs through public or private nonprofit agencies.

Allocations for CAP amounted to \$240.1 million in the 1965 fiscal year, during which 415 communities, including Indian reservations and migrant worker areas, inaugurated CAP programs. The allocation for the 1965 fiscal year totaled \$650 million. CAP hopes that individuals, groups, and communities will develop the ability to solve their problems themselves.

Project Head Start began as a Community Action Program to provide preschool learning experiences, medical and dental examinations, and social services to children from low-income families who would be entering school for the first time in the fall of 1965. Without Project Head Start, these children would have been at a disadvantage when taking their place in the classroom beside more fortunate children. By the beginning of July, the program, surpassing the original expectation of assisting 100,000 children, enrolled more than 560,000 children in 13,400 classrooms in 2,400 communities. Parents participated in every phase of the program, and the poor were employed as assistants. Head Start cost \$85 million, and utilized the services of about 500,000 volunteers.

For the 1966 fiscal year, Project Head Start was extended to embrace a year-round program for children three to five years old, a summer program for those not enrolled on a year-round basis, and a follow-up program for summer Head Starters, including home visits, special tutoring, field trips, and medical care.

Poor persons over 65 years of age, totaling about 5.4 million, represent 16% of the poverty population. Under the CAP program known as *Foster Grandparents*, older Americans will be trained to care for institutionalized children and then work in paid positions as substitute parents for those children.

The CAP demonstration project, *Upward Bound*, which operated in 18 institutions of higher education in the summer of 1965, enabled 2,061 high school students from low-income families to participate in special academic and cultural programs as part of their preparation for college. In 1966, with

OFFICE OF ECONOMIC OPPORTUNITY

PROJECT HEAD START gives preschool children from low-income families a chance to acquire learning experiences. The participation by adult volunteers helped make the program succeed in 1965.

WIDE WORLD, OFFICE OF ECONOMIC OPPORTUNITY

SARGENT SHRIVER, director of the anti-poverty program, testifies before a House committee on April 12 in behalf of a continuation of the program. Map (right) shows Appalachian region (shaded area) being helped by the program.

an allocation of \$25 million, Upward Bound programs will provide 25,000 students a chance to develop their potential talents, to seek admission to college, and, hopefully, to break out of the confines of poverty.

The *Migrant Agricultural Employees Program*, administered by the Community Action Program, provides for the housing, sanitation, education, and day-care needs of migrant workers and their families. Federal grants and loans help states and localities render these services. Fifty-three grants, totaling \$15 million and benefiting more than 100,000 migrants, were approved in the 1965 fiscal year. Sixty-five grants, totaling some \$20 million, were available to assist 120,000 migrants in the fiscal year 1966. The development of these programs over the next 10 years is expected to end the impoverished circumstances of the nation's two million migrants.

Volunteers in Service to America. This organization, known as VISTA, is a domestic peace corps that permits persons aged 18 and older to participate in the war on poverty. Volunteers receive six weeks of training, work for at least a year, and receive a monthly living allowance. At the completion of their service, they are paid \$50 for each month of service. VISTA serves wherever poverty exists: in cities, country towns, and migrant camps, on farms and Indian reservations, and among the sick and disabled, the mentally handicapped, the very young, and the very old. Any state or local organization that is trying to help the poor may request the services of VISTA volunteers. During the 1965 fiscal year, requests for more than 6,500 volunteers were received from 508 sponsors. By the end of the 1966 fiscal year, the VISTA program will comprise 4,000 volunteers in 400 projects.

Other Programs. The remaining programs of the Office of Economic Opportunity are administered by other agencies of the government. In 1965, funds for the *Adult Basic Education Program* gave 37,991 persons, aged 18 years and over, the opportunity to learn the fundamental skills of reading, writing, speaking, and arithmetic. Administered by the commissioner of education, the program has available \$45 million for 1966, during which it will train teachers, develop instructional materials, and promote maximum competency in basic skills for

105,000 of the approximately 11,500,000 adults with less than a 6th grade education.

The *Work-Experience Program*, administered through the Welfare Administration, is designed to aid unemployed heads of families and other needy adults who lack the basic education and work skills necessary for employment. Participants and their families receive counsel and support, such as homemaker services and medical care, during the period of training and work experience. Some \$112,000,000 was appropriated for 1965, benefiting 88,700 persons having an estimated total of 273,000 dependents. It was anticipated that during 1966, some 109,300 persons would participate directly in work-experience programs, at a federal cost of \$150 million. As in the case of the Adult Basic Education Program, a great expansion will be required to reach the target population of 2 million adults in need of such services.

The Small Business Administration (SBA), using funds provided under the Small Business Act, administers the *Small Business Economic Opportunity Loan Program*. This program provides management counseling and loans of up to \$25,000 to the very small businesses that cannot meet regular SBA credit requirements. In 1965, 159 loans, totaling \$1,766,350, were granted. To ensure that borrowers receive the counseling and assistance they need, loans are available only in areas served by a Small Business Development Center (SBDC). These centers assist with applications, continually survey the business needs of the community, and help create jobs. Future plans include expanding the SBDC program to 39 centers and granting 2,500 loans at a cost of \$25,000,000.

The *Rural Loan Program*, administered by the Farmers Home Administration in the Department of Agriculture, lends money to low-income farm and nonfarm rural families to buy small parcels of land or finance small rural businesses. Loans may not exceed \$2,500, and to qualify, a recipient must live in the country or in a small town of not more than 2,500 people. Cooperatives serving low-income rural families are also eligible for loans.

In 1965, opportunity loans totaling \$19 million were made to more than 11,000 persons; 82 cooperatives received \$929,200. It was estimated that in 1966 a total of \$33 million would be lent to

15,700 individuals and 350 cooperatives assisting 8,750 families.

SARGENT SHRIVER
Director, Anti-Poverty Program

APPALACHIA

The year 1965 had an "Appalachian spring." In March, Congress passed, and President Johnson signed into law, the Appalachian Regional Development Act. "I sign this bill," said the president, "in the belief that we can and we shall add strength to all America by renewing the strength of this old and this honored region of Appalachia." Although the region has a great heritage, what it needs most is a future. In a sense, 1965 was the first year of that future.

The strength of which President Johnson spoke was to be generated by \$1.1 billion in federal funds, plus millions more from the Appalachian states themselves. The purpose of these funds was to provide those facilities that would raise the lagging economy of the region so that the monthly statistics of America's prosperity would no longer be followed by the words "except in Appalachia."

The Appalachian Regional Development Act. The funds provided by the act included: \$840 million for highways, \$41 million for multicounty health centers, \$17 million for land stabilization and erosion control, \$5 million for timber development, \$36.5 million for mining area restoration, \$5 million for a water resource study, \$16 million for vocational education facilities, \$6 million for sewage treatment plants, \$90 million for supplements to federal grant in-aid programs, and \$5.5 million for planning and research.

The most important tool provided for in the program was the one that cost the least money—the Appalachian Regional Commission, a joint federal-state agency headed by a federal member appointed by the president and by a state member elected from among the Appalachian governors. With a staff of only 65 people, this commission was charged with the task of doing in Appalachia what a national consensus had said must be done.

The work got off to a fast start. After the authorizing legislation was passed on March 3 and signed by the president on March 9, the commission met for the first time on April 19. On April 30, Congress passed the appropriations for the first fiscal year. Nine weeks later bulldozers broke ground to begin the 2,350 miles of new highways in the region.

This record for speedy action was not the only impressive thing about the Appalachian effort. For the first time, more than \$1 billion in federal funds was being committed to a program in which projects would be initiated by the states. The states would design the projects to fit their needs, and, once the projects were approved by the regional commission, they would execute them. Also for the first time, a regional effort was under way that fully emphasized regional planning, with the states of the region having full control over the projects within their borders.

In addition, this is the first government program that offers substantial aid, not on the basis of where it is needed, but on the basis of where it

JOB CORPS provides instruction in various skills, with the expectation that training will help young people escape the grip of poverty. Expert chefs and cooks share their knowledge (above), while students learn typing (left).

PAUL E. GLINES

MURTON R. ENGELBERG

will do the most good. Congress recognized that there are other federal and state programs to meet the more-pressing needs of the people of Appalachia. The new program was designed to solve the problems that create these needs, by raising the economy of a whole region.

Character of the Region. Why Appalachia? Why should a program for parts of just 12 states garner the votes of at least one senator or representative from no less than 48 different states? Because, as President Johnson said, renewing the strength of Appalachia would indeed add strength to all America. For example, if the people of Appalachia had the same buying power as the average American, more than \$12 billion would be added to the gross national product each year.

The theory behind the program is that the people of Appalachia should gain that buying power through economic development, rather than through welfare support. (Among the program's goals are the planned obsolescence of both "pork barrel" legislation and the dole.) To achieve a higher income level, the area needs jobs, and, to get them, its people must have vocational training in the needed skills. Industry must come in to provide these jobs, and highways and community facilities must be built to attract industry.

The development of Appalachia, begun in 1965, will last officially only six years—the legislated lifetime of the Appalachian Regional Commission. The program is just a beginning, however, because it is designed to enable the people of Appalachia to do the rest of the job themselves.

And what must be done? To answer this question, it is necessary to know about the area itself. Appalachia takes its name from the Appalachian Mountains that cut through the region. It extends from Lake Erie to northern Alabama, and, with 17 million people and 182,000 square miles, it has roughly the same size and population as California.

Appalachia is a densely populated mountainous region, where the majority of the people, by almost every index of modern life, exist at a significantly lower level than the average American. Per capita income is almost 40% below the national average, and unemployment is 50% greater.

The region has many advantages, however. Its great natural beauty gives it a potential for a growing tourist industry. It has a heavy annual rainfall, although there are no natural impoundments to store the water and prevent erosion. It also has large coal and timber resources. More than 60% of the people of the United States live in areas within 300 miles of Appalachia. These areas, which include the cities of Boston, New York, Philadelphia, Baltimore, and Washington on the east, and Detroit, Chicago, and St. Louis on the west, hold the key to Appalachia's future, for they represent both the market and the production centers that mean so much to the economy of the region.

The program begun in 1965 seeks to utilize Appalachia's advantages and overcome its disadvantages. The region's greatest need is an adequate highway network to stimulate commerce, tourism, and industry, and to enable workers to commute to distant jobs. Therefore, the bulk of the program is concerned with highways. The region's isolation had

AT CONSERVATION CENTERS, Job Corps trainees serve while learning. Boys (above) plant Ponderosa Pine seedlings at the center nursery located at Tillamook, Oreg. Youth (right) receives instruction in driving a bulldozer.

persisted mostly because of the high cost of highway construction; for example, it costs almost three times as much to build a mile of highway in West Virginia as it does in Iowa. Until 1965, the cost of construction had not been a factor in allocating federal highway funds.

The Program Is Begun. By late summer, the Appalachia Regional Commission had approved all of the recommended highway corridors, and funds for construction within the corridors were made available. New York State, which has 13 Appalachian counties, joined the commission in August. By the end of 1965, approval had been given to more than 30 local access roads, 18 mining restoration projects, most of the state land treatment plans, 10 local development district programs, and a number of grant-in-aid projects, including vocational education schools, college buildings, airports, libraries, and sewage treatment plants. For 1966, plans and blueprints were to be completed on many more projects in all 12 Appalachian states in time for the spring construction season.

What happens when the governors of Appalachia, or their representatives, meet with the federal co-chairman at least once each month? There has been freewheeling debate and discussion, but time and time again, individual state interests have been discarded in the interest of regional accord. The North and the South, liberals and conservatives, Republicans and Democrats are represented on the commission, but no major disagreement has been encountered because of these differences.

The Future. Eventually, the entire United States, as well as the people of Appalachia, will benefit from this program. The American system of government will also benefit, because the program demonstrates that the use of the full combined resources of state and local governments, together with those of the federal government, can accomplish what one state could not do alone.

The chief goal of the Appalachia program is to ensure that the incredible growth that has characterized America in recent decades will no longer bypass one tenth of its people. What had begun in the mind of John F. Kennedy when he campaigned in the West Virginia presidential primary in 1960 became a reality under President Lyndon Johnson—"creative federalism," the president called it. Al-

ready plans were being made for regional development programs in other areas, with the Appalachia program and its regional commission serving as the model.

THE JOB CORPS

Congress, concerned with the persistence of disabling poverty in the United States during a period of unparalleled general prosperity, authorized the Job Corps as part of the national war on poverty. Of special concern was the plight of hundreds of thousands of poor young men and women who are out of school and out of work, and who lack the opportunities to acquire the experience and skills that might equip them to break out of the tightening clutches of poverty. Congress appropriated \$183,000,000 to enable the Job Corps to establish in its first year nationwide residential centers where thousands of men and women aged 16 to 21 can learn to be productive and constructive citizens.

Launching the Job Corps. On Jan. 15, 1965—a cold and gray day—30 young men from the streets of Baltimore and from the mountains of western Virginia and Kentucky arrived at the first Job Corps center, Camp Catocin, situated in a national park in the Appalachian foothills of western Maryland. This small band of pioneering Job Corpsmen had taken the challenging first step out of poverty. By mid-1965, some 10,000 men and women had followed these first recruits into 48 centers in 27 states (see the accompanying table). Thus, a widely dispersed, residential, educational, and job-training system—a system without parallel in American education—was established.

The Job Corps' opportunity and challenge captured the imagination of America's youth. By mid-year, more than 230,000 young men and women had written to the Job Corps to express their interest in the program; and some 30,000 had filed applications. (In the case of men, these applications were processed principally by local offices of state employment bureaus; in the case of women, by local chapters of Women in Community Service (WICS), an organization created to screen women applicants.) Because of the clear need and interest of youth, plans were made to increase the Job Corps' capacity to 50,000 trainees.

The first 10,000 members of the Job Corps provided a clear picture of the sinister effects of poverty. Nearly two thirds had lived in substandard and overcrowded houses. Almost 40% came from families receiving public assistance. In more than 60% of the families, the primary wage earner was unemployed. In half the homes, the parents had less than an 8th grade education.

It was not surprising, therefore, that only half of the first corpsmen had completed the 8th or 9th grade of school, and that more than half had a reading level below the 6th grade. Considering such limitations, it is understandable that more than 90% had never held a job.

To equip these young men and women with skills, the Job Corps created a unique residential program that marshaled the resources of the various organizations, including the business community, universities, and agencies concerned with conserving and developing natural resources. It offered individual tutoring and counseling, both formal and informal, by trained staff members available to supervise

ST. LOUIS POST DISPATCH—BLACK STAR

NEIGHBORHOOD YOUTH CORPS gives enrollees chance to receive training and to serve their own communities. At Kinloch, Mo., young men clean roadsides.

and help enrollees 24 hours a day and on weekends. Special instructional materials for individual progress and self-teaching were adopted. To keep vocational courses up to date, private industry donated modern equipment.

Three Kinds of Facilities. The Job Corps established three kinds of facilities to serve the differing needs of its members. Some young men were sent to conservation centers managed by the U.S. Forest Service, the National Park Service, and other conservation agencies. The program in these centers, which accommodate 100 to 200 men, aims at raising basic educational skills and accomplishing much-needed conservation work. Young men who could profit at the outset from more advanced training in job skills were sent to training centers near urban areas. In these centers, with 1,000 to 3,000 men, the trainees prepare immediately for specific vocations. Young women went to centers for 250 to 450 girls, where the program emphasizes preparation for jobs and family management.

The corpsmen at the conservation centers typi-

cally spend half of their working day on projects to conserve the area's resources or to expand nearby recreation facilities. By July 1965 the men of the Job Corps had spent more than 12,000 hours fighting fires or working on fire-prevention projects. They helped control disease and insect pests on some 2,000 acres of national land, and spent 1,300 hours in forest nurseries planting and raising seedlings for reforestation. They also helped build 250 family-camping units and 30 shelters, lay more than 1,200 yards of pipe and 11,000 yards of walks, and develop 40 miles of recreational fishing streams.

These and other projects are accomplished during the time set aside each day to enable corpsmen to experience the demands, discipline, and skills of man-size work. The other half of the day is spent in the classroom on the crucial tasks of learning to read and calculate well enough to understand a repair manual, fill out a job application, or pass the Selective Service examination.

The programs at men's and women's training cen-

HENRY MONROE—PIX

ters, operated by universities, business corporations, and nonprofit organizations under contract to the Job Corps, differ from those at the conservation centers, particularly in the type and intensity of the vocational training program. The men spend full time at learning a trade and receiving a basic education. After being introduced to a variety of possible vocations, they choose a course of training suitable to their interests and aptitudes. Those who choose auto mechanics first learn to perform simple service jobs and then progress to repairing complex parts. Progress from the simple to the complex is also true of training in radio and television repair, office work, selling, the culinary arts, metal working, or data processing.

Women receive vocational training in clerical skills, retailing, food preparation, child care, health care, recreation, education, or industrial electronics. They also attend classes in cooking, shopping, nutrition, and child care to prepare them for raising children and managing a home. This practical training is combined with work to improve reading, arithmetic, and other basic skills.

The Corpsman's Future. Members graduate from the Job Corps when they are ready either for placement in a job or for more-advanced training outside the program. Graduation may be within months of entrance or after two years, depending on the type of training chosen and on individual progress.

The Job Corps enlists the aid of all organizations, public and private, in placing its graduates. Major companies, including automotive manufacturers, large retail sales chains, and nationwide franchis-

ing organizations, hire Job Corps graduates. Businessmen's councils also cooperate, and placement facilities of state employment services are used.

Most graduates find full-time jobs, but many choose other opportunities. Some volunteer for the armed services; some return to school or go on to college; some join the staff of the Job Corps. However, no matter what their choice, all who graduate have taken the first step out of poverty.

OTIS A. SINGLETARY
Director, Job Corps

THE YOUTH CORPS

The Neighborhood Youth Corps, which operates under the administration of the U.S. Department of Labor, provides work-experience programs for young men and women, aged 16 to 21, from low-income families. The corps, a component of the president's war on poverty, was authorized by the Economic Opportunity Act of 1964. It enables unemployed youths to increase their employability or to resume or continue their education. Members of the Youth Corps work on projects or perform services in the public interest. Conservation programs are especially encouraged.

Sponsors. Local sponsors of Neighborhood Youth Corps projects fall into two general categories—governmental units and private nonprofit organizations. States, counties, municipalities, and authorized subdivisions, such as park commissions, boards of education, municipal hospitals, and state and public libraries, are generally eligible to enter into cooperative agreements with the corps. Voluntary hospitals, private welfare organizations, settlement houses, and other similar nonprofit private organizations also may become sponsors.

The First Year. On Feb. 14, 1965, Secretary of Labor W. Willard Wirtz reported favorably to President Johnson on the first neighborhood youth project, in Newark, N.J. The president, in reply, observed that the 348 boys and girls enrolled in the project had been out of work and out of school but were "now performing valuable services in the city government." More than half of the boys and girls in the program had arranged to attend school at night.

The corps' first year of operation was one of development and organization. Three basic types of work programs emerged: (1) programs for students enrolled in school during the day; (2) summer programs; and (3) full-time work-experience projects for out-of-school youths.

Many Neighborhood Youth Corps projects include activities other than work experience. When needed, remedial education is provided to increase the employment opportunities of out-of-school enrollees. Testing, counseling, job development, and job referral services help youths adjust to the job market. Preselection testing and counseling are utilized to appraise the capacity and potential of individual youths.

A total of 641 Neighborhood Youth Corps agreements were concluded during the 1965 fiscal year. These agreements, represented projects in all 50 states, the District of Columbia, Puerto Rico, and the Virgin Islands. The projects employed more than 280,000 young people, of whom about 60% were men, at a cost to the federal government of about \$132,000,000. Approximately 75% of the enrollees lived in urban areas and 25% lived in rural areas or small towns.

ADEN STATE, in the Arabian Peninsula, was the scene of rioting against British policies in 1965. At right, youths stage demonstration in the Crater section of Aden on October 4.

PICTORIAL PARADE

ARABIA

A peninsula in southwestern Asia with an area of slightly more than one million square miles, Arabia is bounded on the north by Iraq and Jordan, on the east by the Persian Gulf and the Gulf of Oman, on the south by the Arabian Sea and the Gulf of Aden, and on the west by the Red Sea and the Gulf of 'Aqaba. Arabia comprises four independent states—the Kingdom of Saudi Arabia, the Yemen Arab Republic, the Emirate of Kuwait, and the Sultanate of Muscat and Oman—and 32 states linked with Britain in one form or another. The total population of the peninsula is probably less than 10 million. (For components of Arabia not discussed individually in this article, see KUWAIT, MUSCAT AND OMAN, SAUDI ARABIA, and YEMEN.)

Federation of South Arabia. The federation was established under British auspices in 1959 with six members. It now has 17 members, the most influential of which is Aden State (formerly a British crown colony), which merged with the federation in 1963. Six states in the British Protectorate of South Arabia have thus far declined to join the federation; these include the relatively important Qu'aiti, Kathiri, and Mahri sultanates, all in the eastern part of the protectorate.

The federation has an area of 60,000 square miles and a population of 700,000. The protectorate states outside the federation have an area of 40,000 square miles and a population of 300,000. Aden State covers only 75 square miles, but its population is estimated at more than 200,000.

The year 1965 was a time of crisis for the federation. Britain had promised independence by 1968, but differences over the conditions became acute. Leaders of Aden State insisted on the terms of the United Nations resolution of Dec. 11, 1963, calling for the early removal of the British military base at Aden (though on occasion they indicated readiness to negotiate on this point) and for general elections under a UN supervisory presence before independence. Britain wanted to turn the federation into a unitary state, which Aden resisted out of fear of being submerged by its less-developed neighbors. The upcountry sheikhdoms tended to go along with British policy. Yemeni and Egyptian nationalists, collaborating with dissidents from the federation, campaigned for the elimination of British power.

In March 1965, Sir Richard Turnbull, who had succeeded Sir Kennedy Trevaskis as high commis-

sioner in December 1964, invited 'Abd al-Qawi Makkawi to replace Zain 'Abdu Baharoon as chief minister of Aden State. Makkawi had opposed Aden's merger with the federation. At the end of July, Makkawi went to London for talks on the future of the federation, but these proved fruitless. A long series of disturbances in Aden culminated in late August and early September in the assassinations of the British police superintendent, Harry F. Barrie, and the British speaker of the Aden State Legislative Council, Sir Arthur Charles.

On September 25 the British government announced the Aden constitution had been suspended. Makkawi and the other Adenese ministers were dismissed, and direct rule was placed in the hands of the high commissioner. A statement issued by the high commissioner's office said that the Adenese ministers had given public support to the National Liberation Front, headed by Qahtan al-Sha'bi, which claimed to have perpetrated the assassinations. In October, 12 Arab states laid the situation in Aden before the UN Security Council. Strikes in Aden indicated continued restlessness.

Bahrain. This sheikhdom, under the rule of Sheikh 'Isa ibn Salman Al Khalifah (acceded 1961), consists of one large island (Bahrain) and a number of smaller ones with a total area of about 230 square miles and a population of 182,203 (1964 census). The capital is Manamah on the main island.

Bahrain possesses only modest oil wealth. The Bahrain Petroleum Company (Bapco) produces about 2.5 million tons a year. The Bapco refinery on Bahrain also processes large amounts of crude oil brought from Saudi Arabia by pipeline.

In March a strike by Bapco workers developed into a general strike marked by rioting. Arab nationalist resentment of British influence and dissatisfaction with the paternalistic Bahrain government contributed to the unrest. The National Progressive Front demanded the right to form trade unions. The situation calmed down in April, though the roots of the trouble remained to be dealt with.

A new currency, the dinar, was introduced on October 16. It replaces the Indian rupee.

Qatar. This sheikhdom, under the rule of Sheikh Ahmad ibn 'Ali Al Thani (acceded 1960), occupies a barren peninsula in the Persian Gulf. It has an area of about 4,000 square miles and a population of about 60,000, roughly half of which is in the capital, Doha.

The Qatar Petroleum Company on the mainland and the Shell Company of Qatar offshore produce

ARCHAEOLOGY

BRITISH TROOPS and police seek curfew breakers in the Crater area of Aden on October 3, after an outburst of rioting. Fifty Yemenis, later deported, were among 300 seized.

about 9 million tons a year. In 1965, Shell was investing £7.5 million in export facilities on the island of Halul and in other offshore operations.

Popular discontent similar to that in Bahrain brought about a state of emergency in April. The government tried to ease the situation by launching an ambitious program to improve communications, provide houses for indigent families, and develop water and sewage systems.

Trucial States. Six of these sheikhdoms lie on the southeastern coast of the Persian Gulf and the seventh, Fujairah, lies on the Gulf of Oman. The total area claimed is some 30,000 square miles, with a population estimated to exceed 100,000.

Abu Dhabi is the largest and richest of the states, though its population is very sparse. The Abu Dhabi Petroleum Company on the mainland and Abu Dhabi Marine Areas offshore together outstripped the total production of Qatar in 1964, and the tremendous reserves they are tapping indicate that Abu Dhabi will soon be in the front rank of world producers. A new agreement with the Abu Dhabi Petroleum Company, concluded in September 1965, is expected to double the share of profits received by the ruler, Sheikh Shakhbut ibn Sultan al-Falahi (acceded 1928).

No oil has been found in any of the other Trucial states, but Dubai and Sharjah are successful commercial centers. In 1965 the Persian Gulf rulers subscribed to the principle that the richer states should help the poorer, but interstate cooperation has been difficult to secure in the past.

In June, Sheikh Saqr ibn Sultan al-Qasimi (acceded 1951) was deposed as ruler of Sharjah. He charged that the British were responsible, and was welcomed as a hero of Arab nationalism in Baghdad and Cairo.

GEORGE RENTZ
Curator of the Middle East Collection
The Hoover Institution, Stanford University

Radiocarbon dating of materials found in excavations in Tanzania revealed in 1964-65 that hominids (men or manlike creatures) have inhabited the earth for as many as two million years—a much longer time than was thought probable a few years ago. This article summarizes the year's archaeological research in two sections: (1) Eastern Hemisphere; and (2) Western Hemisphere.

EASTERN HEMISPHERE

There were several notable contributions to Old World archaeology in 1964-65. Among the more important was the early dating of Bed I at Olduvai Gorge, Tanzania, a discovery which makes it certain that a much greater time must be allowed for hominid evolution and cultural development than seemed probable a few years ago. Another significant development was the new light thrown on the calendar-making abilities of prehistoric man. Evidence was presented for the existence of a lunar calendrical system in the Upper Paleolithic of Europe, and the hypothesis that Stonehenge was a calendrical calculator was reinforced.

The Lower Paleolithic sites of Torralba and Ambrona, Spain, revealed a substantial bone industry, the earliest such industry for which there is proof. Farther east, the work at Mohenjo-Daro, West Pakistan, contributed new evidence about the origins, development, and fall of the Indus civilization.

Early Date for Olduvai Reinforced. A sample of volcanic material from a layer known as Bed I at Olduvai Gorge, Tanzania, was dated by the fission-track method to 2.03 ± 0.28 million years. The sample was taken from the same deposits as two potassium-argon samples, KA 847 and KA 1043, which yielded dates of 1.85 and 1.76 million years, respectively. Because the results achieved by these two independent methods overlap substantially, they appear to be mutually supporting. This part of Bed I at Olduvai yielded both early hominid remains and stone artifacts.

Prehistoric Calendars. Gerald Hawkins of the astronomy department of Boston University first published in 1963 and 1964 his interpretation of Stonehenge, England, as a calendrical computer. Acceptance of this interpretation depended to some extent on finding other similar monuments, to which a calendrical function could be attributed. Recently, Hawkins studied the stone alignments and circle at Callanish in the Outer Hebrides, Scotland, and suggested that this monument served a purpose similar to that of Stonehenge.

Early Bone Artifacts. F. Clark Howell, professor of anthropology at the University of Chicago, and his associates continued their analysis of the Lower Paleolithic occupation sites at Torralba and Ambrona in Soria province, Spain. These sites appear to have been situated on a big-game migration route, and investigators identified a bone industry whose raw material was mainly the limb bones of an extinct species of elephant, *Elephas antiquus*. Using stone tools, they experimented with bone from a young (modern) African elephant and were able to make approximate replicas of the bone artifacts from these two sites.

New Light on the Indus Civilization. Excavation of Indus civilization sites had indicated a remarkably static cultural uniformity, but preliminary work at Mohenjo-Daro, West Pakistan, showed the first evidence of cultural change during man's long oc-

cupation of this region. Both hydrological and archaeological studies suggested an explanation for the final abandonment of the site: silt levels in the occupation areas and a 70-foot-thick retaining wall of brick, probably built as a flood-prevention measure, indicate that there was temporary flooding. Continued battles with flood waters may have led eventually to the abandonment of the city. For the first time, the lowest occupation level was determined. Boring showed that occupation levels at Mohenjo-Daro go down to 39 feet below the present level of the surrounding plain, and 24 feet below the modern water table.

Town Planning in Neolithic Turkey. Continued excavations at Çatal Hüyük, in southwestern Turkey, have brought forward yet more evidence of Neolithic ritual. The work at this site in 1965 revealed a degree of Neolithic town planning not evident from previous work. The houses are aligned in rows and blocks, with storerooms filling the gaps. Many walls are aligned over some distance, with house plans alternating between a long side and a short side facing the street. With some modifications, this plan can be seen to persist over a period of time. These discoveries imply a considerable sense of social organization and a measure of surveying ability on the part of the inhabitants.

Neolithic Idols in the Cyclades. Excavation of a Neolithic site continued on Saliagos, one of the Cycladic islands of Greece. It now appears that the site was originally fortified, a rarity for the Neolithic period and the area. An underwater survey demonstrated that at the time of Neolithic occupation, Saliagos was linked by dry land with two other islands of the Cyclades group, Paros and Antiparos. Probably the most important finds of the 1965 season were two marble figurines. One is of the Cycladic "fiddle idol" type, a stylized human figure shaped like a violin. The other is more naturalistic and resembles examples from Anatolia.

Earliest Greek Colony in Italy. On the island of Ischia, excavations were begun on the acropolis at Pithekussai, traditionally the earliest Greek colony in Italy. Work on the acropolis has already yielded pottery of the 8th century B.C., and material that demonstrates contact with Etruria.

Minoan Trading Post. Excavations on the island of Kythera, off the southern coast of Greece, demonstrate that this Bronze Age settlement was culturally Minoan as early as the Middle Minoan I period, early in the 2nd millennium B.C. It was probably a wealthy trading outpost of the Cretan "Minoan Empire." The site apparently was occupied until about 1450 B.C., then abandoned.

Byzantine Church. The Church of St. Polyeuktos, built between 524 and 527 A.D., has been identified in Istanbul. This church antedates by a few years the building of St. Sophia by the Emperor Justinian. The excavations, begun in 1965, should throw considerable light on the development of Byzantine architecture.

"Dark Age" Site at Glastonbury. As a part of the lengthy research at Glastonbury, England, excavations were started recently on Glastonbury Tor. The present site of Glastonbury Abbey cannot be dated earlier than about 600 A.D., but potsherds of the 6th and possibly 5th century A.D. have been found at Glastonbury Tor. These fragments were imported from the eastern Mediterranean, and provide additional evidence of contact between that area and Celtic Britain. In addition, the 1965 excavation revealed an enameling workshop, a discovery of considerable importance for the study of metalworking in the British Isles.

Problem of the "Brochs" Solved. A problem of considerable importance to Scottish archaeology was solved as a result of the excavations at Clickhimin, Shetland, by John R.C. Hamilton. The origin of "brochs," stone towers dating to the earlier 1st millennium A.D., has been uncertain and open to considerable speculation. The excavations at Clickhimin show a series of buildings, the first being a small stone-walled fort of the 4th to 2nd centuries B.C. This fort had tenemented buildings against the inside of the wall, and as time went on the exterior walls were raised until the fort became a tower, or "broch." This upward extension was probably a protection against attack by fire, which, as is evidenced by the many vitrified forts in Scotland, was a potent siege weapon.

BERNARD WAILES

NICHOLAS DAVID

*Department of Anthropology
University of Pennsylvania*

WESTERN HEMISPHERE

The Bureau of American Ethnology and the Department of Anthropology of the United States National Museum merged in 1965. The new organization, known as the Smithsonian Office of Anthropology (SOA), is divided into a Division of Cultural Anthropology and a Division of Physical Anthropology. The SOA will cooperate with the National Park Service in archaeological salvage operations of the River Basin Surveys. Bureaus of American Ethnology bulletins will discontinue publication with No. 200. They will be replaced by a new series, *Smithsonian Contributions to Anthropology*.

EXCAVATING ANCIENT TURKISH CITY of Çatal Hüyük (below), investigators found that its inhabitants possessed a rudimentary knowledge of town planning. Statues of females (right and left) were found in the ruins.

Georgia. Cooperation continues between industries and scientific institutions in salvaging prehistoric sites endangered by the expanding U.S. economy. Georgia Kraft Company, presently constructing a \$45 million paper mill near Cottonton, Ala., will salvage archaeological data which would otherwise be lost through the construction of the mill and its supporting services.

Virginia. Members of the Virginia Archaeological Society helped excavate the first fortified Indian village to be discovered in the Shenandoah Valley of northern Virginia. In addition to a stockade line, the site has yielded hut outlines, pottery, stone and bone tools, charred corn and nuts, and a number of graves. The Shenandoah Valley was a main north-south route for Iroquois war parties, which probably explains the use of fortifications. Pottery recovered indicates that the site belonged to the late prehistoric period, perhaps the late 16th century.

Nearly 700 items were recovered from the sludge below the waterline of a garden well on the John Custis IV property at colonial Williamsburg, Va. Unusually well preserved because of having been sealed in the mud below the waterline were such plant remains as Dutch holly and American boxwood leaves, as well as twigs and leaves of 17 other plants from the period 1730-46. Among other materials recovered were over 70 bottles labeled "John Custis 1713."

Florida. Probably the most spectacular find of the past year was in underwater archaeology. Salvage operations off the east coast of Florida, near Ft. Pierce, brought up treasure reportedly worth \$1.6 million. The treasure was believed to have come from one or more of the 10 ships of the Spanish Plate Fleet that were wrecked in this area during a hurricane in July 1715. Included in the recovered treasure are silver and gold coins, jewels, silver ingots, and a variety of other objects. The recovered objects are important historically and interesting archaeologically.

Kansas. In the Great Plains, two parties financed by National Science Foundation grants obtained new data on contacts between Plains and Pueblo Indians. One party, excavating a site in central Kansas, uncovered two long, narrow house pits and a number of storage artifacts. Potsherds of the local ware were common, and included some 40 sherds of glaze-paint Rio Grande ware, as well as a few scraps of metal and a glass bead. The site is believed to date between 1500 and 1650 A.D. The second party, working in western Kansas, also recovered Pueblo sherds as well as a turquoise bead. These came from the floor of what was apparently a hogan-like structure, and were like the ware of the Dismal River Indians of Kansas and Nebraska.

Utah. In the Green River basin of northeastern Utah, excavations were made in a stratified site near a high mountain spring. Lower levels yielded lanceolate projectile points believed to date from between 4000 and 2000 B.C. Upper levels of the site had side-notched points belonging to the late prehistoric or historic period. In northern Utah a site of the Fremont culture was excavated. The 10 circular pithouses uncovered were two feet deep and from 13 to 19 feet in diameter. Each had a central clay-rimmed firepit and four roof supports. Several subfloor storage pits had similar features. Seven burials were discovered, augmenting the scanty skeletal material available from this culture. Artifacts were typical of the Northern Fremont.

Guatemala. Two vaulted and brilliantly decorated tombs containing the skeletons of five persons who died in the 1st century B.C. were uncovered beneath a small shrine-like building deeply underlying the north acropolis at Tikal, a ruined city in northern Guatemala. Tunneling exposed the shrine, which was decorated with exterior polychrome frescos of six ornately garbed individuals painted in black, red, pink, and yellow. The first tomb contained three skeletons. One skeleton was of an adult, on whose chest had been arranged two large, lidded bowls. One bowl contained the disarticulated remains of an adult and the other the articulated skeleton of an infant. In the second tomb were found the remains of an adult; at his feet was a second figure who had originally been seated. Six human figures had been painted in black on the red plaster walls.

Mexico. Salvage operations at Rancho La Ventilla, at Teotihuacán, Mexico, were devoted largely to a single complex, Palace B, the full extent of which is still unknown. Preparation of the land for irrigation had removed the uppermost construction, but the remaining buildings began with early Teotihuacán II, and extended into early Teotihuacán III. A major accomplishment of this work was the recovery of 180 burials and some 4,000 pottery vessels. Several burials yielded remains of fibrous wrappings which had been painted red. Cremation was rare. Miniature vessels were abundant. Burial offerings included figurines of a white material resembling stucco, as well as many tiny manos (grindstones) of unbaked clay. Five small altar-like masonry platforms were found, four of which contained infant burials. Several poured-adobe walls were found, some with burials in them.

Caribbean. The islands of Aruba, Curaçao, and Bonaire in the Netherlands Antilles were surveyed and test excavations were carried out. Preliminary reports indicate the presence of sites from Paleo-Indian, Meso-Indian, and Neo-Indian periods. Two large Arawak village sites were discovered on the northwestern coast of Haiti. At one site, archaeologists found aboriginal gold ornaments in the refuse. The Marban site, in the Dominican Republic, has yielded a radiocarbon date of 2170 ± 160 B.C., which is by far the earliest date yet obtained for any site in the West Indies. In Jamaica, the Arawak White Marl site between Kingston and Spanishtown, where great numbers of shells and animal bones were recovered, is expected to yield significant data on Arawak dietary patterns in Jamaica during the period 900 to 1400 A.D.

Colombia. The Puerto Hormiga shell mound may rank with the Valdivia sites in Ecuador in producing the oldest pottery known in the Americas. A charcoal sample has been dated at 2250 ± 250 B.C., corroborating the earlier determination of 2910 ± 170 B.C. obtained from a shell sample. Puerto Hormiga pottery from all levels of the excavation includes crude fiber-tempered ware in consistent association with a more sophisticated sand-tempered ware. The latter ware bears incised, punctate, and relief decoration.

Ecuador. Work continued in the vicinity of the El Inga Paleo-Indian site near Quito, Ecuador. It consisted of surface collecting, as well as test excavation, in the hope of discovering deeper and more significant stratigraphy. The tests had as an additional purpose the acquisition of carbon for dating.

ARCHITECTURE

PIX

DESIGN OF NEW NATIONAL MUSEUM IN ISRAEL, by American architect Frederick Kiesler, employs white and black to symbolize purity and suffering.

ARCHITECTURE

Although it was becoming more and more difficult to justify further concentrations of commercial activity in the downtown sections of American cities, existing urban renewal projects were continued and new ones were begun in 1965. The year also saw innovations in the use of building materials and the execution of new concepts in structural design. And one of the giants of modern architecture, Le Corbusier, died in August 1965.

Urban Renewal Projects. A characteristic urban renewal project is Constitution Plaza in Hartford, Conn. Here, distinctive glass-walled buildings—one is boat-shaped in plan and the others are rectangular—housing a hotel and offices are disposed around wide and handsomely landscaped plazas on the roof of a multistory parking structure. The plaza level stands on wide bridges well above the existing street grid. The project is much admired for the elegance of its design, especially the landscaping by Sasaki, Dawson, and DeMay, but it has been criticized for not fitting in with the remainder of downtown Hartford.

A number of other American cities are attempting, without extensive rebuilding, to bring new life to their downtown areas. The main street of Fresno, Calif., was turned into a pedestrian mall by Victor Gruen and Associates, with sculpture, fountains, kiosks, and gardens. Similarly, Tarapata-MacMahon Associates enlivened the central square of Canton, Ohio; and an American Institute of Architects award

was given to Eugene, Ore., for its downtown renewal project. Privately financed redevelopment in the center of Rochester, N.Y., produced a covered, air-conditioned shopping mall—Midtown Plaza—for which Victor Gruen and Associates were architects.

These projects are designed to retain in downtown areas the glamour that is attaching itself to those enormous suburban shopping centers and their acres of parking facilities. They must offset, in the colder and wetter parts of the country, shopping centers with covered malls where, as the advertisements for a center in Tacoma, Wash., put it, it is "70° and dry". (See also CITY PLANNING.)

New Arenas. The move indoors, with the accelerating development of air-conditioning equipment and of structural methods for spanning wide spaces, is not confined to cold climates or to shopping centers. Houston's Astrodome, covering a baseball field, spans 642 feet of air-conditioned interior space (see HOUSTON). Far more dramatic are two arenas designed by Japanese architect Kenzo Tange for the 1964 Tokyo Olympics, which bring great crowds indoors under structures held aloft on concrete masts suspended by steel cables and sweeping downward into horizontal arches. Two masts hold the roof over a swimming pool building, and one carries the roof over a stadium for basketball.

New Building Complexes. Another complex of Kenzo Tange's, the Yamanashi Broadcasting Center in Japan, is almost a small city, formed of hollow masonry cylinders that contain services and vertical

circulation, and support the corners of enormous rooms hung in space. A contemporary phenomenon of striking similarity is the Knights of Columbus building in New Haven, Conn., designed by Kevin Roche of Eero Saarinen & Associates. The floors of this 35-story building are to be held on four hollow cylindrical columns at their corners. The building will be diagonally placed on the street grid, the better to serve as entrance to the city from a highway connector.

Notable Structure. The year's most dramatic project by Eero Saarinen & Associates was the Gateway Arch in St. Louis, Mo. It was the realization of the plans for which Eero Saarinen had won the 1947 competition held to choose the best design for a riverside park in the city. The great, parabolic-arched "gateway to the West," built along the Mississippi River, was topped out in 1965. (See SAINT LOUIS.)

Two other major urban structures designed by the Saarinen firm were both in Manhattan. One—a high-rise building distinguished by a great glassed court around which the offices will rise—is being designed for the Ford Foundation. The other, completed and occupied in 1965, is the Columbia Broadcasting System's 38-story concrete building on New York's Avenue of the Americas. It is distinguished by the simple, solid covering of the building's frame with triangular, granite-covered piers. The piers project from the plan of windows so that when viewed from an angle the wall of the building seems made entirely of the heavy stone and the windows seem to disappear. The piers are unadorned at the top and plunge without modification into a granite base below the sidewalk level. The building stands free on all four sides, and in an area of huge thin and shining structures mostly of glass, it carries an air of extraordinarily impressive solidity.

Far higher than the powerful mass of the CBS Building, the John Hancock Center, whose architects are Skidmore, Owings, and Merrill, is scheduled to

be built on the Chicago lakefront. The building's tapered shaft will rise 100 stories to a height of 1,100 feet, and will be braced by great diagonal struts. The Alcoa building in San Francisco, by the same firm's branch office, similarly demonstrates diagonal bracing in its outer surface.

Other Projects. Two small architectural commissions demand attention for their independence. One, a house by Robert Venturi for his own use, in Chestnut Hill, Pa., is at first glance a conventional gabled house with lopsided fenestration, but on closer inspection displays an attempt to reconcile contrasts. Described by one critic as a "rational ambiguity" and a "consistent distortion," the house can be considered a piece of "serious whimsy" of polemic importance far beyond the limits of the building itself. The other project is the design by the young Dutch architect Aldo Van Eyck for a Protestant church in the Netherlands. Called the "Wheels of Heaven," it combines four skylit circles into an irregular square in order to achieve at once an inward- and outward-looking form whose interaction the architect conceived as essential to his building task.

Le Corbusier. On Aug. 27, 1965, the great Swiss-French architect, Charles-Edouard Jeanneret-Gris, known for decades as Le Corbusier, died while he was swimming in the Mediterranean. The man who had come increasingly to be honored for his innovations and inventions, from the skyscrapers in the park to the clear expression of skeletal structure to a latter-day masking of concrete sculptural form, was at the height of his powers, with his studio full of work in progress and his influence far and away the most powerful in the world.

One of Corbusier's projects, a city hospital in Venice, is of especial interest for its horizontally organized, separated but carefully connected pavilions, some of which are positioned on columns over the Venetian lagoon. The whole building is at

ROGER STURTEVANT

INTERIOR OF CHAPEL in Pebble Beach, Calif., using unfinished wood and local fieldstone to echo strength and dignity of natural surroundings, won American Institute of Architects award for designer Robert F. Olwell.

PERKINS AND WILL PARTNERSHIP

MEDICAL CENTER in New Haven, Conn., was completed in 1965. All buildings of the Yale-New Haven Medical Center are grouped around a spacious and sunny courtyard area. The center was designed by the Perkins and Will Partnership, with E. Todd Wheeler as consultant.

EZRA STOLLER

OFFICE BUILDING in Moline, Ill., designed by Eero Saarinen & Associates, spans a stream. For unity, both interior and exterior use steel that has formed a self-protecting oxide. The design won a 1965 AIA first honor award.

ARCTIC REGIONS

The United States, Canada, and the Soviet Union continued to conduct scientific research in Arctic regions during 1965.

United States. A major project of the Arctic Research Laboratory at Barrow, Alaska, has been the operation of two drifting ice stations in the Arctic Ocean. One of the stations, Arlis II, an ice island about 70 feet thick, was used as a base for research in marine geophysics, oceanography, marine biology, and meteorology. After four years of occupation, Arlis II drifted into the swift East Greenland Current, which swept it rapidly southward into warmer waters between Iceland and Greenland early in 1965. The 21 scientists on the ice island were placed in a hazardous position, but they were rescued by the U.S. Navy icebreaker *Edisto* on May 8, 1965.

The other drifting station, Fletcher's Ice Island, continued to be a base for oceanographic research. This station has been in use since 1952.

The U.S. Coast Guard icebreaker *Northwind* made an oceanographic survey of the Kara Sea and the northern part of the Barents Sea during the summer of 1965. The original plan was to make the first traverse of the Northeast Passage by a United States ship, but the planned west-to-east passage across the top of Eurasia was not completed because of political considerations in reference to the USSR. The *Northwind* turned back at the Vilkitski strait between the Taimyr Peninsula and Severnaya Zemlya, but the trip was successful because hydrographic, gravitational, and magnetic data were collected over the broad Soviet continental shelves.

Early in September the University of Alaska was host to the First International Scientific Meeting on the polar bear. The meeting was attended by delegates from Canada, Denmark, Norway, the USSR, and the United States. The presentations made by each country stressed the need for some form of restriction on killing polar bears.

Canada. The Polar Continental Shelf Project continued into its sixth year of geophysical, hydrographic, and geodetic surveys of the northern Canadian islands and continental shelf. Seismic studies across the sedimentary basins of the continental shelf are delineating the crustal structure in that region. Systematic gravity surveys were made on a five-mile grid spacing over a wide area.

Two interesting discoveries were made in the Mould Bay region in 1965. One finding was that seismic waves in the region had velocities that were strongly dependent on azimuth. The other was the remains of a Jurassic plesiosaur. The plesiosaur, a marine reptile about 35 feet long, was excavated.

Canadian research facilities continued to be active. The Northern Canadian Research Laboratory at Inuvik is making biological and environmental investigations in the Mackenzie River delta. The McGill Subarctic Laboratory at Schefferville in Labrador specializes in the study of permafrost. The newest Canadian research facility, which specializes in oceanography and glaciology of Arctic fjords, is located at Tanquary Fjord on Ellesmere Island.

Soviet Research. The USSR continued to operate drifting research stations in Arctic regions. Station SP-12 was evacuated in April 1965, and SP-14 was set up in the Chukchi Sea during the same month. SP-13 was in operation throughout the year.

ROBERT DAMORA

FOR PREFABRICATED HOUSE on Cape Cod, Mass., architect Robert Damora received a 1965 AIA award of merit.

once an efficient hospital design and an integral part of the dense fabric of the city of Venice. The design shows how far Corbusier had come since his youthful pronouncements of 1922 when he proposed the widespaced elevated skyscrapers in a park that still provide the image for the rebuilding of our cities.

Awards. The 1965 American Institute of Architects First Honor Awards went to the Eleanor Donnelly Erdman Memorial Chapel at Pebble Beach, Calif., for which Robert Olwell of Reid & Tarics was the designer. It is a simple and sensitive gable-roofed, pole-supported, lattice-walled small chapel in a pine forest. Another award went to Sert, Jackson, & Courley for Harvard University's married students' housing facility—a complexly wrought and thoughtfully integrated group of three-, five-, and seven-story terraced rows and three 22-story towers, built around courts. An award went to I.M. Pei and King and King for the Syracuse (N.Y.) University School of Journalism—an opulent freestanding pavilion, planned in the shape of a Greek cross, under a heavy square roof, on a large base. And finally, an award was given to Eero Saarinen & Associates for the John Deere Administrative Center in Moline, Ill., whose exposed frame of self-controlled rusting steel is set across a valley on a beautiful wooded site.

AIA Merit Awards went to Crites & McConnell for a house in the woods, Cedar Rapids, Iowa; to Kirk, Wallace, & McKinley for a Japanese Presbyterian Church in Seattle, Wash.; to William D. Warner for the Gordon School, a small village-scale school building in East Providence, R.I.; to Roger Lee Associates for apartments in Berkeley, Calif.; to R. Commel Roessner for a complex of apartments grouped around an intimate court in Austin, Texas; to Robert Damora for a prefabricated tract house at New Seabury, Cape Cod, Mass.; and to Clark & Beutler for an addition to an old building on Market Street in San Francisco, Calif.

ARGENTINA

Argentina continued to recover from the recession of 1962-63, although its economic growth was slower in 1965 than in the previous year. In addition to pressing economic problems, the country experienced a widening polarization of political forces between Peronist and anti-Peronist groups, and there were renewed outbreaks of violence by extremist elements. In the field of foreign affairs, Argentina's relations with the United States were impaired by the U.S. military intervention in the Dominican Republic.

Political Division. The struggle between supporters and opponents of exiled former President Juan Domingo Perón came to a head in the congressional election of March 14, which was a test of strength for the 17-month-old government of President Arturo U. Illia. Leaders of the Peronist Popular Union party (UP) were granted full political freedom during the campaign, but candidates of Illia's People's Radical party (UCRP) asserted that support of the UCRP was the only alternative to a return of dictatorial Peronism.

This tactic was only partly successful. In the contest to elect 99 of the 192 members of the Chamber of Deputies, the UP and some smaller Peronist-oriented parties won 35% of the popular vote, while the UCRP received 29%. The UCRP retained 69 seats, or 36% of the voting strength in the chamber, but the Peronists gained 36 seats for a total of 52, or 27%. The chief losers were the seven center and rightist parties, which held 51 seats (27%) among them. The remaining 20 seats (10%) were scattered among small left-wing and independent parties.

With its limited strength, President Illia's government found it difficult to secure important legislation in the new congress and to maintain party loyalty. Senators Ricardo Bassi and Edgardo Acuña, leaders of a rebel bloc in the UCRP, resigned from the party when the government decided to increase its contribution to the International Monetary Fund

despite a campaign pledge by President Illia to sever relations with the fund.

Dissatisfaction with the government's policies was also reflected in the resignation on November 23 of Gen. Juan Carlos Onganía, army commander in chief. As leader of the Colorado faction in the armed forces, Gen. Onganía had supported President Illia. His resignation stirred rumors of a military coup that failed to materialize.

Peronist Activities. Through their domination of the General Confederation of Workers (CGT), the Peronists harassed the government during the year by carrying out the fourth and fifth stages of their battle plan initiated in 1963. The fourth stage included three crippling 24-hour strikes by employees of the state railway system in February. The unions obtained a retroactive wage increase of 25% and an additional 17% increase in 1965.

The fifth stage of the battle plan, announced on May 1 by José Alonso, secretary general of the CGT, was less successful. CGT leaders publicly demanded the recall of Perón from Spain. Mrs. Isabel Perón, third wife of the ex-dictator, arrived in Buenos Aires to lead a rally on October 17, the 20th anniversary of Perón's rise to power. The government issued a decree barring political activities by labor unions, and violent clashes ensued among Peronists, anti-Peronists, and the police.

The Tacuara Movement. The Tacuaras, an ultraconservative nationalist group with Nazi affiliations, caused disturbances during the year. In January, police discovered a cache of arms and evidence of a plan to attack the homes of 25 prominent Argentine Jewish leaders. Horst Eichmann, son of the executed Nazi war criminal, Adolf Eichmann, was one of the 636 persons suspected of terrorism who were arrested in August after the slaying of two university students, but he was released with 59 others for lack of evidence.

Domestic Problems. Economic problems intensified political unrest during 1965. The cost of living rose 22% in 1964, and climbed 23% in the first ten

Gross National Product (1962): \$8,320,000,000.

National Income (1962): \$6,758,000,000; average annual income per person, \$316.
Economic Indexes (1964): Industrial production, 103 (1958=100); agricultural production, 119 (1956-57=100); cost of living, 600 (1958=100).
Manufacturing (metric tons, 1964): Petroleum products (1963), 13,338,000; cement, 2,817,000; meat (1963), 1,483,200; wheat flour, 2,244,000; crude steel, 1,265,000; sugar, 998,000; cotton yarn, 89,160.
Crops (metric tons, 1964-65 crop year): wheat, 9,150,000 (ranks 7th among world producers); maize, 4,900,000 (world rank, 7th); citrus fruit, 822,000 (world rank, 7th); grapes, 2,190,000; rye, 685,000; barley, 820,000; oats, 800,000; wool (1963), 186,000 (world rank, 4th); peanuts, 420,000 (world rank, 6th).
Minerals (1964): natural gas (1963) 110,313,000,000 cubic feet (world rank, 10th); crude petroleum, 100,370,000 barrels (world rank, 14th); lead, 25,641 metric tons (world rank, 19th); silver, 1,944,509 troy ounces (world rank, 17th); uranium, 11 metric tons (world rank, 7th).
Foreign Trade (1964): Exports, \$1,410,000,000 (chief exports, 1964: meat, \$303,000,000; wheat, \$223,000,000; maize, \$156,000,000; wool, \$117,000,000); imports, \$1,077,000,000 (chief imports, 1963: nonelectrical equipment, \$242,500,000; transport equipment, \$177,500,000; iron and steel, \$93,300,000; electrical equipment and apparatus, \$80,800,000).
Chief trading partners (1963): U.S. (took 11% of exports, supplied 26% of imports); Italy (took 16% of exports, supplied 13% of imports); West Germany (took 7% of exports, supplied 11% of imports).
Transportation: Roads (1964), 84,008 miles (14,156 paved); motor vehicles (1964), 1,264,721 (automobiles, 696,848); railways (1963), 22,790 miles; merchant vessels (1964), 163 (1,115,000 gross registered tons); state airline, Aerolineas Argentinas; principal airports—Bahía Blanca, Buenos Aires, Córdoba.
Communication: Telephones (1964): 1,425,002; television stations (1964), 13; television sets (1964), 1,600,000; radios (1963), 5,500,000; newspapers (1959), 233 (daily circulation, 3,186,000).

WIDE WORLD

ARTURO UMBERTO ILLIA, president of Argentina since Oct. 12, 1963, has tried to bring governmental stability to a country beset by serious economic problems and torn by civil strife. His efforts to develop Argentina's resources and to end their exploitation by foreign interests became more difficult to accomplish in 1965, when his opponents, the Peronists, made substantial gains in congressional elections.

The son of Italian immigrants, Illia was born in Pergamino, Buenos Aires province, on Aug. 4, 1900. He received a medical degree from the National University of La Plata in 1927 and became a practicing physician. He was elected to the provincial senate of Córdoba in 1935. Consistently anti-Peronist, he served as vice governor of Córdoba from 1940 to 1943, and in the Chamber of Deputies from 1948 to 1952, when opponents of Perón were dismissed from office. His election as governor of Córdoba in 1962 was voided by the Peronists. He was elected president of Argentina on July 29, 1963.

months of 1965. Argentines ate less beef, as the government shipped more meat to maintain export levels. In July, two large United States-owned meat-packing plants shut down and laid off 4,800 employees. The companies blamed their losses on rising costs and an overvalued peso.

A large factor in the inflation was the continuing budgetary deficit, which obliged the government to turn to the Central Bank for more credit and paper money. About half the deficit was due to losses in operating the state railways. After increased fares failed to solve the problem, the government in August proposed a sweeping reorganization of the rail system by reducing the work force from 200,000 to 160,000 in four years and modernizing equipment. The unions involved immediately expressed opposition, and the plan was scaled down.

Increased outputs in the steel, automotive, and synthetic fiber industries were signs of industrial recovery, although the gross domestic product increase in 1965 was not expected to equal the 8.4% increase of 1964. Unemployment, which reached 250,000 in Greater Buenos Aires in mid-1963, was cut in half a year later and further reduced in 1965. The government urged employers and unions to limit wage increases to the 22% granted to state employees, but most private settlements were higher.

External Economic Problems. Argentina experienced serious foreign trade difficulties in spite of its having achieved the largest wheat exports in 25 years. The Soviet Union ordered 2.1 million tons, and Communist China 2.6 million. The sale of wheat to China and half the sale to the Soviet Union were for hard currency, with the remainder going for petroleum fuels and machinery. The government also entered barter agreements with the United Arab Republic and Italy to obtain oil in exchange for wheat.

It was estimated that the country would have to import \$101 million worth of oil products in 1965 to meet shortages due partly to the decline in do-

mestic production after the cancellation of contracts with 13 Argentine and foreign drilling companies in 1963. Following extended negotiations, most of the disputed agreements were settled in 1965, and several companies were expected to continue operations under restricted conditions.

By the end of 1964 the Argentine government had the third largest external debt among the developing countries, after India and Brazil. The total foreign debt was \$3,356 million, including a public debt of \$2,424 million. After months of discussion, 12 of Argentina's creditor nations (10 western European countries, the United States, and Japan), known as the Paris Club because they hold their conferences in Paris, agreed to postpone 60% of the payments due on commercial credits in 1965.

The government at first rejected the advice of International Monetary Fund experts to impose austerity measures on grounds that these would interfere with economic recovery. However, it later mended relations with the fund and with the International Bank for Reconstruction and Development in order to qualify for additional assistance. Argentina sought a \$40 million standby loan.

Because of difficulties in meeting the balance of payments and in marketing exports, the peso was devalued three times during 1965. The latest devaluation on December 5 set the exchange rate at 188 pesos to the U.S. dollar. In 20 months the official value of the peso declined 29%.

Foreign Affairs. Relations between Argentina and the United States were strained by several events in 1965. In February, government officials charged that the United States was withholding aid under the Alliance for Progress until the oil contract dispute was settled. This was denied by Ambassador Edwin M. Martin.

During the Dominican crisis in April, Argentina promised to contribute troops to a hemispheric peace force. However, hostility in the congress prevented the administration from complying, and the repercussions set off a cabinet crisis in June.

During anti-American demonstrations, Allison Temple Wanamaker, U.S. consul in Córdoba, was seriously wounded by unknown attackers on June 7. A reduction in Argentina's sugar quota for 1965 by the U.S. Congress also created bad feeling.

A long-standing border dispute between Argentina and Chile became critical when a Chilean guard was killed by an Argentine patrol on November 9. A joint commission was set up to negotiate a settlement.

ELECTIONS IN ARGENTINA gave rise to noisy Peronist demonstrations featuring portraits of Juan and Eva Perón.

WIDE WORLD

FLOODS IN ARIZONA struck the Phoenix and Tucson areas in late December 1965. Here, a lineman works above the rampaging Salt River to restore electric power after a transmission tower collapsed.

UPI

ARIZONA

Arizona's regular legislative session in 1965 was held from January 11 to April 20—a record-setting 100 days. The Legislature passed 110 bills, one of which was vetoed by Democratic Gov. Sam Goddard. The Legislature also held four special sessions.

Regular Session. In the regular session, legislation included the passage of a public accommodations law and the establishment of a civil rights commission. Compulsory annual automobile inspections were repealed, and the gasoline tax was increased by 1 cent a gallon, to a total of 7 cents.

In other legislative action, \$466,000 was appropriated to implement the federal Kerr-Mills medical care program; the deadline for the statewide tax reappraisal program was extended to 1967; and a three-member board was created to administer state applications of the Federal Land and Water Conservation Fund Act.

Special Sessions. Three of the four special sessions resulted from the failure of the Legislature to enact Governor Goddard's school-equalization and capital-financing programs. Agreement between the Legislature and the governor was deadlocked through the first two special sessions, but in the third the Legislature passed a compromise school-equalization bill and referred to the voters a proposed constitutional amendment raising the state debt limit from \$350,000 to \$100 million. The amendment was soundly defeated at the polls in October by a margin of 4½ to 1, but the voters did approve a bond issue of \$33 million for city and school improvements in the Tucson area.

The fourth special session dealt with congressional redistricting and state legislative reapportionment. The Legislature failed to reach agreement on redistricting Arizona's three congressional seats, but did agree to reapportion the state Senate, increasing its membership from 28 to 31.

Economy and Business. While the state's economy during the first half of 1965 operated at lower levels than in 1964 (particularly in Tucson), it improved in the last quarter. The Anaconda Copper Company announced plans to spend \$65 million over a five-year period on copper development in the Tucson area. The state continued to lead the nation in copper production.

Tucson's morning *Arizona Daily Star* was sold to the evening *Daily Citizen* for \$10 million, thus

placing both of the city's daily newspapers under single ownership.

Crime. Tucson was rocked during the year by a series of alleged murders, notably that of Zenith Radio Corporation heir Eugene (Stormy) McDonald III and of three teenage girls. The McDonald death later was ruled a suicide. Of three suspects in the

ARIZONA · Information Highlights

Area: 113,909 square miles.

Population: 1,635,000 (1965 est.).

Chief Cities (1965 est.): Phoenix, the capital (520,000); Tucson (245,000); Mesa (49,000); Tempe (45,000); Scottsdale (44,000); Glendale (31,000); Yuma (26,500); Flagstaff (22,000).

Government: Chief Officers—governor, Samuel Pearson Goddard (Democrat); secy. of state, Wesley Bolin (D); atty. gen., Darrell F. Smith (Republican); treas., Bob Kennedy (D); supt. of pub. instr., Sarah Folsom (R); chief justice, Lorna E. Lockwood. **Legislature** (convened Jan. 11, 1965): Senate, 28 members (26 Democrats, 2 Republicans); House, 80 members (45 D, 35 R).

Education: School enrollment (1964-65)—public elementary, 299,800 pupils (11,124 teachers); public secondary, 105,475 pupils (4,420 teachers); nonpublic schools, 36,200 pupils (1,100 teachers); college and university (fall 1964), 61,834 students. **Public school expenditures** (1964-65)—\$159,000,000 (\$451 per pupil); average teacher's salary, \$6,670.

Public Finance (fiscal year 1965): Revenues, \$304,584,499 (3% sales tax, \$23,888,297; motor fuel tax, \$23,124,110; federal funds, \$48,817,568). **Expenditures**, \$294,246,377 (education, \$121,667,381; health, welfare, and safety, \$47,618,063; roads and highways, \$97,616,421).

Personal Income (1964): \$3,530,000,000; average annual income per person, \$2,233.

Public Assistance (fiscal year 1965): \$29,012,806 to 59,615 recipients (aged, \$10,131,146; dependent children, \$13,912,426).

Labor Force (employed persons, July 15, 1965): Agricultural, 34,600; nonagricultural (wage and salary earners), 462,400 (16% manufacturing, 24% trade, 22% government). Unemployed persons—30,900.

Manufacturing (1963): Value added by manufacture, \$617,413,000 (primary metals, \$94,026,000; nonelectrical machinery, \$51,680,000; electrical machinery, \$86,533,000; fabricated metals, \$22,896,000; food and products, \$76,196,000).

Agriculture (1964): Cash farm income, \$451,397,000 (livestock, \$163,662,000; crops, \$282,581,000; govt. payments, \$5,154,000). Chief crops (tons)—cottonseed, 349,000 (ranks 6th among the states); barley, 290,000 (rank, 9th); sorghum grain, 234,000 (rank, 8th); citrus fruits, 221,000 (rank, 3rd); potatoes, 98,000 (rank, 20th); grapes, 12,500 (rank, 7th); hay, 1,027,000; corn for grain, 13,000; wheat, 48,500; oats, 4,800.

Mining (1964): Production value, \$534,364,000 (ranks 10th among the states). Chief minerals (tons)—copper, 690,988 (ranks 1st among the states); lime, 177,000 (rank, 11th); uranium ore, 102,258 (rank, 7th); zinc, 24,690 (rank, 11th); silver, 5,811,000 Troy ounces (rank, 2nd); gold, 153,676 Troy ounces (rank, 3rd); iron ore, 4,500 (rank, 14th); lead, 6,147 (rank, 5th).

Transportation: Roads (1965), 39,065 miles (18,338 surfaced); motor vehicles (1964), 907,730; railroads (1963), 2,077 miles; aircraft (1964), 2,439 (156 airports).

Communications (1965): Telephones, 604,300; television stations, 10; radio stations, 56; newspapers (1964), 13 (daily circulation, 400,000).

latter case, two were tried and convicted, while the third awaited trial at the end of the year. Superior Court Judge Richard Royston again enjoined police and prosecuting officers from talking about the triple-murder case to press representatives. His order aroused nationwide interest as to whether the freedom of the press was being infringed in this instance.

Floods. At the year's end, record rain and snow-fall throughout the state caused severe floods in Phoenix and Tucson. Property damage, amounting to millions of dollars in both cities, was most extensive in Phoenix.

Power Failure. In November a power failure occurred in the Phoenix area of the Salt River Power District, resulting in a four- to five-hour blackout.

ARKANSAS

The General Assembly met four times in 1965 and took action in nearly every major area of the state's affairs. In the midst of its regular session, the Assembly was ordered by a federal court to redraw the state's four congressional districts. Its decision not to attempt that task during the 60-day session made special sessions necessary.

Legislative Sessions. The first special session, held May 24 to June 8, equalized the congressional districts and also enacted a pay-as-you-go road program. The latter replaced a \$150 million highway bond proposal which had been submitted to voters by the regular session and defeated.

A second special session was called by Gov. Orval E. Faubus on November 2 to take action to discourage new race tracks in Arkansas and to consider 21 other stated items. The legislators passed bills on the racing issue and all but one of Faubus' other proposals. However, the House declined to adjourn without authorizing the payment of 1965 state income taxes in two installments. The session adjourned on November 4 after the governor compromised on the tax relief question by calling a third special session to consider that issue only.

The final session was held on November 6 and lasted only 30 minutes, during which it voted to permit installment payment of the 1965 income taxes.

Taxation. Legislators raised the tax on cigarettes from 6 to 8 cents per pack, and on horse- and dog-race betting, from 5 to 6%. To finance the pay-as-you-go road-building program, the legislature raised the gasoline tax by 1 cent and the diesel fuel tax by 2 cents, and increased license fees for most vehicles.

Some loopholes were closed in the state's use tax, and a state income tax withholding program was created, effective Jan. 1, 1966. The withholding provisions were planned to produce a large amount of revenue through concurrent collections on both 1965 and 1966 incomes. A measure also was passed that requires banks holding state funds on time deposit to pay interest.

Reapportionment. Early in the year a federal court ordered both the equalization of congressional districts by population and the reapportionment of the General Assembly. The Assembly carried out the first task, and later was redistricted by the State Board of Apportionment. The changes in the As-

sembly affected the House more than the Senate because the practice of assigning one representative to each county was abandoned.

Voter Registration. Legislators passed an enabling bill which required county voter registration clerks to establish Arkansas' first permanent, free, and nondiscriminatory registration system. Registration appeared to be near completion at year's end, and there were no published reports of attempted discrimination.

Education. The legislature voted funds to help raise Arkansas teachers' pay by an average of about \$1,000 per year, to open seven more vocational technical schools, and to begin educational television.

A junior college enabling bill also was enacted. Later in the year, Phillips County voters approved a tax increase to help launch the state's first county junior college.

Sports. The University of Arkansas' Razorbacks were undefeated in 1965 for the second successive football season. Their 22 consecutive victories set a new record for a Southwest Conference team.

UPI

ARMY

The U.S. Army expanded in troop strength and operational units in 1965 as, together with other branches of the country's military forces, it engaged in direct combat in support of South Vietnam's bloody struggle against Communist insurgency. War requirements rendered academic such long-standing questions as whether the Army should have at least a million men, as so many of its experts believed; whether it should have another division, as its top leaders had long sought; and whether one of its divisions should have air mobility by being equipped with a large complement of helicopters. All of these objectives were realized in 1965.

Strength. The Army began the year with an authorized strength of about 961,000 officers and men. Its strength at the end of the year was authorized at 953,094. The reduction was due to the fact that a number of Army installations were closed.

As the U.S. commitment in Vietnam grew, however, an increase of 235,000 in Army personnel was authorized. In September, draft calls were increased substantially. In October the training of certain Army National Guard and Reserve units was intensified, indicating their possible mobilization. At the end of the year the Army was building toward a strength of 1,188,094 men, including the formation of the recommended 17th division.

Vietnam. The Army bore the principal American burden in Vietnam. Its contributions were threefold: (1) logistical, including armed helicopter support for South Vietnamese combat units, and build-

ing and providing matériel for supply depots, airfields, and a major new port; (2) advisory, with officers and men accompanying South Vietnamese combat units in the field, including Special Forces teams with South Vietnamese local defense forces in remote areas; and (3) direct combat.

The Army committed part or all of some of its most famous outfits to the war. These included the 173d Airborne Brigade, the 1st "Big Red One" Infantry Division, the 101st "Screaming Eagles" Airborne Division, and the new 1st Cavalry Division (Airmobile).

While the Vietcong continued their ambush and terrorist tactics in South Vietnam, the challenge of powerful Army units supported by aerial bombings apparently caused the enemy to reduce large-scale attacks and to revert to earlier small-scale guerrilla raids. (The U.S. Marines experienced a similar tactical change in their sector.)

Deployments. In addition to the more than 75,000 men in Vietnam by October 1965, the Army also had sizable commitments in other places outside the continental United States. There were more than 250,000 Army men in Europe, and more than 90,000 in the Pacific and Far East, including 40,000 in Korea. In April and May, during the civil war in the Dominican Republic, the Army had its entire 82d Airborne Division of 14,800 men in that country. After an Inter-American Peace Force was established, the United States reduced the size of its force.

Combat Readiness. During the year, the Army continued to address itself to the problems of both nuclear and conventional warfare, although in Vietnam

ARMY TROOPS of the 1st Cavalry Division, the first airmobile unit, prepare to debark at Qui Nhon, South Vietnam, in July. Helicopters are used to transport troops during their attacks on Vietcong guerrilla bases.

UPI

U. S. ARMY

STANLEY ROGERS RESOR was sworn in as secretary of the Army on July 7, 1965, succeeding Stephen Ailes. He had served as undersecretary of the Army from April 5, 1965, after active service in the Army during World War II and a distinguished career as a lawyer. As secretary of the Army he immediately took steps to meet the needs of the escalating war in Vietnam.

Resor was born in New York, N.Y., on Dec. 5, 1917. His father was Stanley Resor, an outstanding figure in the world of advertising. He graduated from Yale and received a law degree there. During World War II he saw active service in France, Belgium, and Germany, rising from 2nd lieutenant to major and winning the Silver and Bronze Stars as an artillery officer in the Battle of the Bulge. After the war he returned to legal practice with the firm of Debevoise, Plimpton, Lyons and Gates in New York City, where he remained until his appointment as undersecretary of the Army.

it had to cope with a type of insurgency that more often required police tactics than regular military techniques. No major new weapons deployments were carried out in 1965 comparable to the installation of 200-mile-range Pershing missiles in Europe the year before. The M-113 personnel carrier and the new M-60 were fairly well distributed throughout the Army.

The outstanding development in Army combat readiness in 1965 was in aviation. During the year the number of Army aviators increased from 8,276 to 9,074, and by the end of the year the Army had more than 7,000 aircraft (including those assigned to the Reserves), of which some 2,300 were deployed in Vietnam. The January budget authorized the purchase of 1,018 new aircraft, mostly helicopters, but at midyear an increase of 60 percent was authorized in the rate of UH-1 Iroquois helicopter production, and of 100 percent in the rate of CH-47 Chinook helicopter production. The Army increased its separate helicopter companies by more than 50 percent.

The Army was authorized in June to organize an experimental airmobile division—the 1st Cavalry—which received speedy orders to go to Vietnam. The new airmobile division had 434 aircraft (428 helicopters and 6 fixed-wing aircraft), compared with 101 aircraft (97 helicopters and 4 fixed-wing) in the Reorganization Objective Army Division (ROAD). With this number of aircraft, one third of the 1st Cavalry could be airlifted at one time, and the remainder could be transported by shuttling the aircraft back and forth or by making use of other Army and Air Force support planes. One brigade of the division had a parachute-jump capability.

The new airmobile division improves the balance between firepower and maneuverability. This balance was upset by significant increases in firepower after World War II, but by using helicopters to deliver men and weapons, as in the operations in Vietnam, the division can exploit surprise and swift reaction tactics. The vertical entry of units to the battlefield, and their withdrawal the same way, makes it possible to recycle combat forces, placing the Army on the threshold of an entirely new approach to the conduct of land battle.

Shortages. A dispute developed in August and September between the Senate Preparedness Subcommittee and President Johnson's administration over reported shortages in supplies available for the war in Vietnam. A staff study by the Senate unit indicated that potential shortages existed in a wide range of items. There were reports that combat units in Europe, particularly the 7th Army, were being "starved" because supplies had been diverted to Vietnam. Secretary of Defense Robert S. McNamara denied the allegations, however.

Research and Development. The Army continued to develop the Nike-X antimissile missile. In September it awarded a large contract to the Western Electric Company for continuing certain aspects of the development, in the hope that enough progress could be achieved to warrant a decision to install the antimissile missile system as a defense against long-range ballistic missiles.

Work continued on a design for a special-purpose individual weapon (SPIW) which will combine the point-target capabilities of a conventional rifle with the area-target capability of the 40-millimeter grenade launcher. The Lance missile system to replace the Honest John free rocket also underwent further development, and an advanced aerial fire support system was conceived as an aerial-weapons platform to supplant existing armed helicopters. In addition, the Army was developing a new family of tactical radios for long-, medium-, and short-range use.

Reserves. The administration sought in 1965 to carry out a merger of Army Reserve units with the National Guard. Under the plan, the authorized drill-paid strength of 700,000 in the reserve forces (400,000 in the National Guard, and 300,000 in the Army Reserves) would be reduced to 550,000. The plan met with opposition in Congress and from the Reserve units themselves. Congress, in its defense appropriations bill for the fiscal year beginning July 1, 1965, finally barred an outright merger.

Thereupon, the secretary of defense ordered the dissolution of a sizable portion of the Army Reserve units and designated three National Guard divisions and six National Guard brigades, along with a handful of Army Reserve units, as a special priority force to receive intensified training. The effect was to accomplish most of the original objectives of the merger plan. In deference to Congress, the secretary of defense said he would program the 700,000-man Army Reserve Forces as originally authorized, but he doubted whether the strength of the Army Reserves could be maintained.

The Army Reserves, although officially programmed for 300,000, had a year-end strength of 261,654 after the ordered dissolution of some 751 Reserve units. About 50,000 men were given the choice of transferring to the National Guard or being placed in a Reserve pool.

Administration. Stanley R. Resor became secretary of the Army on July 7, 1965 (see the accompanying biographical sketch). David E. McGiffert became undersecretary of the Army in September. Gen. Harold K. Johnson continued as chief of staff of the Army, and Gen. Creighton W. Abrams remained as vice chief.

JACK RAYMOND
Pentagon Correspondent, "The New York Times"

GEORGE CSERNA

"THE RESPONSIVE EYE," an exhibit of "optical" art at the Museum of Modern Art in New York, was one of the most influential shows of 1965.

ART

Public attention shifted in 1965 from "pop" to "op" art. Op (for optical) art chooses as its subject matter perceptual processes. It is completely abstract and arouses interest purely by dynamic color interaction and optical illusion. Unlike pop art, with its disquieting use of sometimes frivolous, sometimes sinister commonplace images, optical art seemed reassuringly earnest and joyous.

The kinship of optical art to scientific studies of perception gave it a respectable seriousness. In fact, some scientists were included among the exhibitors. But the scientific aspects of optical art should not be overemphasized. Its bright colors and bold patterns create a carnival-like atmosphere. Although fashion designers and publicity men were quick to exploit the novelty of optical art, it is no sudden fad. Its major exponents, Josef Albers, aged 77, and Victor Vasarely, aged 57, have been working in this mode for many years.

Perhaps more than painting, though, sculpture in all styles challenged the sensibilities of viewers in 1965. Over the past decade, sculpture has experienced a renaissance unprecedented since the 15th and 16th centuries. In New York a stabile by Alexander Calder and a large bronze sculpture by Henry Moore were dedicated at Lincoln Center for the Performing Arts. In St. Louis a 630-foot concrete and steel arch designed by the late Eero Saarinen became the civic symbol. New sculpture in the galleries included tableaux by Edward Kienholz and George Segal; cloth sculpture by Joseph Kurhajec, Claes Oldenburg, and Richard Lindner; strange boxes by Donald Judd, Larry Bell, and Robert Morris; and kinetic constructions by Len Lye.

Festival of the Arts. Throughout the United States,

contemporary art continued to assume an increasingly important role in public life without losing its avant-garde experimentalism. Of special importance to American artists was the White House Festival of the Arts on June 14. The festival signaled a new federal involvement in culture. A National Council on the Arts was formed, and a comprehensive exhibition of modern painting and sculpture was shown at the White House. President Johnson also signed a bill establishing a National Foundation on the Arts and Humanities, authorized to spend \$21,000,000 a year to encourage the arts.

Exhibitions. More than 20 important shows in the 1965 season featured optical art. The most significant was "The Responsive Eye," which opened at the Museum of Modern Art, New York, and then traveled to St. Louis, Seattle, Pasadena, and Baltimore. Other shows included: "Washington Color Painters," at the Washington Gallery of Modern Art, Washington, D.C.; "Arte Programmata," which, in a nationwide tour, featured kinetic art from Italy; and, in New York, "Color Dynamism, Then and Now," at the East Hampton Gallery; "Vibrations," at Martha Jackson; "Impact," at Greer; and "Groupe de Recherche d'Art Visuel," at Contemporaries.

Optical art was also seen in New York one-man shows by Leon Polk Smith, Larry Poons, Gene Davis, Piero Dorazio, Bridget Riley, Reginald Neal, Ellsworth Kelly, John Goodyear, Richards Anuszkiewicz, Ad Reinhardt, and Kenneth Noland. At the Wise Gallery, works by two communications experts, Bela Julesz and Michael Noll, were executed by a digital computer and a microfilm plotter.

Sculpture exhibits in New York stressed experiments and innovations that ranged from color-and-motion studies to almost irreducibly simple objects. Electric lighting was used in the work of Martial

OPTICAL ILLUSIONS gave effect of whirling or pulsating motion to many "op" works. This "op" painting was in the Museum of Modern Art exhibit.

UPI

Rayssé, at the Iolas Gallery; Don Flaven, at the Green Gallery; and Michael Steiner, at the Fischbach Gallery. Charles Hinman, in his first one-man show, displayed stretched canvas wall constructions at the Feigen Gallery. The Byron Gallery featured a "Box Show," and Carl André filled the De Nagy Gallery with styrofoam slabs. Some of the other important sculpture exhibitions at New York galleries were: Ernest Trova (Pace), Joseph Cornell (Stone), Richard Stankiewicz (Stable), Rudolf Hoflehner (Odyssey), Isamu Noguchi (Cordier-Ekstrom), Seymour Lipton (Marlborough), Reuben Nakian (Egan), Robert Hudson (Frumkin), Arnaldo Pomodoro (Marlborough), Joseph Goto (Radich), and Frank Gallo (Graham). The major sculpture retrospective of the year displayed the work of Alberto Giacometti at the Museum of Modern Art.

Several outstanding exhibitions of so-called old masters of avant-garde painting were held in New York: Marcel Duchamp and Man Ray (Cordier-Ekstrom), Fernand Léger (Chalette and Rosenberg galleries), Kurt Schwitters (Marlborough), Gustav Klimt and Egon Schiele (Guggenheim), Alexander Jawlensky (Hutton), and Joaquín Torres-García (Fried). American synchromist paintings by Patrick Henry Bruce, Andrew Dasberg, Stanton Macdonald-Wright, and Morgan Russel were shown at the Knoedler Gallery.

A particularly powerful exhibit was the Edvard Munch show mounted by the Guggenheim. Over 120 of Munch's paintings, drawings, and prints were exhibited: Many were from Scandinavian collections, and had never before been seen in the United States. This exhibit and a revival of the work of the Swedish painter Ernst Josephson (1851-1906), at the Huntington Hartford Gallery of Modern Art in New York, indicated a continuing interest in expressionism.

Various forms of realism also were represented by New York shows. The work of William Merritt Chase was exhibited at the Gallery of Modern Art; "Robert Henri and His Circle," at the American Academy of Arts and Letters; "George Luks and Contemporaries," at Chapellier; Reginald Marsh, at the Gallery of Modern Art; Camille Pissarro, at Wildenstein; an Ivan Albright retrospective, at the Whitney; and modern portraiture, at the New School.

Other interesting exhibitions in New York galleries included: Willem de Kooning (Stone), Robert Diebenkorn (Jewish Museum), Pierre Soulages (Kootz), William Baziotés (Guggenheim), R.B.

Kitaj (Marlborough), Grace Hartigan (Jackson), Ben Nicholson (Marlborough), Joan Mitchell (Stable), Helen Frankenthaler (Emmerich), Alfred Jensen (Graham), Jules Olitski (Poindexter), Lee Gatch (Staempfli), Wayne Thibaud (Stone), Robert Motherwell (Museum of Modern Art), Stuart Davis (Whitney), and Larry Rivers (Jewish Museum). The Rivers show, which opened at Brandeis University in the spring and then traveled, added his "Russian Revolution," a 30-foot-long assemblage, for the New York opening. One of the most extensive surveys of American painting to date at the Metropolitan Museum displayed almost 500 works from the 1700's to the present.

Large surveys of modern art were mounted throughout the nation. In the University of Illinois' "Biennial of Contemporary American Painting and Sculpture," abstractions outnumbered representational works two to one. In "Art Today," at the Albright-Knox Gallery in Buffalo, N.Y., one half of the space was devoted to "machines" using various combinations of lights, motion, and sound. The Los Angeles County Museum presented "New York School, The First Generation," which included 122 important works painted during the 1940's and 1950's by William Baziotés, Willem De Kooning, Arshille Gorky, Adolph Gottlieb, Phillip Guston, Hans Hofmann, Franz Kline, Robert Motherwell, Barnett Newman, Jackson Pollock, Richard Pousette-Dart, Ad Reinhardt, Mark Rothko, Clifford Still, and Bradley Walker Tomlin. Brown University mounted an exhibit in two parts devoted to postwar painting and sculpture. Contemporary English artists, such as Bridget Riley, David Hockney, Peter Blake, and Allen Jones, were featured in the Washington Gallery of Modern Art show, "London: the New Scene." Of special interest was a relatively small exhibit of 100 contemporary American drawings at the University of Michigan Museum of Art.

As in the recent past, the major shows of old masters during the year were seen outside New York City, although Finch College (in New York) displayed a distinguished group of Genoese painters ranging from Cambiaso to Magnasco. The Detroit Museum of Art mounted one of the most important exhibits of the season—"Art of Italy, 1600-1700." The Herron Art Institute, Indianapolis, presented "The Romantic Era, Birth and Flowering," and the Newark Museum showed "The Golden Age of Spanish Still Life Painting." John Singleton Copley and Hendrick Terbrugghen were featured in important ex-

hibitions at the National Gallery, Washington, D.C., and the Museum of Art, Dayton, Ohio, respectively.

Noteworthy New York exhibits of non-Western art included: a loan exhibition of sculpture from 22 Indian museums, at the Metropolitan; the Singer Collection of early Chinese art, at Asia House; and "Masterpieces of the South Seas," at the Museum of Primitive Art. A traveling show, "Treasures from Japan," opened at the Los Angeles County Museum.

Among controversial showings were several New York exhibits of erotic art. They included "Sex and Violence," a protest show by artist William Kent at the Castellane Gallery, and "Contemporary Erotica," at the Van Bovencamp Gallery.

Museums. The most important museum news of 1965 was the opening of the new Los Angeles County Museum, designed by William L. Pereira, and the renovation and air-conditioning of 43 galleries at the Metropolitan Museum of Art, New York. The Metropolitan also installed the Thomas J. Watson Library, which has 155,000 volumes, reading rooms, and numerous private study alcoves.

At the Sterling and Francine Clark Art Institute, Williamstown, Mass., rare drawings from the Clark collection were displayed publicly for the first time. The institute also purchased the art library of Duveen Brothers, 12,000 volumes valued at \$700,000. The Cincinnati Art Museum completed a \$3,000,000 improvement program. In San Diego the Timken Art Gallery opened with old masters from the Putnam Foundation.

The National Gallery, Washington, D.C., placed on exhibit for the first time all 240 paintings of the Chester Dale collection. Seventy-five works from the Thannhauser collection, which was bequeathed to the Guggenheim Museum, New York, were installed in newly constructed galleries. An important group of paintings and prints by Grant Wood were acquired by the Municipal Art Gallery, Davenport, Iowa, making it the principal owner of Wood's work. A distinguished collection of ancient Chinese bronzes, owned by Chester Dale Carter, went to the Princeton University Art Museum. The Avery Brundage collection of Asian art was presented to the M.H. DeYoung Memorial Museum, San Francisco. Some of the other major museum acquisitions in the United States were: Jawlensky's *Helene with Red Turban* (Guggenheim); David's *Count Étienne Gérard*

(Metropolitan Museum); Toulouse-Lautrec's early work, *Au Cirque: dans les Couloirs* (Newark Museum); a complete retrospective exhibition of the kinetic sculpture of Jean Tinguely (Museum of Fine Arts, Houston); and Louise Nevelson's monumental sculpture, *Homage Six Million* (Jewish Museum, New York).

Museum involvement in the constantly increasing tempo of creation and exhibition has raised the question of whether a museum's primary function is to display and preserve recognized masterpieces, propagate new ideas, or objectively mirror current activity in the arts. An example of museum involvement is a project undertaken in 1965 by leaders of American Reform Judaism, who started a campaign to raise \$2,000,000 for a religious art center in New York. The primary purpose of the center will be to initiate artistic projects dealing with Jewish religious and cultural themes.

Art Thefts and Vandalism. Goya's portrait of the Duke of Wellington, stolen from the National Gallery in London in 1961, was returned on May 22, 1965. The unknown thief, after sending gallery officials a series of unsuccessful ransom notes, deposited the painting in a railway baggage office and forwarded the receipt to gallery officials.

Several Vatican treasures, including manuscripts by Francesco Petrarca and Torquato Tasso, were stolen from the Vatican Museum on November 26 and recovered the following day. The thieves threw the loot, carefully wrapped, from a speeding car into the shrubbery of a villa on the outskirts of Rome.

More serious than thefts, however, is the rising

incidence of vandalism in museums all over the world. During 1965 no less than 23 paintings were seriously disfigured in the Uffizi Gallery, Florence. Figures in the paintings had their eyes gouged out and faces slashed. At the Corcoran Gallery, Washington, D.C., nine large canvases were damaged. The vandals attacked both old and new paintings, including works by the 19th century landscapist Albert Bierstadt and the contemporary "combine painter" Robert Rauschenberg.

More and more museums are installing special safety devices in order to protect their treasures. For the past several years the Cleveland Museum has had its galleries under television surveillance.

Sales. The American industrialist Norton Simon created an uproar at Christie's, the London auction house, when he obtained a Rembrandt portrait of the artist's son Titus with a near-record bid of \$2,234,000. The auctioneer had closed the bidding, but Mr. Simon, contending there was an irregularity, had the bidding reopened and won the portrait.

Mr. Simon was less successful, however, in his attempt to buy Leonardo da Vinci's *Portrait of a Young Woman* from the collection of Prince Franz Josef II of Liechtenstein. It was reported that he offered \$6,000,000 for the Leonardo—the highest bid for a painting ever recorded—but the prince, whose collection of old masters is considered the most valuable still in private hands, refused to sell.

The most controversial sale of the year involved a "Renaissance" bust purchased by the Metropolitan

Museum for \$225 at Parke-Bernet. Museum experts claimed that the work may have been modeled by Leonardo da Vinci. The bust's former owner, H. Hamilton Rice, had paid \$200,000 for it. Impressionists, postimpressionists, and moderns dominated the scene at two major Parke-Bernet auctions in April and October. Several world records were set at the April sale. A private collector purchased Cézanne's *House at L'Estaque* for \$800,000, breaking all auction records for a modern painting. Degas' *Ballet Rehearsal* was sold for \$410,000, and Bonnard's *Tall Mirror* brought \$155,000. Total sales were \$3,385,600—the largest amount ever realized at an auction of post-1870 canvases.

The value of abstract expressionist paintings, mainly from the Robert Scull collection, was tested at an auction in New York. The top price of \$37,000 was paid for De Kooning's 1955 *Police Gazette*. Works by Clyfford Still, Barnett Newman, and Robert Rauschenberg went for \$29,000, \$26,000, and \$20,000, respectively.

Sotheby and Co., London, reported a record turnover of \$47,651,870 for the season. The demand for impressionists and postimpressionists remained insatiable. There was also a consistent interest in abstract expressionists.

Awards, Honors, and Grants. At the invitation of the U.S. Information Agency, Walter Hopps, director of the Pasadena Art Museum, selected the United States section of the 8th São Paulo Biennál, in which 50 nations participated. The seven artists chosen to represent the United States were Barnett Newman, Robert Irwin, Frank Stella, Larry Bell, Donald Judd, Larry Poons, and Billy Al Bengston.

The John Simon Guggenheim Foundation gave fellowships to 14 painters and sculptors, including George Ortman, Lyman Kipp and Thomas Stearns. The Brandeis University Creative Arts Medal was awarded to Mark Rothko. Other Brandeis citations went to painter Kenneth Noland and art historian Alfred Barr. University of Illinois purchase awards went to James Brooks, Paul Jenkins, Erle Loran, and Salvatore Scarpitta. Recipients of Copley Foundation awards included John Altoon, Edward Kienholz, and Lucas Samaras.

Kress Foundation grants in art history were made to the University of California (\$100,000 over three years to strengthen publication in the field), the Cooper Union Museum (\$100,000 over four years to help preserve the institution), and, in various amounts, Columbia, Yale, Notre Dame, Miami (Ohio), Minnesota, Pennsylvania, Bryn Mawr, Howard, Tulane, and Williams. The San Francisco Foundation provided a grant to establish a major print-making center at the San Francisco Art Institute.

In the United States, several important commissions were given to sculptors. Jacques Lipchitz made a very lively statue for the University of Minnesota, and José de Rivera executed a stainless steel construction for the American Iron and Steel Institute in New York.

The American Academy of Arts announced the election of Alexander Calder as a member. Lewis Mumford was reelected president. The National Institute of Arts and Letters selected Marcel Breuer, Adolf Dehn, Naum Gabo, and Jacob Lawrence to membership. Andrew Wyeth received the institute's Gold Medal for painting.

Awards to writers on the arts were made to Ramsay MacMullen (Arthur Kingsley Porter Prize), Sydney J. Freedberg (Charles Rufus Morey Book

EDVARD MUNCH exhibition at the Guggenheim Museum included *The Artist's Model*, and over 120 other works.

NEW ART MUSEUM in Los Angeles was dedicated with a fireworks display on March 30. The Los Angeles County Art Museum is largest museum of art west of the Mississippi.

Award), and Brian O'Doherty (Mather Award). Paul Mellon, whose collection of English painting was put on view at the Royal Academy, London, in 1964, was awarded the 1965 Royal Society of Art's Benjamin Franklin Medal for his contribution to Anglo-American understanding. (See also PRIZES AND AWARDS.)

Obituaries. Important artists and scholars of art who died in 1965 included: Milton Avery, 72, American landscape painter; Alan Burroughs, 67, a pioneer in the analysis of art by X-ray; Le Corbusier (Charles Edouard Jeanneret-Gris), 77, one of the major modern architects; Burgoyne Diller, 59, one of America's most eminent geometric abstractionists; Alfred Frankfurter, 59, scholar and editor-president of *Art News*; Paul Sachs, 86, connoisseur, art historian, and educator; Charles Sheeler, 82, dean of American "precisionists"; David Smith, 59, internationally renowned sculptor; and Simon Rodilla (Sam Rodia), about 90, the immigrant Italian tile setter who built the fantastic "Tower of Watts" in Los Angeles.

ARTHRITIS

Efforts to determine the cause and prevention of the major arthritic diseases were intensified in 1965, and effective treatments of the diseases were made more readily available to the victims.

Rheumatoid Arthritis. Many researchers looked for a possible living microorganism, such as a mycoplasma (PPLO), as a causative agent in rheumatoid arthritis. Experiments indicated that the abnormal response, which is accompanied by a rise in the rheumatoid factor in the serum of a patient, might be more protective than harmful to the patient.

In 1965, indomethacin was released for general prescription. However, this new drug causes dizziness, a possibly serious side effect. Clinical use of dimethyl sulfoxide (DMSO) failed to substantiate

claims of its effectiveness in treating rheumatic diseases.

Osteoarthritis. Fundamental studies on the biochemical and physical properties of cartilage indicated that concepts of osteoarthritis as a passive senile condition might be wrong. In experimental operations on the osteoarthritic hip, a change in the direction of pressure at the joint led to a regeneration of the cartilage and an apparent arresting of the disabling condition. But it will take a number of years before a complete assessment of this method of treatment can be made.

A model of the human condition of congenital hip dysplasia was studied in susceptible strains of dogs. This ailment leads directly to severe osteoarthritis in older persons.

Gout. Many studies of gout and of uric acid metabolism were carried out in 1965. One investigation pointed up a direct relationship between the acute attack of gout and the crystalline structure of uric acid. This finding gave medical workers a clearer picture of diseases which resemble gout but which are caused by other crystal deposits.

Another study discovered a new disease in children with cerebral palsy. It shows a markedly elevated serum uric acid and causes bizarre behavior.

Tests of the effects of alcohol on gout revealed that an acute attack followed the ingestion of alcohol only when the subject took the drink on an empty stomach. In this situation, the liver is forced to produce lactic acid, which inhibits the excretion of uric acid and brings on the attack.

Drugs helpful in controlling acute attacks were phenylbutazone and the new drug, indomethacin. Colchicine was still being used diagnostically and to suppress chronic attacks. Allopurinol, an enzyme inhibitor for the synthesis of uric acid, helped patients who did not respond to other therapy.

ASIA

International conflicts and internal strife continued to plague Asia in 1965. The war in Vietnam was accelerated, and hostilities broke out twice between India and Pakistan. During the second Indian-Pakistan clash, heavy fighting continued for a month, and sporadic fighting went on much longer. Another border war threatened to break out between India and Communist China. In the Middle East there was relative quiet, although the civil war in Yemen raged on for the first half of the year, until a compromise settlement was reached.

In addition, a number of existing political structures and governments in Asia were subjected to severe stresses. The secession of Singapore from Malaysia revealed the inherent weakness of the young federation. An abortive revolution in Indonesia led to a radical realignment of the political forces in that sprawling archipelagic state. A general election in Ceylon resulted in an abrupt change of that country's domestic and foreign policies.

Alliances and Realignment. The widening divergency in policies and attitudes between the two Communist giants—the Soviet Union and Communist China—remained a basic factor in the international relations of Asian countries. The Sino-Soviet split was marked by the tendency for North Korea and even North Vietnam to look to far off Moscow, rather than to neighboring Peking, for aid and leadership.

Meanwhile, both of the Asian alliances in which the United States has a direct interest—the South East Asia Treaty Organization (SEATO) and the Central Treaty Organization (CENTO)—were in disarray. Also, the Commonwealth of Nations was placed in an agonizing position as its members con-

sidered the internecine Indo-Pakistani conflict and the secession of Singapore from Malaysia. While many nations that were former friends and allies displayed a wary neutrality or even a new-found animosity toward each other, the two long-term antagonists, the Soviet Union and the United States, came together in an unusual combination to enforce peace between India and Pakistan.

Trends Favorable to the West. In terms of the cold war, the developments of 1965 in Asia provided the West with some grounds for optimism. There was reason to take comfort from the trends perceptible in South Vietnam. On the whole, the failure of the leftist coup in Indonesia seemed likely to be beneficial to the West. The changes resulting from the elections in Ceylon were clearly for the better from the West's point of view. Finally, although the Chinese Communists remained firmly in control of that enormous nation, they lost ground on the diplomatic front. By the end of 1965, Communist China was causing less apprehension among its opponents than it had a year earlier, and was held in less respect by its allies and associates.

FAR EAST

Vietnamese War. The war in Vietnam continued to be the focus of world concern, largely because of what it could develop into. The war involved directly only one major power—the United States. Apprehension centered on both the possibility of Communist China's direct involvement and the chance of participation by the Soviet Union. On several occasions in 1965, the increased United States commitment to the war heightened the apprehension, and much discussion took place as to whether the "escalation" of the war was not becom-

ing uncontrollable. These apprehensions, however, turned out to be groundless. In practice, escalation proved to be a procedure that could be controlled with some degree of precision; and to each stage of the escalation, Communist China and the Soviet Union reacted with unexpected caution and restraint.

Meanwhile, the situation in Vietnam remained largely unchanged, with the same basic factors that have been at work for the past decade. The primary change was the extent of the United States commitment, which increased as a result of a number of important policy decisions. These included: (1) selective bombing of military targets in North Vietnam; (2) increasing the number of U.S. ground troops in South Vietnam; and (3) assigning U.S. troops to combat side-by-side with Vietnamese government forces.

The first and most crucial of these decisions came on Feb. 7, 1965, when United States forces commenced air attacks on Vietcong (Communist) barracks, staging areas, and supply routes in the southern region of North Vietnam. As a result, North Vietnam could no longer be used as a sanctuary from which Vietcong guerrilla operations could be staged immune from attack. Earlier, in August 1964, retaliatory action had been taken against North Vietnam after North Vietnamese torpedo boats had attacked U.S. destroyers in the Gulf of Tonkin. However, after Feb. 7, 1965, continuous strikes resulted in an altogether new phase of U.S. participation in the war. Some of these attacks on North Vietnam were made by heavy bombers based on Guam, some 2,400 miles from the target areas—a telling demonstration of U.S. air power.

Twice during 1965, the American commitment of money and troops to aid South Vietnam in its struggle against Communist attack was increased. By the end of 1965, about 180,000 U.S. troops were involved. More than 1,350 American servicemen were killed in Vietnam during 1965; 5,300 others were wounded; and 147 were captured or reported as missing. These developments showed how shallow had been the optimism of earlier prophecies that the war was being won and that U.S. troops would soon be brought home. By the same token, they justified the views of those who earlier had insisted that if an adequate number of U.S. troops was committed, the war could be won.

By mid-1965 there were signs that the tide had turned against the Vietcong. On several occasions the Vietcong risked set battles and were severely beaten. Direct U.S. military assistance and the taste of battlefield successes gave the South Vietnamese forces a renewed feeling of confidence and hope of ultimate victory. South Vietnamese leaders reminded the people that a similar attack by Communist guerrillas had been decisively defeated in Malaya a decade before.

As the war raged on, the United States stepped up its efforts to achieve a cease-fire and a permanent peace in Vietnam. A 30-hour Christmas truce was arranged for December 24-25, and, although ground fighting was resumed thereafter, the U.S. government suspended its bombing raids on North Vietnam. President Johnson initiated a major "peace offensive," sending high-level emissaries to far-flung world capitals to sound out all possibilities of arranging a negotiated settlement. However, there was no positive response from the Vietcong, North Vietnam, or their allies, and the bombing raids were resumed on Jan. 31, 1966.

South Vietnamese Government. South Vietnam's cautious optimism about the war was reinforced by a pause in the kaleidoscopic changes of government in Saigon. The young air force officer, Nguyen Cao Ky, who was named premier on June 19, came closer than any head of government since the downfall of Ngo Dinh Diem in 1963 to providing South Vietnam with a stable regime. By the end of 1965, Premier Ky had shown an interest in curbing chronic corruption and in tackling some of the basic problems of social reform. He also seemed to have some popular appeal.

President Johnson arranged a meeting with Ky in Honolulu, Hawaii, on Feb. 6-8, 1966. The Declaration of Honolulu, resulting from this meeting, stressed U.S.-South Vietnamese cooperation toward achieving civil reforms in South Vietnam as well as military victory.

Position of Communist China. The turning of the tide of war in favor of South Vietnam and its ally, the United States, had an indirect effect on the prestige of Communist China. It also seemed to give credence to the belief that withdrawal is not the way for the United States and other anti-Communist forces to "win friends" in Asia. The Chinese had often accused the United States of being a "paper tiger," but the initiative taken by the United States in the Vietnamese war in 1965, coupled with the unusually cautious reaction of China, raised interesting speculation as to who was really the paper tiger.

The anniversary celebration on October 1 of the establishment of the Chinese Communist government, an annual affair often used as a barometer to measure Peking's international popularity, was poorly attended in 1965. There were few delegations from Africa, and none from Japan, the Philippines, Burma, Singapore, and, inauspiciously, North Vietnam and North Korea. The latter, once Peking's most reliable Asian ally, steered an increasingly independent course in 1965. Soviet Premier Aleksei N. Kosygin visited North Korea in February, and friendly relations between Pyongyang and Moscow, broken off in 1963, were restored. Economically and militarily, North Korea began to place more reliance on distant Moscow, and to depend less on nearby Peking.

Apparently recognizing the drift of its Asian allies toward the Soviet Union, Communist China increased its ideological attacks on the USSR. On several occasions, Chinese spokesmen accused the Soviet Union of collaborating with the United States to isolate China and achieve world domination.

Japan. Despite the onset of a recession, the economy of Japan achieved the world's highest rate of growth (16.3%) during the 1964-65 fiscal year. For the past several years, Japan has moved toward shipbuilding and other heavy industries and away from small-scale production. It was becoming increasingly evident that the economic progress and stability of Asia might depend to a large extent on Japan's participation in that continent's economic development.

On Oct. 16, 1965, Japan announced that nine countries of Southeast Asia—Burma, Cambodia, Indonesia, Laos, Malaysia, the Philippines, Singapore, South Vietnam, and Thailand—had been invited to attend a regional economic conference in January 1966 (later postponed to April). It was hoped that agreement would be reached on the creation of a mutual economic assistance organization.

(Continued on page 90)

DURING INDIAN-PAKISTANI CONFLICT in September, a U.S.-built Pakistani tank on its way to the front line rumbles past a horse-drawn buggy carrying civilians.

ASIA: 1965

As the war in Vietnam mounted in intensity, India and Pakistan fought a brief but bitter conflict in August and September, during which Communist China again threatened India. Indonesia hailed Singapore's secession from Malaysia in August as a victory in President Sukarno's campaign to break up the Malaysian Federation, but in Indonesia itself a bloody civil war began in October between nationalists and Communists after leftists attempted to take over control of the government.

NEAR CHINESE-INDIAN BORDER, soldiers of an Indian mountain division guard against a threatened Communist attack in September.

MALAYSIAN POLICE round up Indonesian guerrilla infiltrators whose mission was to carry out Sukarno's threat to crush Malaysia.

UPI

An augury of regional cooperation was seen in the signing on June 22 of a treaty between Japan and South Korea establishing full diplomatic relations. Korea was ruled as a colony of Japan from 1910 to 1945, and after Korean independence the relations between them remained cool. The treaty, which was effected after 14 years of intermittent negotiation, provided for substantial Japanese aid to Korea and for the settlement of outstanding Korean claims against Japan and other disputes.

Laos. Contrary to all pessimistic forecasts, 1965 turned out to be a year of relative well-being for Laos. Prince Souvanna Phouma's government showed heartening signs of political stability. To the benefit of the government, the Communists, who nominally hold four seats in the cabinet, have been boycotting cabinet meetings for the past two years. At the other end of the political spectrum, the rightist general, Phoumi Nosavan, was exiled in February after leading an abortive coup. With the support of other right-wing leaders, Souvanna Phouma won a clear victory in the general election of July. Meanwhile, the Communist Pathet Lao forces were weakened by the diversion of supplies to the Vietcong, and controlled less territory by the end of 1965 than at any time since 1961.

Cambodia. Under the adroit rule of Prince Norodom Sihanouk, Cambodia struggled to stay clear of great-power politics in Southeast Asia. Prince Sihanouk, who earlier had cut Cambodia off from U.S. aid programs, finally severed diplomatic relations with Washington on May 17, 1965. In the fall he embarked on a four-month tour of Communist China, North Korea, and Europe. Nevertheless, he allowed few foreign Communists to enter Cambodia, and the small Cambodian Communist Party was given little room for action.

Thailand. A SEATO member, Thailand proceeded in 1965 to strengthen its northeastern provinces in preparation for a possible invasion by Communists from Laos. Thai rural development teams, trained and financed by the United States, made considerable headway in building roads and developing new markets for local cash crops.

Secession of Singapore from Malaysia. One of the most disturbing events of the year in Asia was the secession of the great port-city of Singapore from Malaysia. Malaysia had come into being on Sept. 16, 1963, when the independent Federation of Malaya merged with the self-governing state of Singapore and the British colonies of North Borneo (now Sabah) and Sarawak. The new federation immediately came under attack by Indonesia, and was subjected to irredentist territorial claims by the Philippines. In spite of these external pressures, Malaysia became a relatively stable political entity, prosperous and pro-Western.

The new nation, however, was beset by simmering tensions between the Chinese, the largest racial community in the federation, and the Malays, who controlled the federal government. (Before the secession of Singapore, Chinese constituted 43% of the population of Malaysia and 75% of the population of Singapore.) The interracial rivalry came to a head when Lee Kuan Yew, the prime minister of Singapore and leader of the Chinese community in Malaysia, began to campaign for the Chinese population's having a bigger voice in the federal government. The Malays, on the other hand, considered their control of the federal government to be a prerogative guaranteed by the constitution, and were fearful that the federation might eventually come

under Chinese domination. In a desperate attempt to avoid an interracial crisis that could conceivably lead to bloodshed, and to maintain control of his own Malay supporters, Tunku Abdul Rahman, the prime minister of the federation, decided to ask Singapore to secede.

The secession of Singapore from Malaysia, announced on Aug. 9, 1965, after a meeting between Tunku Abdul Rahman and Lee Kuan Yew in Kuala Lumpur, came as a complete surprise. Nevertheless, Singapore's independence was quickly recognized by a majority of the nations of the world, and the new country was admitted to membership in the United Nations in September.

As a sovereign state, Singapore is something of a political anomaly. Nevertheless, if it can continue to earn its living by trade, it has better prospects of viability than many other new nations of the world. In Malaysia, Singapore's withdrawal necessarily opened up new speculation regarding the future of northern Borneo. Neither Sabah nor Sarawak are totally satisfied with the rule of the federal government in Kuala Lumpur.

Political Crisis in Indonesia. The question of race relations between the Chinese and the other races was one of the key issues in the abortive coup in Indonesia on Oct. 1, 1965. This coup was directed against President Sukarno and seemed to have been inspired by the Communists, even if they were not directly involved. There was little doubt that if the attempt had succeeded, the Communists would have been the principal beneficiaries.

Since the coup failed, the Indonesian Communist party became the principal loser. However, the personal authority of Sukarno also suffered, and, for the first time since Indonesia achieved independence 15 years ago, his power was curtailed. For some years, Sukarno's position had depended on maintaining a delicate balance between the army and the Indonesian Communist party—the largest Communist party in Asia, outside of China. The suppression of the coup by the army and the subsequent arrest of Communist leaders virtually removed the Communist party as a political force and placed the army in control of the government. Much popular hostility was also unleashed against the Communist party and the Indonesian Chinese population. Indonesian rioters, who had once burned American libraries and destroyed the British embassy in Djakarta, turned instead to attacking the premises of the Communist party. These events, which Peking was powerless to avert, contributed further to the decline of Chinese prestige.

However, it was too early to predict what course Indonesia would follow in the future. By late February 1966, the resilient Sukarno had recovered sufficient prestige to oust from his post of minister of defense and chief of staff of the armed forces General Nasution, the man chiefly responsible for the anti-Communist and anti-Chinese campaign that followed the abortive October 1 coup. Fourteen other strongly anti-Communist ministers were replaced, and Sukarno openly praised the Indonesian Communist party for its contributions to the nation since independence.

SEATO. The tenth meeting of the South East Asia Treaty Organization (SEATO) Council was held in London, May 3-5, 1965. All members (Australia, France, New Zealand, Pakistan, the Philippines, Thailand, the United Kingdom, and the United States) were present at the meeting, although France was represented only by an observer. The

council's final communiqué stated that "substantial assistance and reinforcement have been given during the past year by certain member governments in order to assist South Vietnam in resisting aggression from the north," and noted that SEATO members agreed "to continue and, consistent with their commitments elsewhere, to increase their assistance to South Vietnam."

Jesús M. Vargas, former secretary of defense of the Philippines, took office on July 1, 1965, as SEATO secretary general. He replaced Konthi Suphamongkhon of Thailand, whose term had expired.

SOUTH ASIA

Indo-Pakistani Conflict. Another theater of war opened during 1965 when long-smouldering ill feeling between India and Pakistan broke out into open hostilities first, in April, in the desolate Rann of Kutch region and then, in August, in Kashmir and along the Indo-Pakistani border. The fundamental issue lay in the question of whether India had sincerely accepted Pakistan's existence as an independent state. Pakistan, on the other hand, being much the smaller of the two, never felt secure from some eventual Indian attempt to terminate Pakistani independence. Pakistan's apprehension grew when the United States began to give military aid to India during the two-month Indo-Chinese war in 1962.

Pakistan was disappointed in its search for allies to bolster its position vis-à-vis India. Neither its mutual security agreement with the United States nor its membership in SEATO and CENTO (between which Pakistan forms a link, being the only Asian member of both alliances) paid off in terms of support against India. Furthermore, the recent reorientation of Pakistan's foreign policy toward a rapprochement with Peking proved equally disappointing. India rejected a Chinese ultimatum to withdraw its troops from the frontier regions of Sikkim, and China did not follow this rejection with action.

The Indo-Pakistani war dwindled into sporadic flare-ups after a cease-fire was imposed on the belligerents on September 23 by the UN Security Council. (The United States and the Soviet Union had pursued parallel policies on this issue.) Consequently the major source of friction between India and Pakistan, the Kashmir situation, reverted to the status quo that had existed for 18 years before the recent conflict. India continued to insist that Kashmir was an integral part of India, and Pakistan continued to demand that the UN resolution calling for a plebiscite be implemented.

A major step toward a lasting peace on the subcontinent was taken on Jan. 10, 1966, when President Mohammed Ayub Khan of Pakistan and Prime Minister Lal Bahadur Shastri of India signed an accord providing for troop withdrawals to positions held prior to the outbreak of fighting in Kashmir on Aug. 5, 1965. The two leaders had met in Tashkent, Soviet Asia, at the invitation of Soviet Premier Kosygin, who acted as mediator, and the accord, known as the Declaration of Tashkent, was signed just hours before Shastri's sudden death of a heart attack on Jan. 11, 1966. In the declaration, India and Pakistan pledged to observe the cease-fire line, to restore normal diplomatic and economic relations, to follow the principle of noninterference in each other's internal affairs, and to settle disputes through peaceful means. On Feb. 26, 1966, UN Secretary-General U Thant confirmed that India and Pakistan had completed the troop withdrawal as agreed upon at Tashkent.

Ceylon. In March the pro-Western United National party, which had been out of power since 1956, won a decided victory in the general election. After assuming office, the new prime minister, Dudley Senanayake, undertook to open negotiations with American and British oil companies to settle the disputes which had arisen under the former government of Mrs. Sirimavo Bandaranaike. Measures were also taken by the new government to restore the ravaged economy of the country. Although the interracial fissures between the Sinhalese and the Tamils remained a serious social problem, the political and economic situation in Ceylon appeared more hopeful than it had been at any time since 1956.

MIDDLE EAST

An unusual and welcome quiet pervaded the Middle East during 1965. Although no fundamental problems were solved, and some minor disturbances occurred, there was less serious trouble on the whole than in any recent years.

CENTO. Members of the Central Treaty Organization (CENTO)—Iran, Pakistan, Turkey, and the United Kingdom—marked the 10th anniversary of the organization's founding on February 24. The 13th session of the CENTO Council of Ministers was held in Teheran, April 7-8. CENTO's major activities in recent years have been concerned with developments in economics and communications. However, the organization was faced with more pressing matters in 1965, when the Indo-Pakistani conflict threw the future of CENTO into some doubt because neither Turkey nor Iran gave Pakistan more than verbal support in its brief struggle with India.

Yemen War Ends. The dispute between the United Arab Republic and Saudi Arabia over Yemen was resolved by a compromise on August 24, that ended the three-year Yemeni civil war in which the two major Arab states had supported opposing sides. Under the compromise, Saudi Arabia agreed to stop providing military aid to Yemeni royalist forces, and the United Arab Republic agreed to withdraw the 60,000-man force it had sent to support the republican troops. The agreement also provided for a national plebiscite in Yemen, to be held on Nov. 23, 1966, to decide the country's political future.

President Nasser's Position. Something of a retreat on the part of President Gamal Abdel Nasser of the United Arab Republic could be seen in the moderate mood prevailing at the meeting of the Arab League leaders held at Casablanca, Morocco, September 11-18. The league made its customary denunciations of Israel, but indefinitely postponed plans for joint military action against the Jewish state. A further weakening of Nasser's influence was apparent in cabinet changes in Iraq in July, when President Abdul Salaim Arif dropped pro-Nasserite ministers, and in Syria in August, when the anti-Nasser Baathist party was strengthened. However, a split in Syria's Baathist party brought victory for the leftist wing in a coup on Feb. 23, 1966.

LICK OBSERVATORY

CRATERS on the surface of the moon were photographed by Ranger 8 spacecraft from a distance of 150 miles on Feb. 20, 1965. The crater Sabine is near the center of the picture, and the crater Ritter is above it and to the left. The crater Schmidt, which has smooth, steep walls, is at the far left. Two long rills (depressions) are at the bottom right. Arrow superimposed on telescopic view of the moon (at left) indicates Ranger 8's impact point in Sea of Tranquility.

ASTRONOMY

The year 1965 was marked by advances in astronomy that considerably increased man's knowledge of the solar system but raised new questions about far-distant objects in the universe.

The moon, sun, Venus, and Mars—neighbors of earth in the solar system—were intensively observed by means of a variety of advanced techniques. Both Mars and Venus were found to be inhospitable to life. Photographs taken of Mars by the Mariner 4 spacecraft showed the planet to be much like the moon. Photographs of the moon's terrain sent back to earth by the Ranger 8 and Ranger 9 spacecraft provided important data for the United States program to land men on the moon.

Observations of distant objects in the universe opened new paths in 1965 for investigating and understanding the nature and evolution of stars, the quasi-stellar radio sources (quasars), and the quasi-stellar blue galaxies.

In October, comet Ikeya-Seki, the brightest comet since 1882, grazed the sun at a distance of only 300,000 miles and gave astronomers an unusual opportunity to study this celestial object.

Mariner 4 Voyage to Mars. In July 1965, after a difficult but outstandingly successful 7½-month flight over a total distance of 325 million miles, the Mariner 4 spacecraft provided surprising photographs of Mars. Although Mars had been regarded

as a sister planet of the earth, it proved to be more like the moon—full of craters, and desolate and dry. The 21 pictures of the surface of Mars, transmitted to earth on July 15–24 when Mariner 4 was about 134–142 million miles away, were taken at distances from Mars ranging from 10,500 to 6,118 miles. These pictures are enormously superior to any photographs taken from the earth or to any drawings made during a century of visual observations. They show no trace of "canals," seas, or oases, but they do show a pockmarked landscape full of craters formed by the impact of giant meteorites.

Scientists at the Jet Propulsion Laboratory and the California Institute of Technology, who analyzed the photographs, found 70 craters, ranging from 3 to 75 miles in diameter, in the 1 percent of the area of Mars that was photographed. From the length of shadows, they concluded that the crater rims rise a few hundred feet above the surface of Mars, and the bottoms are a few thousand feet below the surface. Some craters have central peaks and younger craters on their floor or walls.

The meteorite bombardment that produced these craters continued for a long time. Some craters are so shallow and worn that they appear to be very old. However, after the violent bombardment by meteorites or small asteroids, Mars experienced no great geological events to destroy the collision features. For example, it did not undergo the geological formations and changes that on earth

ROUTE OF MARINER 4

MARTIAN SURFACE areas (above) were photographed by Mariner 4 on July 14, 1965, at distances of 10,500 to 6,118 miles. The spacecraft took 21 pictures, of which 16 are indicated by rectangles. The planet's surface (right), depicted in the 11th photograph (area designated by the white rectangle above), is covered with craters like those on the moon. The large crater, with two small ones inside it, is about 75 miles in diameter.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

MARINER 4 made a 228-day, 325 million-mile trip to Mars, took pictures of the planet's surface, and transmitted them back to earth as it continued on its trip around the sun.

produced oceans, continents, and long, folded mountain ranges that became worn by erosion.

Unlike Mars, the earth has a dynamic, semifluid core that produces continent-lifting forces, mountain ranges atop the continents, and earthquake and volcano belts. The circulation of electric charges in this hot material also produces the earth's magnetic field, which varies as these subterranean currents change. Data from Mariner 4 showed that Mars has no dynamic core. A sensitive magnetometer on Mariner 4 showed that there was no increase in magnetic field strength as the spacecraft passed close to Mars, although the magnetometer was capable of recording a field strength 10,000 times weaker than that of the earth. Nor did analysis of the Mariner 4 data detect any evidence of trapped radiation belts around Mars. (The Van Allen radiation belts around the earth are particles trapped by the earth's magnetic field.)

Prior to Mariner 4, measurements of the Martian atmosphere, using the telescope at the Mount Wilson

Observatory, showed that the atmosphere of Mars was about 40 times as thin as that of the earth. Also, the spectra of the planet Mars showed that it lacked oxygen or water vapor, except as ice in the frozen polar caps.

The flight of Mariner 4 provided more information on the atmosphere of Mars. When the spacecraft moved behind Mars, its radio signals passed through the Martian atmosphere as they traveled toward receivers on earth. The atmosphere of Mars had only a very little effect on the radio signals. The evidence indicates that the planet has almost no atmospheric shield against bombardment by meteorites and high-energy particles from space (cosmic radiation), and that its atmosphere is even thinner than what was expected. Mars seems to be, and perhaps always has been, a dead world.

Moon Photographs. The spacecraft Ranger 8 sent back 7,137 close-up photographs of the moon before it crashed in the Sea of Tranquillity on Feb. 20, 1965. The photographs showed enormously fine detail, including long chains of elongated craters. The final frames showed craters with loose rocks on their walls, presumably impact debris. The pictures from Ranger 8 also showed a clearly defined pair of rills (long depressions in the lunar surface) in the relatively flat surface of the Sea of Tranquillity.

Ranger 9 sent back 5,814 pictures of the moon before it plunged into the crater Alphonsus on March 24. The crater, 50 miles wide, with a 3,300-foot peak at its center, probably was formed by the impact of a huge object. The successively closer pictures of Alphonsus showed that its walls are old, highly eroded by later impacts, and smoother than had been expected. On its floor are irregular rills. The smallest craters that could be seen in Alphonsus are only 30 inches across.

Before Ranger 9, there was a question as to whether Alphonsus showed volcanic activity. Darker-than-average spots on the photographs appear to be deposits of ash similar to those produced by volcanic explosions on earth. Even the rills, which contain dimplelike depressions, are partly filled with ash. However, the area near the peak of Alphonsus showed no particular evidence of any volcanic structures similar to those seen on earth.

The Soviet space probe Zond 3 transmitted excellent photographs of the far side of the moon. The pictures, taken on July 20, 1965, from a distance of about 7,000 miles, had a resolution about equal to that of the Mariner 4 pictures of Mars. They showed only a few large maria (seas), but an enormous number of large and small craters. A preliminary Soviet study indicated that there are even more craters on the far side of the moon than on the near side, as well as more mountainous areas and long chains of craters.

The Temperature of Venus. Other than Mars, Venus is the only planet in the solar system that was considered as a possibility for supporting advanced forms of life. Venus, a twin of the earth in size, has a very dense and opaque atmosphere that is approximately 40 miles thick. Infrared measurements of the temperature in the upper Venusian atmosphere (mapped in detail by Bruce C. Murray, James A. Westphal, and Robert L. Wilkey in 1965) show that the temperature is very low, ranging from -63°F. to -108°F. It is lowest near the poles, and practically the same throughout day and night. At 40 miles above the surface, the temperature apparently is determined by the circulation of heated air by winds, and not by the direct heat of the sun.

Near the top of the atmosphere it is too cold for much water vapor to exist. Spectroscopic observations had shown previously that carbon dioxide is the major component of the atmosphere, rather than oxygen or water.

High-frequency radio waves, which penetrate the Venusian cloud layer, perhaps all the way to the surface, were used in 1965 to measure the surface temperature of Venus. Barry Clark, together with Arkady Kuzmin, a Soviet scientist visiting the California Institute of Technology, found that the night side of Venus reaches a temperature of about 680°F. , and the day side may be even hotter. The poles are about 300°F. cooler than the night side.

The atmospheric pressure at the surface of Venus is probably very high, perhaps 10 to 50 times greater than that at the surface of the earth. The high temperatures in such a dense atmosphere suggest that hot, dry, dusty, high-velocity winds carry heat around the planet. The thick atmosphere traps solar radiation and raises the surface temperature far above what scientists had expected. Venus appears to have too much atmosphere to support life, and Mars has too little.

Comet. Comet Ikeya-Seki, discovered by the Japanese astronomers Kaoru Ikeya and Tsutomu Seki on Sept. 18, 1965, made a hairpin turn around the sun on October 21 at a distance of about 300,000 miles. The comet appeared to be 10 times brighter than the full moon, was visible in the daytime, and had a curved tail about 75 million miles long. The nucleus of the comet was estimated to be 50 miles in diameter, and the coma around the nucleus was estimated to be 30,000 miles across. The vaporized materials in the comet included iron, nickel, copper, sodium, calcium, and potassium, according to George Preston of the Lick Observatory. The Ikeya-Seki comet is the eighth since 1668 of the group of sun-grazing comets that have an orbital period longer than 1,000 years.

The Sun and the Stars. An important total eclipse of the sun was successfully observed in the South Pacific on May 30, 1965. Scientists in a jet plane flying in the same direction as the shadow of the moon moving across the earth were able to record data with their instruments during a total eclipse that lasted 9 minutes and 42 seconds, the longest on record. For ground observers, the total eclipse lasted only about 4 minutes.

Studies of photographs of the solar surface revealed that magnetic fields slightly stronger than average are always present in the hotter, brighter areas on the surface and above it in the region called the chromosphere. These hot areas are large, and they vary slowly in shape and size. Nearly vertical features like flames are concentrated along the bright rims of these hot areas.

The chromosphere of the sun has been studied by observing a spectral line of ionized calcium—the so-called K-emission line. Studies of stars of various ages made by Olin C. Wilson showed that the youngest stars have the strongest K-emission lines. This indicates that a star is born with a very active chromosphere, which virtually fades out in a few billion years. Other evidence of great chromospheric activity in stars was found in 1965 from studies of the strength of the absorption lines of lithium. These studies were made at the Lick Observatory by George Herbig and George Wallerstein. Lithium is easily destroyed by nuclear processes inside a star, and thus younger stars have more lithium than the sun. Some old stars, however,

MOON photographs of great detail were taken by Ranger 9 spacecraft on March 24, 1965. Ranger 9 took 5,814 pictures before it crashed into the crater Alphonsus. Target point for this spacecraft, as indicated above, was near the central peak of Alphonsus. The sequence of four pictures shows Alphonsus at distances ranging from 775 to 0.75 miles.

RANGER 9, when 775 miles from the moon, transmitted this view of craters Alphonsus (l.), Ptolemaeus (top), and Albategnius (r.). Square shows area of next picture; dot indicates point of impact.

CENTRAL PEAK of Alphonsus, 3,300 feet high, was photographed at a distance of 58 miles. Crater floor has smaller craters and rills, in an area of 28 by 24 miles. Square shows area covered in next picture.

FLOOR of the crater Alphonsus is shown in this photograph taken by Ranger 9 as it neared the impact point (circle) beside a 25-foot-wide crater. The square shows area covered by the photograph below.

SMALLEST CRATERS in last complete picture by Ranger 9 are about 2.5 feet wide. Stones half buried in surface material are barely visible. Taken at distance of 0.75 mile, picture covers area of 155 by 125 feet. Circle shows Ranger 9's impact point.

SUN-GRAZER COMET Ikeya-Seki, discovered on Sept. 18, 1965, had a tail estimated to be 75 million miles long.

still have considerable amounts of lithium, which is probably manufactured by nuclear bombardment in the magnetic fields of their chromospheres.

Observations by Hyron Spinrad of the University of California have shown that there is water vapor around very cool stars. Spinrad observed spectra with molecular bands that are strengthened when water is hot. This evidence indicates that the very cool stars are surrounded by hot clouds of steam.

Even cooler stars than those studied by Spinrad were detected in 1965 by physicists Gerry Neugebauer, Dowell Martz, and Robert B. Leighton, who used an aluminum-coated plastic mirror 62 inches in diameter to gather the infrared radiation from individual stars. The cool stars detected have temperatures of only 700°C (the surface temperature of the sun is about 5400°C). Most radiation from these stars is emitted at far infrared wavelengths.

An extensive catalog of accurately determined physical properties of very small stars, called white dwarfs, was completed in 1965 by Olin Eggen and Jesse Greenstein at Palomar Observatory. Accurate colors, temperatures, and spectral composition have been determined for 200 white dwarfs, and distances from the earth have been determined for about 50. On the average, a white dwarf has a mass about one half that of the sun, and a diameter about one fiftieth that of the sun. The average density of white dwarfs is more than one ton per cubic inch. These strange objects are a final stage in stellar evolution. Spectra of white dwarfs show that they are made of helium, carbon, and some hydrogen.

Quasars. The most exciting developments in radio astronomy in 1965 concerned the further identification and study of the quasi-stellar radio sources, called quasars. These extraordinary objects are distant, faint, point sources of radio-frequency noise. They emit more strongly at short wavelengths than

do other radio sources such as distant galaxies. But their outstanding features are their small angular size and the great red shift of the light from the starlike objects connected with the radio sources. At least 60 quasars have been identified by radio observations in England, Australia, and the United States, and by optical telescope work, largely at Palomar.

The velocity and distance of an object can be computed from measurements of the shifts in the lines of its spectrum. For objects that are moving away from earth, the spectral lines are shifted toward the red end of the spectrum; for objects that are moving toward earth, the lines are shifted toward the violet end of the spectrum.

The spectra of the starlike objects show broad, weak emission lines that are characteristic of strongly heated gases of hydrogen, carbon, oxygen, neon, magnesium, and silicon. These emission lines are shifted from their original wavelengths to longer wavelengths, that is, toward the red end of the spectrum. For the quasar 3C 9, Maarten Schmidt measured a red shift of 200%. He also found that four quasars have red shifts greater than 100%. A red shift of 100% corresponds to a radial velocity of the object of 180,000 km/sec; a red shift of 200% corresponds to a velocity of 240,000 km/sec, which is 80% of the velocity of light. It has been estimated that quasar 3C 9 (radio source 9 in the third University of Cambridge catalog) is 8.7 billion light years away from earth. (On Dec. 15, 1965, M.E. Burbidge reported finding a quasar, 0106+01, receding at 81% of the velocity of light.)

Stars with red or violet shifts indicating a velocity of a few hundred kilometers per second have been familiar for some time. Large red shifts have been associated only with very distant galaxies and the expansion of the universe. The most distant galaxy known (radio source 3C 295) had a red shift of only 46 percent. The relationship between the red shift and the distance of an object has been reliable for all remote galaxies. A question still being debated is whether quasars, in fact, have these enormous distances or whether there is some unknown cause for the red shifts. Is it possible that intense fields of gravity cause the red shifts? Greenstein and Schmidt do not think so.

Present evidence favors the interpretation that quasars are enormously distant objects of a strange new type. The Milky Way contains 200 billion stars and is 100,000 light years across. A quasar has a volume of only a few light years across, but it emits 100 times as much light as does the whole Milky Way. It is difficult to explain the great brightness of quasars in terms of ordinary sources of nuclear energy. Thus, it may be necessary to account for the great output of light from a quasar by postulating some new source of energy.

An exciting new quasar discovery was made in 1965 by W.A. Dent of the University of Michigan. He found variations in the strength of the high-frequency radio noise from 3C 273, the brightest and nearest quasar known. The variations in the brightness of this object, detected at optical wavelengths, helped to establish that it was only a few light years in diameter. The radio emission was supposed to come from a large region perhaps a thousand light years across. Dent found that the radio noise from 3C 273 increased over a three-year period, indicating that the size of the radio-emitting region of 3C 273 is very small, perhaps also only a few light years across. Dent's discovery is an important one.

Quasi-Stellar Blue Galaxies. Enormously distant superluminous objects were identified and analyzed by Allan Sandage in 1965. These objects, called quasi-stellar blue galaxies, differ from quasars in that they are not strong sources of emissions at radio frequencies. They differ from galaxies in that they are very small, in spite of their enormous brightness, and are rich in ultraviolet light.

JESSE L. GREENSTEIN

California Institute of Technology*

ATMOSPHERE RESEARCH

Among the significant developments in atmosphere research during 1965 were new findings about the formation of noctilucent clouds. For many years meteorologists have been puzzled by the very fleeting appearance of these wispy clouds at altitudes of about 48 miles. They occur during the summer at high latitudes (generally above 45°), and often have a wavelike character. There has long been speculation as to whether they are composed of dust or water vapor.

Formation of Noctilucent Clouds. Recent analyses of samples collected by rockets in the upper atmosphere over Sweden show that noctilucent clouds contain dust particles of nickle micrometeorites which seem to be enveloped in ice. By calculating the upward diffusion of water vapor from the mesosphere and the downward drift of dust from the exosphere, it has been shown that noctilucent clouds are probably formed by a unique admixture of dust and water vapor when the mesopause is unusually cold. Water vapor condenses on a dust ledge occurring at the mesopause and forms clouds which are visible at twilight.

Thunderstorm Electrification. The investigation of thunderstorm electrification is one of the most challenging problems in atmosphere research. In a thunderstorm, a negative charge apparently is brought to the top of the cloud by electrical conduction from the ionosphere and then is carried to the lower part of the cloud by downdrafts. At the same time the positive charge produced by the point discharge current flowing from the earth is carried to the upper part of the cloud by updrafts. Each of these currents has a strength of approximately 1 ampere. It is not yet known what role falling rain plays in thunderstorm electrification and whether or not the falling of charged precipitation is the dominant electrification process in most thunderstorms.

Observations of the new Icelandic volcano on the island of Surtsey indicate that lightning in the volcanic cloud is the result of the convection of charge in updrafts rather than the falling of electrified precipitation. If electrified thunderstorms are produced by the convective mechanism, one might expect that it would take longer for a cloud to become electrified where the space charge concentration is low, as in Illinois, than where the space charge concentration is high, as in New Mexico. This is indeed the case, for highly electrified thunderstorms are more frequent in New Mexico than in Illinois.

Upper-Lower Atmosphere Coupling. It has been shown that the outer regions of the earth's atmosphere—those above 100 kilometers—are largely under direct solar control and respond very quickly to changes in the sun's ultraviolet radiation and particle emissions. It is also true that in the upper stratosphere and mesosphere the seasonal tem-

perature changes are very great and are contingent on the amount of sunlight present. Because it is doubtful whether short period changes in solar emission affect this region, it is difficult to understand why any changes taking place in the outer atmosphere should lead to changes in the lower atmosphere. On the other hand, it has been shown that changes in the middle stratosphere are caused by the upward extension of large-scale effects in the troposphere.

One of the most interesting meteorological discoveries of recent years is the 26-month oscillation of the zonal wind component in the tropical stratosphere. This zonal wind cycle appears to be accompanied by a temperature oscillation and a change in the total amount of ozone present. Between latitude 16° and the equator the highest temperatures precede the west wind maximum, but in the subtropics the lowest temperatures precede the maximum westerlies.

There is evidence that the 26-month oscillation has two superposed modes: a tropical mode characterized by a vertically propagating wave, and a global mode consisting of a standing wave from a pole to the equator. The global mode appears to be characterized by the simultaneous occurrence of westerly winds, low temperatures, low ozone content, and ascending motions at all levels in the temperate and polar stratospheres.

The corresponding tropical part of the standing wave is characterized by westerly winds, high temperatures, high ozone content, and subsiding air. One half-cycle later, easterlies prevail at all heights, and the temperature and ozone phases are reversed.

One theory that seeks to explain this phenomenon, but which does not seem to be substantiated, is that the oscillation originates in the heating of the ozone layer by variable solar ultraviolet radiation for a 26-month period. Another theory that seems more probable is that the oscillation begins as a subharmonic of the annual global heating cycle, even though a 26-month cycle does not appear to be a precise subharmonic. The annual heating cycle may give rise to tidal motions, which are peculiar in that the primary oscillation occurs with the semi-diurnal harmonic period, rather than with the fundamental period.

Proton Whistlers. A new very-low-frequency phenomenon associated with the propagation of whistlers in the ionosphere has been found in VLF recordings from the Injun 3 and Alouette satellites. This phenomenon appears to be a dispersion of the original lightning electromagnetic impulse by ions (protons) in the ionosphere. Dispersion caused by electrons in the ionosphere and beyond is the origin of normally observed whistlers from the earth's surface. Satellite observations show that a proton whistler is always accompanied by an electron whistler. The electron whistler is propagated only from the base of the ionosphere to the satellite.

Stratospheric Aerosols. Two simultaneous balloon flights into the stratosphere in 1965 carried a coronascope to measure light scattering and an ion detector to measure ion concentration. The measurement revealed the stratosphere to be highly stratified with thin layers of ion concentration 30 meters thick, separated by ion-free layers 300 meters thick. (See also WEATHER.)

ATOMIC ENERGY

The development of nuclear power for industrial use, water desalting, and scientific research made progress in 1965, both in the United States and in other countries. However, weapons work continued to be the largest single item in the U.S. Atomic Energy Commission's budget, and France and Communist China continued to strengthen their nuclear warfare potentials.

PEACEFUL USES OF ATOMIC ENERGY

Nuclear power plants were under construction or in the planning stage in all sections of the United States. France, Britain, and the USSR were also taking steps to increase their nuclear power capacities. Dual-purpose power and water-desalting projects were underway or planned in the U.S. Southwest, Israel, and the USSR. At Brookhaven National Laboratory, on Long Island, a new research reactor was brought into operation.

U.S. Power Installations. Public utilities in the United States have committed themselves to install nuclear facilities having a capacity of 2,500 megawatts of electricity (Mwe). This commitment represents more than 2.5 times the total installed U.S. nuclear power capacity at the end of 1965.

Florida Power and Light Company was among the companies planning large nuclear facilities. Its Turkey Key plant, under construction in 1965, is to start with a coal-fired capacity of 1,000 Mwe and increase the capacity to 3,000 Mwe by utilizing nuclear reactors. The first reactor will have a capacity in the 800- to 1,000-Mwe range and is scheduled to supply power in 1970.

The impressive record of the Yankee Atomic reactor, which went into operation in Massachusetts at the end of 1960, has led two other New England

power groups to plan the installation of nuclear facilities. A group consisting of the Connecticut Light and Power Company, the Hartford Electric Light Company, and Western Massachusetts Electric Company, has announced plans for a 600-Mwe installation at Millston Point, Conn. The Central Vermont Public Service Company and the Green Mountain Power Co. are planning an installation in Vermont in the 350- to 450-Mwe range. The Connecticut and Vermont reactors are planned to begin operation in 1969.

France. The use of nuclear power in France has been expanding at a rapid rate. Since 1960, France has installed nuclear generating facilities totaling about 1,000 Mwe, which is comparable with installed U.S. capacity. For the next five-year period (1965-70), the government plans to build at least one gas-graphite 500-Mwe reactor each year. This corresponds to about one quarter of the estimated total new power facilities that will be installed in France during this period.

Britain. By far the greatest installed nuclear power capacity, a total of nearly 3,000 Mwe, exists in Britain. The combination of low capital costs for construction of new plants and the high cost of conventional fuels has made the use of nuclear power economic. Britain, like France and the United States, is rapidly becoming more dependent on nuclear power. The British government plans to install an additional 5,000 Mwe of nuclear power in the first half of the 1970's.

USSR. Articles in Soviet newspapers during 1965 revealed the existence of plans for building a chain of large atomic energy stations in European Russia. They would relieve the problem of transporting coal, oil, and natural gas to the western USSR from Siberia, where a disproportionate share of Russia's natural fuel resources are located. The main centers of Soviet industry and population are concentrated west of the Urals.

The Soviet Union announced that it has started construction of a BN-350 fast reactor, first described in 1958 at the Second Geneva Conference on the Peaceful Uses of Atomic Energy. The reactor will be used for both power and desalting purposes. The BN-350 is now under construction at Shevchenko, a town on the eastern shore of the Caspian Sea. Upon completion in 1968, the reactor is expected to power a desalting plant that will supply 10 million gallons of water per day.

Desalinization Projects. Acute water shortages in the United States and elsewhere led to very serious study of the economics of nuclear desalinization in 1965. The United States sponsored its first international symposium on water desalinization in Washington, D.C., October 3-9; 63 countries were represented. The purposes of this conference were to study means for alleviating domestic water shortages and to improve arid regions in developing countries. A highlight of the meeting was the signing of an agreement between the United States and Mexico to explore together the feasibility of a large-scale nuclear power and desalting plant to serve the region embracing the border areas of California, Arizona, Sonora, and Baja California. The International Atomic Energy Agency also was a party to the agreement.

In 1965 the United States was actively engaged in a desalinization project at Pelican Point, Calif. The project was at a preliminary design stage following a favorable feasibility study carried out in 1964 by the Bechtel Corporation for the Metropolitan Water District of Southern California (MWD). The preliminary design was being done by Bechtel for MWD in cooperation with the AEC and the Office of Saline Water (OSW) of the Department of the Interior. Besides the desalting facility to be built and operated by MWD, the project would supply power from reactors built and operated by utility companies.

This dual-purpose concept is attractive because the heat energy at the exit of the electricity-producing turbine generators can be used to evaporate fresh water from brine. The plant would supply 1,800 Mwe and 150 million gallons of water per day (mgd). The overall estimated cost of installation is \$300 million. The preliminary estimates indicate that the cost of electric power will be three-tenths of a cent per kilowatt-hour, and the cost of water 22 cents per 1,000 gallons. Comparable costs of conventional fuels are estimated at four-tenths of a cent per kilowatt-hour and 28 cents per 1,000 gallons.

The timing and funding for the project will involve decisions by the government, private industry, and municipal utilities. The utilities involved are Southern California Edison, San Diego Gas and Electric, and the Los Angeles Department of Water and Power. They estimate that the need for power will require the plant to be in operation by 1971. This schedule allows ample time for the construction and operation of an evaporator module prototype to be set up by OSW at San Diego Gas and Electric's South Bay plant site.

A proposed desalting project in Israel was studied by two U.S. companies: Kaiser Engineering (nuclear aspects) and Catalytic Construction Company (desalting aspects). Their joint report calls for a plant to produce 200 Mwe and 100 mgd. Provisions in the design allow steam to be bypassed to the desalting facility when power demand is low, or for the generating plant to operate at full capacity when

the water plant is shut down. The specifications call for a 1,250-Mwe light water reactor and a four-stage 25-mgd desalting plant. The initial operation is scheduled for 1971 and is contingent on the development of the same OSW evaporator module prototype as will be used for the Pelican Point plant. (See also CHEMISTRY; WATER SUPPLY.)

U.S. ATOMIC ENERGY COMMISSION

The U.S. Congress approved a \$2.55 billion budget for AEC operations for the 1966 fiscal year. It cut some \$350 million from the previous year's budget. The cut was not across the board, but reflected a reevaluation of priorities.

Projects. The project most seriously affected by the budget reduction was SNAP 50, which was cut from a requested \$22 million to \$12 million. The Congressional Joint Committee on Atomic Energy (JCAE) stated that the project was "in the classification of advanced technology . . . with no presently identifiable project-type objectives." The SNAP 50 project is concerned with developing a nuclear propulsion reactor for space vehicles and is under contract to the Connecticut Advanced Nuclear Engineering Laboratory of Pratt & Whitney Company. Because of the sharp reduction in funds, the project will be shifted from Pratt & Whitney to AEC's Livermore (Calif.) Radiation Laboratory.

The JCAE added \$1.1 million to an AEC request for \$1.4 million to develop a nuclear-powered merchant ship. Here the JCAE found the commission lagging in what it considered a promising field.

Research. On Oct. 31, 1965, scientists and engineers at Brookhaven National Laboratory brought their high-flux beam research reactor (HFBR) critical, that is, to its first self-sustaining nuclear chain reaction. The reactor was designed to provide the world's highest beam flux of neutrons. ("Flux" refers to the number of neutrons passing through a given area in a given length of time.) The reactor will be used primarily for research into the nature and structure of matter.

The HFBR is designed to operate at 40 Mw and is cooled, moderated, and surrounded by heavy water. It is fueled with 28 uranium-235 fuel ele-

WORLD'S LARGEST HEAVY WATER REACTOR, completed at Karlsruhe Nuclear Research Center in West Germany, is inaugurated on November 22 during ceremony held in the turbine hall (below, left). The reactor boiler is shown at the right.

PICTORIAL PARADE PHOTOS

A PROPOSED 200-BEV PROTON ACCELERATOR would be attached to Brookhaven National Laboratory's existing 33-Bev accelerator (1), which would inject high-energy protons into the new machine (2). They would be further accelerated up to 200 Bev and then shot into target areas (3) for experimentation. Protons are accelerated to smash the nuclei of atoms. The more they are accelerated, the more particles result from the collision. These particles are then analyzed, thus providing new knowledge of the atom.

ADAPTED FROM THE NEW YORK TIMES

COMPARATIVE SIZES of existing and proposed proton accelerators are shown above, superimposed on a map of Manhattan. The smallest circle (1) represents the 33-Bev machine (842 feet in diameter), the largest now in existence. The middle circle (2) shows the size of the proposed 200-Bev machine (4,528 feet in diameter). The largest circle (3) represents a proposed 1,000-Bev accelerator, which would have a diameter of 16,000 feet.

ments housed in the lower spherical portion of the reactor vessel. The entire reactor system is housed in a hemispherical containment building with an inside diameter of 176 feet. While the reactor is in operation, the building is maintained at a slight negative pressure to ensure that any air leakage is inward rather than outward. Access to the building is provided by an airlock system.

The first work on the HFBR began in 1956 with physics calculations by Brookhaven scientists to determine what reactor system would best meet the research needs of the laboratory. Preliminary engineering design was started in 1960, and construction was begun in the fall of 1961. The capital cost for construction of the HFBR is about \$12.5 million.

Operations. The operating budget for physical research was up \$25 million from the previous year, to \$239 million, but the capital budget (plant and equipment) was down \$64 million. The operating expense budget for civilian power reactors was reduced by \$1 million. For recent programs, the JCAE urged "continual vigilance" by the AEC to "phase the government out of further developments or improvements of types of reactors which are commercially available." As in previous years, weapons work amounted to nearly half the total AEC budget.

Licensing Reform. Because of the increasing knowledge gained from operating nuclear power facilities and the increasing demand for new facilities to supply urban centers, the AEC asked the nuclear power industry to review the reactor licensing process. The average time consumed in processing construction permit applications has been one year. The industry believes that this time could be reduced to six months without sacrificing any safety controls. Its main recommendations were (1) that the primary safety analysis be done by the staff of AEC's director of regulation, and (2) that the three-man Atomic Safety and Licensing Boards confine themselves to accepting or rejecting this analysis and not attempt an independent technical review of reactor safety. A further recommendation was that the Advisory Committee of Reactor Safeguards (ACRS) should be relieved of its statutory mandate to review all license applications, while retaining the right to look into any project, and that it should spend most of its time on reactor safety.

High-Energy Physics Report. AEC's release of the study report *Policy for National Action in the Field of High-Energy Physics* touched off a debate in the scientific-political community. The disagreement concerned the proper government support of research in high-energy physics. The report, made at the request of the Congressional Joint Committee on Atomic Energy, recommended that funds be allotted for the design and construction of a 200 billion electron volt (Bev) accelerator starting in July 1966, and an 800-Bev machine building project beginning in July 1970. This two-step approach to obtaining higher-energy nuclear projectiles had been recommended in 1963 by a scientific committee headed by Professor Norman Ramsey of Harvard University.

The AEC report estimated that the 200-Bev machine would cost about \$300 million to build and about \$65 million a year to operate. The study recommended that a site be chosen to provide the greatest overall advantage to the government and the high-energy physics program. It specifically stated that the location of the group of scientists and engineers engaged in designing the machine should not necessarily determine the eventual construction site. As a result of this report, AEC solicited invitations from all interested parties for appropriate sites for the new machine.

SPACE AND MILITARY APPLICATIONS

The uses of nuclear devices for space and military applications increased rapidly in 1965.

SNAP Reactors. On April 3, SNAP 10-A became the first nuclear reactor to be orbited in space (in the Snapshot satellite). It supplied 565 watts of electric power, at 28.5 volts DC, by means of a thermoelectric generator. The energy source was a small nuclear reactor cooled by liquid sodium-potassium and operated at a power level of 41 kw. The reactor proper was about the size of a 5-gallon tank and weighed 210 pounds. The entire package was just under 1,000 pounds. The system was designed to operate in space for one year. However, after a perfect launch and reactor startup by command signal from the ground, the reactor suddenly shut itself down after operating for 43 days.

A promising nuclear method for obtaining auxiliary power for space applications is the use of radio-

active isotopes as a source of power. SNAP 10-A's power-to-weight ratio was 0.5 watt per pound, compared with 2 watts per pound for isotope generators in the 100-watt power range. The first isotopic generators used the beta-emitting strontium-90 as a power source. However, they were not well suited for space application because of their low power density, which indicates that large weights must be used. The isotopic generators now used for space application contain curium-242 or plutonium-238; the latter appears to provide the best present-day source of energy.

A device powered by plutonium-238 was used in the Navy's Transit satellite, launched in 1964. It failed to go into orbit, causing great concern at that time over the 17,000 curies of plutonium-238 contained in the source. Had it fallen back to earth, it might have created a major radioactive hazard. Results of air-sampling studies released in 1965 showed that the plutonium burned up at reentry, at an altitude of about 120,000 feet, and that it is descending on a large area of the earth's surface over a period of years, but is not creating an appreciable hazard. The first American astronauts to land on the moon will carry 50-watt plutonium-238 SNAP's that will be used to supply power for remote lunar experiments.

A third method for obtaining auxiliary power is to couple a small reactor to a turbogenerator. This was the system used for SNAP 50, the project that was downgraded by Congress in 1965.

Nuclear-Powered Rocket Engines. The use of nuclear-powered engines for space propulsion falls into two classes: (1) to provide large initial thrust for short periods (on takeoff); and (2) to provide minute thrusts over long periods of time for space travel. Both projects are being actively pursued.

The Rover reactor rocket project made a comeback after having nearly been shut down in 1963 because of reactor core-material failure at very high temperatures. The rocket, which uses hydrogen heated in the reactor as a propellant, has been tested on the ground for 16.5 minutes at the full design power of 1,000 Mw. The specifications require that the reactor operate for one hour. Upon successful development, Rover rockets are expected to be used in systems developing 250,000 pounds of

thrust, as upper stages of large chemical boosters.

Low-thrust rockets will be needed for maneuvering space vehicles once they escape the gravitational fields of the planets. Thrust of about 0.005 to 0.5 pound is useful for these purposes and can be supplied from the emission of alpha or beta rays from radioactive samples. A low-thrust rocket system using polonium as a source was proposed and developed by the former Space Technology Laboratory under the project name of Poodle. A unit was tested in a simulated space environment and produced a thrust of about 0.003 pound over a 65-hour period. (See also SPACE EXPLORATION.)

Nuclear Weapons. The United States and USSR continued underground testing of nuclear weapons throughout 1965. The United States exploded an 80-kiloton hydrogen bomb in the Aleutian Islands (Alaska) on October 29 to produce data for monitoring any future ban on underground testing. A Soviet underground nuclear explosion that took place on October 8 in Central Asia was detected at the new U.S. seismic station in Montana, dedicated on October 12. The station had been built under Project Vela to help solve the problem of detecting underground nuclear blasts and distinguishing them from earthquakes. These technical problems stand in the way of negotiating an effective complete ban on nuclear tests.

The two atomic powers that refused to sign the limited nuclear test ban treaty of 1963 made progress in 1965 in developing their small nuclear forces. Communist China exploded its second uranium-fueled atomic bomb on May 14. The AEC said the bomb was somewhat larger than the 20-kiloton device tested by the Chinese in 1964. France announced on July 12 that it had put an improved atomic bomb into production. The new bomb is believed to be smaller but more powerful than the 40-kiloton device produced since 1963 for delivery by Mirage 4 jet bombers.

On December 2, 1965, the U.S. aircraft carrier *Enterprise* became the first nuclear-powered ship to enter combat. The carrier launched air strikes against targets in South Vietnam.

Department of Physics
Brookhaven National Laboratory

NUCLEAR-POWERED THRUST for space vehicles is provided by SNAP 10-A, which was successfully tested in 700-mile-high orbit in 1965. Ground-test model (center) is flanked by control console and testing equipment. Reactor containing 10.5 pounds of uranium-235 is in small tank at top. SNAP's "skirt" consists of 2,880 pellets of germanium-silicon, which are heated by atomic fission and generate up to 565 watts of electricity. SNAP 10-A, launched on April 3, 1965, was designed to orbit earth for a period of 3,500 years, by which time its U-235 will have decayed.

MISSILES AND ROCKETS

AUSTRALIAN NEWS & INFORMATION BUREAU

NEW GOVERNOR-GENERAL of Australia, Lord Casey (portrait at left), was sworn in at ceremonies on the steps of the Federal Parliament House in Canberra on Sept. 22, 1965. Standing directly behind Lord Casey are (l. to r.) Lady Casey, Prime Minister Robert Menzies, and Dame Pattie Menzies.

AUSTRALIA

The Australian government took stronger action in support of South Vietnam and Malaysia during 1965. Australia made greater use of its combat troops in both countries, and also stepped up other types of aid. Increased defense spending led to higher taxation and a worsening of the unfavorable balance of overseas trade that had developed in late 1964.

Involvement in Vietnam. In February 1965 the Australian government announced that it would send an additional 17 military instructors to Vietnam, increasing its total there to 100. Other aid included a shipload of corrugated iron, an engineering team to build a water supply system and roads at Bien Hoa, and 100,000 Vietnamese language textbooks for use in primary schools. Australia supported the United States policy of bombing targets in North Vietnam, and Prime Minister Sir Robert Menzies warned there could be no negotiation without assurance of a genuine cease-fire and the ending of subversion in South Vietnam.

In May, Menzies stated that Australia had agreed to South Vietnam's request for more military aid and would send an 800-man infantry battalion.

Three months later the government decided to send 350 additional supporting troops, comprising artillery, engineer, armored, signal, light aircraft, and supply groups. While in London for the June meeting of Commonwealth prime ministers, Menzies declared, "We are at war, make no mistake about it." He disagreed with several Commonwealth prime ministers on the possibility of negotiating an end to the war in Vietnam.

Involvement in Malaysia. Following Indonesia's withdrawal from the United Nations on January 21, Malaysians and Australians feared that Indonesia would step up its campaign to "crush Malaysia." The Australian minister for defense, Shane D. Paltridge, toured Malaysia to assess the need for increased aid. In February he announced that Australia would send an infantry battalion to serve with Malaysian and British units in Malaysian Borneo against the threat of an Indonesian attack. As a conciliatory gesture, the Australian minister for external affairs, Paul M.C. Hasluck, noted that Indonesia had stated that it still supported United Nations principles and added that Australia would continue a limited program of aid to Indonesia. Prime Minister Menzies said that Indonesia appeared to be interested in damaging Malaysian morale

AUSTRALIA · Information Highlights

Area: 2,971,081 square miles.

Population: 11,313,000 (Mar. 31, 1965 est.).

Chief Cities (1963 est. for metropolitan areas): Canberra, the capital (1964 municipal census), 77,466; Sydney, 2,256,110; Melbourne, 2,003,100; Brisbane, 649,500; Adelaide, 600,200; Perth, 445,000; Newcastle, 215,950.

Government: Governor General—Lord Richard Gardiner Casey (appointed July 29, 1965). Prime Minister—Sir Robert Gordon Menzies (took office Dec. 19, 1949; also was prime minister in 1939–41). **Parliament**—House of Representatives, 124 members (party seating, 1965: Liberal and Country coalition, 72; Labour, 52); Senate, 60 members (party seating, 1965: Liberal and Country coalition, 30; Labour, 27; Democratic Labour, 2; independent, 1).

Religious Faiths: Protestants, 67% of population; Roman Catholics, 21%; Jews, 1%; others, 11%.

Education: Literacy rate, 99% of population (excluding aborigines). Total school enrollment (1961)—2,379,086 (primary, 1,586,009; secondary, 601,692; technical, 103,600; higher, 87,785).

Finance (1964): Revenues, \$2,482,816,000; expenditures, \$3,097,920,000; monetary units (1966), Australian pound

(0.4464 pound equals U.S.\$1); Australian dollar (0.8929 dollar equals U.S.\$1).

Gross National Product (1964): \$19,219,200,000.

National Income: (1964): \$15,659,840; average annual income per person, \$1,390.

Economic Indexes: Industrial production (1963), 131 (1958=100); agricultural production (1964), 138 (1956–57=100); cost of living (1964), 111 (1958=100).

Manufacturing (metric tons, 1964): Crude steel, 5,083,000; cement, 3,626,000; sugar, 1,982,000; meat, 1,711,200; wheat flour, 1,512,000; aluminum, 80,292; wool yarn, 23,640.

Crops (metric tons, 1964–65 crop year): Wool, greasy (1963), 808,300 (ranks 1st among world producers); wheat, 9,525,000 (world rank, 6th); oats, 1,415,000 (world rank, 7th); barley, 907,000; grapes, 569,000; potatoes, 483,000; citrus fruits, 229,000; maize, 173,000.

Minerals (metric tons, 1964): Iron ore, 6,309,000 (ranks 17th among world producers); gypsum, 780,000 (world rank, 12th); salt, 592,000 (world rank, 20th); lead, 380,881 (world rank, 1st); zinc, 351,399 (world rank, 4th); silver, 18,275,000 troy ounces (world rank, 6th); gold, 963,300 troy ounces (world rank, 5th); bituminous coal, 27,794,000; lignite, 19,330,000.

Foreign Trade (1964): Exports, \$3,040,000,000 (chief exports: wool, \$1,006,000,000; wheat, \$408,000,000); imports, \$3,315,000,000 (chief imports, 1963: nonelectrical machinery, \$371,000,000; transport equipment, \$294,000,000; textile yarn and fabrics, \$236,000,000). **Chief trading partners** (1963): Britain (took 19% of exports, supplied 30% of imports); U.S. (took 12% of exports, supplied 21% of imports); Japan (took 16% of exports, supplied 6% of imports).

Transportation: Roads (1964), 535,036 miles (70,362 paved); motor vehicles (1964), 3,378,074 (automobiles, 2,546,533); railways (1963), 25,497 miles; merchant vessels (1964) 103 (515,000 gross registered tons); principal airports, Adelaide, Brisbane, Canberra, Melbourne, Perth, Sydney.

Communications: Telephones (1964): 2,522,522; television stations (1964), 47; television sets (1964), 2,000,000; radios (1963), 2,238,000; newspapers (1962), 58 (daily circulation, 4,011,000).

rather than starting an all-out war. He pointed out that Australia was "willing to be friendly" but was pledged to support Malaysia's "territorial integrity and independence."

After the failure of the attempted coup to oust Indonesian President Sukarno (September 30–October 1), Australia's Foreign Minister Hasluck welcomed the "growing anti-Communist sentiment in Indonesia." With the support of the leader of the Labour opposition, he expressed the hope that Indonesia would concentrate on solving its domestic problems and promised Australian assistance for Indonesia's economic development.

Defense Program. Australia's military commitments to Malaysia and South Vietnam convinced the government of the need to build up defenses, and the first peacetime conscription for overseas military service went into effect in January, when registration began. Starting in July, men who had reached the age of 20 during the first six months of 1965 were called up on the basis of a random drawing of birth dates. A total of 4,200 men were inducted during the last six months of 1965, and the government announced that 2,100 men would be drafted during each quarter of 1966.

As part of its 3-year defense program (1965–67), the government concluded an agreement with the United States to purchase military equipment costing about \$360,000,000. The package included 3 missile-equipped destroyers, 24 F-111-A aircraft, and a wide range of other aircraft and advanced weapons. Other military expansion included the construction of additional training facilities for the enlarged army and the purchase of 110 supersonic Mirage jet fighters built in Australia.

Economy. Although the gross national product showed a 9% increase in fiscal year 1965, as it had in the previous fiscal year, there were signs of difficulty. Economic problems included a 22% increase in imports, a 5.4% drop in exports, a tightening of both domestic and overseas markets for government borrowing, and a balance of payments deficit 15 times above that of the preceding year. Meat exports to the United States fell by 60%. Wool production reached a record high, but an extended drought was expected to reduce total production for the marketing year 1965–66.

Broken Hill Proprietary, one of the private companies reporting record profits, opened a new steelworks in South Australia. Japanese steel companies agreed to purchase more than \$4 billion in iron ore from Western Australian companies over an extended period of years, but shipments were not to begin until after 1965.

In March the Reserve Bank of Australia introduced two measures to tighten credit. Interest rates on overdrafts and deposits with the trading banks were increased by 0.25 to 0.50%, and there were similar increases for deposits and loans of the savings banks.

Government Finance. The federal budget for 1965–66 provided for expenditures more than 10% greater than in 1964–65, including a 27% boost for defense and a 12.6% raise in payments to the states. The budget anticipates a small surplus based on added revenues from a 2.5% increase in personal income tax rates and substantial tax raises on gasoline, alcoholic beverages, and tobacco. The Labour opposition argued that the budget imposed tax increases only on wage earners, provided meager social service gains, and failed to deal with the problems of excessive imports and reliance on foreign capital.

Decimal Currency. The government announced new details of the change to a decimal currency system, scheduled to go into effect on "C-day," Feb. 14, 1966. Banks were to close for four days, starting February 9, to allow time for converting their operations to the new system. All government and banking operations were to have made the change by C-day, but private businesses have up to two years to adopt the new system. Both old and new currency will circulate during the two-year period.

The Decimal Currency Board announced that 600,000,000 new coins will be available by C-day. In addition, 22 new postage stamps will be introduced, and a change in the basic stamp price from 5 pence to 4 cents will reduce the cost by 0.2 pence. The new dollar, equivalent in value to the present Australian 10 shilling note, is worth U.S.\$1.12 at the 1965 exchange rate.

Elections. The Australian High Court ordered a recount of votes cast in Victoria for the federal Senate seat in the election held on Dec. 5, 1964. The recount, tallied on Feb. 9, 1965, gave the undecided seat to the Democratic Labour party. As a result, the Menzies government lost its majority in the new Senate, which convened on Aug. 17, 1965. The new lineup in the Senate was 30 seats for the Liberal and Country party coalition, 27 for the Australian Labour party, 2 for the Democratic Labour party, and 1 independent.

In state elections held in 1965, the Liberal and Country party coalition was reelected to power in Western Australia, and the same coalition defeated the Labour party in New South Wales for the first time in 24 years. However, in South Australia, the Labour party defeated the Liberal and Country League for the first time in 32 years.

New Governor-General. On July 29, 1965, Queen Elizabeth II approved the appointment of Lord Richard Gardiner Casey as the 16th governor-general of Australia. He replaced Viscount de L'Isle, governor-general from 1961, who retired in May.

AUSTRALIAN COMBAT TROOPS are greeted by Vietnamese girls on June 16, after their arrival in Saigon to join the allied war effort against the Vietcong insurgents.

WIDE WORLD

AUSTRIAN INFORMATION SERVICE, NEW YORK, N.Y.

AUSTRIAN STUDENTS honor the 600th anniversary of the founding of the University of Vienna in May 1965. In its long history the university has graduated more than half a million students and has awarded more than 72,000 doctorates. The enrollment is more than 12,000, one third coming from outside Austria.

AUSTRIA

The election of a new president, following the death of President Adolf Schärf, the resignation of the cabinet, and the celebration of the 10th anniversary of the signing of the Austrian State Treaty were the most important political events of 1965 in Austria. There were also other notable anniversaries to commemorate.

Presidential Election. Scholarly Adolf Schärf (1890–1965), president of Austria since 1957, died on February 28. When the election for his successor took place on May 23, Franz Jonas, the Socialist mayor of Vienna, defeated former Chancellor Alfons Gorbach, of the conservative People's party, by 2,324,474 votes (50.7%) to 2,260,992 (49.3%); 94,095 ballots (2.1%) were invalid. The new president was sworn into office on June 9, for a six-year term.

Death of Leopold Figl. Death claimed another leading Austrian statesman when Leopold Figl (1902–65) died on May 9. He had been chancellor of Austria from 1945 to 1953, foreign minister from 1953 to 1959, president of Parliament from 1952 to 1962, and governor of Lower Austria from 1962 to 1965. He was largely responsible for the conclusion

of negotiations with the Soviet Union that made possible the Austrian State Treaty on May 15, 1955. (For biographical sketches of Schärf and Figl, see *NECROLOGY*.)

Anniversaries. The official ceremonies in Belvedere Castle on May 15 in commemoration of the 10th anniversary of the State Treaty of 1955 were attended by the foreign ministers of the USSR, Britain, France, and the United States, representing their predecessors who signed the treaty in that palace. Austria also marked with appropriate ceremonies and exhibitions the 20th anniversary of the Republic (April 20), the 600th anniversary of the founding of the University of Vienna (May 9–15), and the 150th anniversary of the signing of the Treaty of Vienna June 9.

Political Affairs. On March 31, Parliament approved a revision of the Criminal Code designed to permit further prosecution of war criminals. This was a reversion to Austrian law as it existed before 1950, when the crime of murder did not come under the statute of limitations.

On October 22 the cabinet of Chancellor Joseph Klaus, a coalition of Socialists and People's party members, resigned because of a disagreement over

Foreign Trade (1964): Exports, \$1,446,000,000 (chief exports, 1963: iron and steel, \$194,453,000; conifer lumber, \$115,000,000; textile yarn and fabrics, \$107,109,000; cattle, \$38,768,000); imports, \$1,863,000,000 (chief imports, 1963: passenger cars, \$101,511,000; coal, \$66,193,000; iron and steel, \$49,378,000). Chief trading partners (1963): West Germany (took 26% of exports, supplied 41% of imports); Italy (took 17% of exports, supplied 8% of imports); Switzerland (took 7% of exports, supplied 5% of imports).

Transportation: Roads (1964), 20,645 miles (11,739 paved); motor vehicles (1964), 733,323 (automobiles, 641,606); railways (1963), 4,005 miles; national airline, Austrian Air Lines; principal airports, Graz, Innsbruck, Klagenfurt, Linz, Salzburg, Vienna.

Communications: Telephones (1964): 866,275; television stations (1964), 14; television sets (1964), 485,000; radios (1963), 2,110,000; newspapers (1963), 37 (daily circulation, 1,751,000).

FRANZ JONAS, a Socialist, was elected president of Austria on May 23, 1965, defeating the candidate of the conservative People's party in a campaign that introduced American political styles to the country. Both candidates were photographed more and traveled farther than in any preceding contest. The conservative, Alfons Gorbach, campaigned by helicopter, but Jonas did not fly and covered less ground than his opponent. In a victory speech he told supporters, "Now you can sleep quietly for the next six years."

Jonas was born in a working-class district of Vienna on Oct. 4, 1899. After serving in the Austrian Army in World War I, he became a linotype operator by trade and a Socialist in politics. By 1932 he had become secretary of a section of the Socialist party in Vienna. Following World War II he entered city politics and continued to advance in the Socialist party. He first served as mayor of a district of Vienna, then held posts in the city government, and was mayor and provincial governor of Vienna from 1951 to 1965.

PHOTO SIMONIS

the next year's budget. President Jonas announced that elections would be held in the spring of 1966. Chancellor Klaus was asked to head a caretaker government until the time of the elections.

Economic Development. The Austrian economy showed vigorous expansion in 1964, with the fastest rate of growth since 1960. Agriculture produced record yields in practically all crops. The gross national product was nominally up 9.8%, but after being adjusted to changes in price levels the increase was 6%, as compared with 4.4% in 1963. Preliminary quarterly figures indicated a slower rise in the gross national product for 1965.

The monthly average of employed workers stood at 2,363,000, an increase of 21,700 over the 1963 average. Austria has the highest percentage of employed women in western Europe—36 per 100, as compared with 23 per 100 in Italy and 33 per 100 in West Germany. The government set an admission quota of 45,000 foreign workers in 1965, compared with 36,000 in 1964.

Foreign Affairs. Austria's prolonged negotiations (March 18–June 25) with the European Economic Community (EEC) led to a rapprochement of views but no concrete results. Austria's suggestion that she be permitted to retain membership in the European Free Trade Association (EFTA) while joining EEC was not accepted by the Common Market states. In 1964, 59% of Austria's imports came from EEC states and 48% of her exports went to them.

Differences with Italy over South Tyrol remained quiescent during the year. Rumania ratified on March 29 an agreement to pay Austria \$1.5 million as settlement for goods of Austrian nationals confiscated by Rumania during and after World War II. A five-year Austro-Rumanian trade agreement, effective Jan. 1, 1966, calls for mutual minimum increases of 25% in the volume of goods exchanged. Agreements primarily covering legal matters, signed with Hungary on April 9, were expected to improve relations between the countries.

Austria has contributed medical and police detachments to the UN peace-keeping force in Cyprus. On March 8, Austria joined the Development Assistance Committee of OECD, the Organization for Economic Cooperation and Development. An important part of the Austrian aid program consists of contributions to multilateral agencies. However, Austria has undertaken its own limited projects in some 20 countries. In addition, an ambitious educational effort provides that nearly 5,000 students from underdeveloped countries can study at Austrian universities.

E.C. HELMREICH

Thomas Brackett Reed Professor of History and Political Science, Bowdoin College

AUTOMATION

Computer technology's most spectacular achievement in 1965 was the transmission of close-up photographs of Mars by the space vehicle, Mariner 4. Still pictures of the planet were scanned by Mariner 4's small computer unit and broken into 64 shades of gray. Each shade was numbered for transmission in sequence across 135 million miles of space to tracking stations on earth. Transmission of the first picture took 8 hours, and 21 pictures were transmitted over a period of 9 days. After being received, the numbers were fed into other computers and converted again into the various gray shades to reconstitute a picture, in much the same way that tiny dots form a picture in a halftone engraving. (See also SPACE EXPLORATION.)

Compressing the Circuitry. Such striking developments as the photographing of Mars were furthered by advances in microminiaturization, a technique for compressing electronic circuitry into very small spaces. IBM's new 360 computer system utilizes tiny transistors to provide the necessary integrated circuitry. As microelectronics permits complete electronic functions to be performed by a small module or package, calculating devices that might require from 4,000 to 5,000 conventional components can be built with only 40 to 50 metal oxide semiconductors. Small memory cells developed during the year enabled computers to solve different problems at the same time. Memory cells are able to store as many as 40 million items.

Proposed New Applications. It was evident that the extraordinary uses to which computers could be put required an equally extraordinary technology. Army scientists were seeking adaptive computers that would distinguish a dud from a warhead. Such devices would draw on a wide range of "experience" in solving problems, in effect "learning" how to meet new situations.

Other devices were being developed to read handwriting and handprinting, bringing closer the time when computers, without human supervision, would scan income tax returns or appraise weather maps for forecasting. Typewriter devices hooked into computers would allow typists to retrieve data from a computer's memory to change a word or an entire paragraph in previously prepared documents without having to retype the page. The automobile industry was experimenting with computer-generated video displays to speed up the design cycle for new cars.

Industrial process controls represent perhaps the most important area for the expansion of computer technology. While there are now only about 500 process control computers in existence, equipment manufacturers expect that some 4,000 will have

been installed by 1970. The RAND Corporation, a nonprofit, private corporation that conducts studies for many government agencies, predicted a tenfold increase in capital investment in these devices during the decade from 1970 to 1980. Process control computers are used in iron foundries, electric generating stations, textile finishing plants, and oil and chemical refineries. The steel industry, thus far somewhat hesitant to use the new control mechanisms, has begun to install process control computers, making it possible to integrate basic oxygen furnaces, continuous casting, and automatic rolling mills.

Not only does a control computer increase efficiency, but it is able to put together information speedily enough to correct production line vagaries before they develop. Several digital control systems might be linked to a central data processing computer to yield inventory and marketing information that might be quickly related to production data.

Rising Investment. Investment in automated equipment has continued to grow, and in 1965 it registered an estimated 12% increase over 1964. Total investment was valued at about \$10 billion, out of \$48 billion in total outlays on plant and equipment. Data processors accounted for more than \$1 billion, electronic control devices for \$350 million, and process control computers for \$125 million. The remaining \$8.5 billion was spent on machine tools, materials handling equipment, instrumentation, motors, rectifiers, and other electrical devices, and pneumatic and hydraulic servomechanisms and other control machines.

Meeting the Challenge of Automation. Although continued growth in the economy in 1965 provided jobs to offset those lost to automation, job expansion occurred mainly in areas to which blue collar workers could adapt with difficulty—state and local government, services, and specialized occupations. Experts in business, labor, and government were hopeful that adjustments could be made without too much hardship. However, agreement was lacking on what were the real effects of automation, as evidenced by the views expressed at a national conference on automation sponsored by the American Bankers Association in San Francisco in March 1965. Thomas J. Watson, Jr., head of International Business Machines, warned at the conference that while automation was proceeding at "express train speed," its social and economic consequences remained at best unknown and at worst entirely controversial.

A good deal of recent federal legislation on manpower and training has sought to counteract what are thought to be the effects of automation. Government interest began with the 1955 hearings on automation by the Joint Economic Committee, which warned that its impact would have to be watched carefully. In 1962 the President's Committee on Labor-Management Policy issued a statement echoing the earlier concern. The Area Redevelopment Act of 1961 provided loans and grants to communities affected by technological change. In 1965 a new law provided more than \$1 billion in aid to the 11-state Appalachian region. Active manpower policies and improvement of state employment services were undertaken to match men and jobs.

AUTOMOBILE RACING. See SPORTS.

CHEVROLET offered 50 models in 1966, including the Caprice Custom and the Chevelle Super Sport 396 (top).

OLDSMOBILE TORONADO, with the only U.S. front-wheel drive, keeps rear of chassis free of power-train components.

AUTOMOBILES

The United States automobile industry accelerated its production pace in the 1965 model year, to manufacture a record 8,850,213 passenger cars. This total exceeded by nearly one million units the previous peak of 7,880,845 attained in the 1964 model year. For the 1966 model selling season that began at the end of September 1965, domestic manufacturers offered a postwar record number of 364 passenger models—21 more than in the 1965 season.

1965* MODEL PRODUCTION

The unsurpassed consumer demand for new cars led to a 12.3% year-to-year rise in 1965 model production, compared with a 6.1% rise for 1964 models. The increase in automobile production was achieved despite a six-week strike in General Motors plants and a four-week strike in Ford Motor Co. plants in 1964, soon after 1965 model output began.

The output of 1965 models was divided as follows among the four major U.S. builders: *General Motors,*

FORD'S MUSTANG (left) kept up fast sales pace in 1965; Falcon (right) shows Mustang styling influence.

FORD station wagons introduced a tailgate that either can be let down conventionally, or swung open like a door.

IMPERIAL, Chrysler Corporation's car in the top price field, presented a distinctive styling in its rear bumper.

AMBASSADOR DPL HARDTOP (left), an all-new American Motors model with a crisp roof line, and the Dodge Dart GT convertible (right) presented a sporty look.

4,560,061 (51.5% of total output); Ford Motor Company, 2,451,207 (27.7%); Chrysler Corporation, 1,441,198 (16.3%); and American Motors, 391,336 (4.4%). In addition, Checker Motors built 6,381 cars in the same period. Studebaker built no cars in the United States during 1965. Its assembly headquarters were moved to Hamilton, Ont., in December 1963.

General Motors' share of production of the 1965 models was slightly lower than its 54.1% of the 1964 models, partly as a result of the strike, but also because the company offered no direct competition to the Ford Mustang, which scored the biggest gain of any model. The compact, sporty Mustang soared from 121,538 in 1964 (1.5% of the industry total for its first year in production) to 559,460 in 1965 (6.3% of the total). Only the regular Chevrolet and Ford series outproduced Mustang in the 1965 model year.

The higher-priced intermediate and full-size 1965 models gained increased shares of retail sales. Except for the Mustang, the sale of compacts slipped. Chevrolet's Chevy II, Ford's Falcon and Fairlane,

Plymouth's Valiant, and Rambler's American suffered sharp volume declines.

Gains among the costliest models within lines were particularly impressive for Rambler's Ambassador, Plymouth's Fury, Dodge's Polara, and Mercury's Montclair and Park Lane. Other big gains were registered by three of General Motors' enlarged intermediate models—Buick Special, Oldsmobile F-85, and Pontiac Tempest. At the very top of the 1965 model price ladder, Cadillac put out 181,435 cars, surpassing the combined total of its four principal competitors—Buick Riviera, Ford Thunderbird, Imperial, and Lincoln. Lincoln gained in production, to 40,180, but the others declined, to 74,972 for Thunderbird, 34,586 for Riviera, and 18,399 for Imperial.

THE 1966 MODELS

General Motors offered a total of 171 models for the 1966 model year; Chrysler, 87; Ford, 80, and American Motors, 26. Within the model lineup, the major trend was an increase in the number of intermediate offerings at the expense of compacts. For instance, the Mercury Comet was lengthened to intermediate size.

Styling. Raised or "hippy" rear fenders, first introduced on the 1962 Pontiac Grand Prix, spread throughout all models in subsequent years and finally became standard in 1966. There was also a movement toward fastback design on specialty sports models.

The most unusual new offering for 1966—the front-wheel-drive Oldsmobile Toronado—was a true fastback. The Toronado featured Italian design lines. Its front-wheel drive, in which the drive mechanism is housed with the engine at the front of the car, had not been available on an American-make automobile since the Cord of the mid-1930's. Front-wheel drive has been offered, however, on numerous European makes, including Citroën, Saab, Lancia, and Taunus. General Motors held the distinction of having the only American-made cars with a front engine and front transmission (Toronado), and with a rear engine and rear transmission (Corvair). Other newly introduced U.S. fastback cars included American's Marlin, the Plymouth Barracuda, and a model of the Mustang. Volkswagen also added a fastback to its 1966 offerings in the United States.

Prices. The ability of U.S. car manufacturers to absorb higher labor and materials costs and still record peak profits suffered mild setbacks as the time came to price the 1966 models, and new-car prices were boosted by from \$20 to \$89 per model on most Big Three volume cars. New auto and steel labor contracts negotiated in the 1965-66 period were taken into account, but what necessitated most—although not all—of the increased amounts was the addition of six so-called safety items as standard equipment on 1966 models. The industry decided to make these items standard equipment at extra cost after Senate hearings in July 1965 highlighted charges that American-made cars were lagging in passenger safety. Items made standard and built into the price structure of U.S. cars included padded dashboards and visors, backup lights, outside rear-view mirrors, windshield washers, two-speed windshield wipers, and rear seat belts. Ford also added a four-way emergency flasher.

By California law, 1966 models also were required to carry an exhaust-control device to reduce air pollution.

Meanwhile, the federal government began reducing the former 10% excise levy on new cars. The rate dropped to 7% in July 1965 and to 6% in January 1966.

FOREIGN CARS

Imported-car sales in the United States for the first seven months of 1965 increased to 306,780, from 273,999 in the comparable 1964 period. Volkswagen accounted for virtually the entire increase. Its U.S. registrations in the seven-month period rose from 174,306 to 206,178. In July 1965, for the first time in nearly six years, monthly import-car sales exceeded the 50,000 mark, reaching 51,993. Of these, 35,526 were Volkswagens.

In second place for January-July 1965 sales was MG, followed by Triumph, Volvo, Opel, Renault, Simca, Datsun, Mercedes-Benz, and Rootes. The only volume gainers over 1964 in this "top ten" group were the Opel, sold by General Motors, and the Chrysler-marketed Simca. By the end of 1965, Chrysler had bought a 45% stock interest in the Rootes Group in Britain.

Worldwide in 1964, General Motors and its subsidiaries took 28.3% of the motor vehicle market; Ford, 17.9%; Chrysler, 8.4%; Volkswagen, 6.1%; Fiat, 4.3%; British Motor, 3.9%; Renault, 2.3%; Citroën, 2.2%; American Motors, 2.1%; Simca, 1.3%; and Peugeot, 1.3%. In 1964, for the first time, more than half of the world's new cars were built outside the United States and Canada.

BACTERIOLOGY

During 1965 an estimated 14,000 articles on bacteriology (microbiology) were published. A few of the year's important advances are described here.

Immunology. New vaccines for several human and animal diseases were developed. One was a multiple vaccine for four childhood diseases (whooping cough, poliomyelitis, diphtheria, and tetanus). The first vaccine for control of transmissible gastroenteritis in swine was put on the market, marking the culmination of a 19-year struggle to find a way to control the disease, which kills more than 1 million hogs annually.

Many theories have been advanced to explain how antibodies are formed by animals and man. Most antibodies are recognized as typical proteins (globulins). In 1965 sufficient evidence accumulated to support the "template theory" of antibody formation, because it is reconcilable with present views on genetic coding and protein synthesis.

Virology. The common cold has long been thought to be transmitted by a virus, but the virus could not be cultivated by known methods. In 1965 a common-cold virus was isolated and grown in tissue culture prepared from the windpipe of a human fetus.

Research to establish the causative agent of infectious hepatitis continued. Several strains of a virus were isolated from patients, and the accidental laboratory infections that resulted showed typical clinical symptoms of the disease. From these cases the known virus was isolated again.

Adenoviruses cause a feverish disease in human beings and malignant tumors in rodents. The true structure of one of the viruses was described in 1964. Earlier electron micrographs had shown the virus to be a regular icosahedron, with 20 triangular surfaces and 12 corners. More recent pictures show that the 20 surfaces are made up of 252 subunits, and that at each of the 12 corners the units have a long flexible tail with a knob in its end. The virus uses the knobbed tail to pierce the wall of the host cell it infects. The host-cell antibodies must specifically destroy the knobs before the virus can be inhibited.

Many viruses that induce malignant tumors, especially in fowl and animals, have been found. Work is being done on these viruses to learn how they convert normal host cells to neoplastic cells which then develop independently.

Food. It has been found that the cuticle, shell, and shell membrane of the egg can support the growth of bacteria. This is of interest in understanding how bacteria enter eggs, and it explains how eggs may contaminate other foods. Several kinds of commercially packaged foods, such as cake and bread mixes, were found to contain bacteria, some capable of causing spoilage and intestinal diseases.

In some countries increased interest is being shown in growing algae (especially *Chlorella*) for human and animal food. It is possible to harvest 10 to 15 tons of *Chlorella* per acre, compared with 1.8 tons of rice or 0.5 tons of soybean. The nutrient value and vitamin content of *Chlorella* are several times as great as those of soybean or rice.

Type E botulism, caused by eating contaminated smoked fish, has stimulated inquiries into many aspects of the collection and processing of fish. The investigations of this disease include some research on the characteristics of the disease-producing organism, *Clostridium botulinum*. There has been an increase in the number of food poisoning cases

MULTIPLE VACCINE for four childhood diseases (diphtheria, tetanus, poliomyelitis, and whooping cough) is injected into rabbits' ears by technician to test its effects.

caused by milk products which contain enterotoxin elaborated by staphylococci. The greater incidence of staphylococci in milk is attributed to acquired tolerance of the organisms for antibiotics used to treat mastitis in cattle.

Industrial. Microorganisms play an important role in the production of several pure chemicals besides antibiotics. The output of itaconic acid made by mold fermentation was increased with the building of two new plants. The acid is used widely in making synthetic fibers and resins.

Several steroid hormones were produced for the first time by using microorganisms. For example, estrone and 19-norsteroids were synthesized from cholesterol.

BALTIMORE

For seven weeks in the spring of 1965, the news in Baltimore (1965 est. pop., 933,390) was "no news" because of a strike that closed all the city's daily newspapers.

Newspaper Strike. On April 17, members of the American Newspaper Guild, demanding higher wage scales and a union shop agreement, struck Baltimore's three Sun papers—*The Sun*, *The Evening Sun*, and *The Sunday Sun*. On April 20 the city's other daily paper, *The News American*, closed its doors to its employees in support of the *Sun*. The regional office

of the National Labor Relations Board ruled on May 6 that *The News American* closing constituted an illegal lockout. The *Sun* papers and *The News American* resumed publication on June 3, after the *Sun* management and the Guild agreed on a 3-man board of arbitration to settle outstanding issues.

Antipoverty Program. Dr. Melvin J. Humphrey resigned as executive director of Baltimore's antipoverty program on June 29, after reported disagreements with Morton Macht, chairman of the commission that oversees the program. Active cooperation with the federal antipoverty program was begun by the city in 1965, but the establishment of neighborhood centers was delayed until poverty workers made better contacts with the poor.

Housing. Mayor Theodore R. McKeldin (Republican, elected May 7, 1963) supported the federal government's Housing and Urban Development Act of 1965, which enables the city to rent private housing and make it available to families eligible for public housing. A proposed ordinance to ban discrimination in housing sales and rentals was voted down by the 20-member city council.

New Transit System Proposed. A \$292 million transit system that would combine rapid rail transit, subways, and express bus facilities was endorsed by the Metropolitan Transit Authority. The proposed system would require about 160 rapid transit cars and 900 buses to serve an estimated 460,000 passengers daily by 1995.

Law Enforcement. Law enforcement provided a continuing problem for the city in 1965. A stepped-up police recruiting program was 202 recruits short of its goal by early fall.

Public Finance. Financial problems troubled Baltimore officials in 1965. The city requested \$9 million in state funds to help finance expanding services in parks and recreation areas and assist in keeping vital statistics.

Baltimore's 1965 city budget was \$381,114,759 for current and capital expenditures. The property tax rate was \$4.45 per \$100 of assessed valuation.

Economy. Mayor McKeldin announced that a proposed bond issue of \$225,000,000 for the development of the inner harbor of the city would be ready for city council action by the spring of 1966. The city's harbor, a principal source of Baltimore's economic strength, had 5,367 ship arrivals in 1964.

The cost-of-living index in 1964 was 107.9 (1957-59=100).

Baltimore's leading industries, in terms of value added by manufacture, are primary metals, transportation and equipment, and food products.

MAURICE E. O'DONNELL

University of Maryland*

BANKING

The Federal Reserve banks, the central banking system of the United States, continued the policy of maintaining moderately easy credit and stability of interest rates in almost all of 1965, the fifth year of sustained economic expansion. On December 5, however, the Federal Reserve Board—an independent agency—increased the discount rate to 4.5% from 4% on loans by Reserve banks to member banks. The board announced that it had acted “to reinforce efforts to maintain price stability and thus to foster balance in the economy's continued growth,” but President Johnson said he regretted “any action that raises the cost of credit.”

¹ Includes 13,785 commercial banks and 505 mutual savings banks as of Jan. 1, 1965. Source: Board of Governors of the Federal Reserve System.

During 1965 the substantial increase in total U.S. production gave rise to increasing credit demands, which were met by a large increase in commercial bank credit, particularly business loans. Nevertheless, a firmer policy of supplying reserves to facilitate the credit increase was followed in 1965 than in 1964. Also, some interest rates were slightly higher in 1965 than in December 1964.

Federal Reserve Policies. The 12 regional Federal Reserve banks facilitated the increase in commercial bank credit mainly through open-market purchases of U.S. government securities, thereby expanding the reserves of the commercial banks. The Reserve banks' holdings of U.S. government securities increased greatly in 1965, especially in the first half of the year, and at the end of September they were about \$2.1 billion greater than at the end of 1964.

Partially as a result of these open-market purchases, there was an appreciable increase in the total reserves of the member banks. Member banks are the main commercial banks that own the stock of Federal Reserve banks and are controlled directly by the Federal Reserve. The amount of required reserves of member banks, measured as a percentage of the deposit liabilities of each, increased about the same as total reserves. Thus, total reserves of member banks in excess of required reserves averaged about \$377 million in the first three quarters of the year, as compared with \$410 million in the second half of 1964. Many member banks, however, borrowed for short periods from the Reserve banks to meet their reserve requirements. Beginning in March 1965, the member banks as a whole operated consistently with net borrowed reserves—an indication of a firmer Federal Reserve policy.

The discount rate had been increased from 3.5 to 4% in November 1964 to restrain short-term capital outflows attracted by higher rates abroad. Largely because of the continued capital outflow and loss of monetary gold reserves by the United States in 1965, Congress in March removed the requirement that the Federal Reserve banks must hold gold certificates equal to 25% of their deposit liabilities; however, the same requirement was retained for Federal Reserve notes. This change enabled the Reserve banks to avoid contracting Reserve credit and deposit liabilities. No changes were made in 1965 in the reserve requirement of the member banks.

Interest Rates. The interest rates of some commercial banks showed little change in 1965, but the

rates of others rose slightly in the first three quarters of the year, following a general advance in 1964. The open-market yield on 3-month Treasury bills rose from 3.84 to 3.93% early in the year, declined to 3.8% at midyear, and averaged about the same in the third quarter as in December 1964. Yields on other types of short-term paper increased slightly in the same period.

The rates of leading commercial banks on prime loans—short-term loans to the bank's biggest customers having the highest credit rating—remained at 4½%. Long-term interest rates changed very little in the first three quarters of the year over those of December 1964. The average yields showed this pattern: on Federal Housing Administration mortgages, practically no change; on U.S. government bonds and corporate bonds, only fractionally higher; and on state and local government bonds, slightly higher.

Loans and Investments. Commercial bank credit—loans and investments of all commercial banks, of which member banks account for about 85%—again increased substantially in 1965. The increase, based on data seasonally adjusted and excluding interbank loans, was appreciably higher each month, except for a decline in July due to reduced investments. The level in September was about \$18.9 billion above the year-end total in 1964. Loans, the major part of commercial bank credit, accounted for practically all of the increase. The total investments of commercial banks remained about the same. Their holdings of U.S. government securities (mostly bills) declined about \$5.2 billion, and their holdings of other securities (mostly state and local government bonds) rose about \$5.0 billion.

Total loans of commercial banks increased steadily. In September the amount was about \$19.1 billion above that of December 1964—an increase substantially greater than in the corresponding period of 1964. Some indication of the changing pattern of loans was provided by the weekly-reporting member banks, consisting of about 350 member banks in 100 leading cities that provide more than half the total commercial bank credit. In the first three quarters of 1965, their business loans (commercial and industrial), the largest component in commercial bank loans, increased 13.3%; real estate loans increased 9.5%; and loans to individuals, mostly for consumption purposes, increased 7.7%.

Deposits and Currency. The money supply, consisting of demand deposits and currency outside banks (that is, held by businesses and individuals), increased moderately, in the first three quarters of 1965. The total, on a seasonally adjusted basis, amounted to \$4.6 billion, as compared with \$5.1 billion in the corresponding period of 1964. Demand deposits, comprising on the average about 80% of this active money supply, accounted for 71% of the increase. In the same period, the annual rate of turnover of demand deposits rose slightly, indicating a more intensive use of the supply. This moderate increase in the money supply and the substantial increase in commercial bank credit occurred in an expanding economy that experienced only a slight increase in the average level of prices. (See *COST OF LIVING*.)

Time and savings deposits increased \$17.6 billion in the first three quarters of 1965, or slightly more than in the corresponding 1964 period. About 85% of the increase was accounted for by commercial banks, which held 73% of such deposits. Their time and savings deposits increased \$15.1 billion, and

those of mutual savings banks rose \$2.5 billion. These commercial bank deposits, which have grown steadily for many years and have become an important source of commercial bank funds, are now larger than their demand deposits.

BAPTIST CHURCHES

Baptists are the largest single Protestant church in the United States. *The Yearbook of American Churches* for 1965 lists 29 autonomous Baptist bodies, whose membership represents about one third of all American Protestants. The Southern Baptist Convention is the largest Baptist group, followed by the National Baptist Convention, U.S.A., Inc., the National Baptist Convention of America, and the American Baptist Convention.

American Baptist Convention. The American Baptist Convention (formerly the Northern Baptist Convention) represents 6,119 churches in 45 states. The Convention, with national offices at Valley Forge, Pa., is affiliated with the Baptist World Alliance, the National Council of the Churches of Christ in the U.S.A., and the World Council of Churches.

At the convention's annual meeting, held in San Francisco, Calif., in May 1965, Robert G. Torbet, dean of the Central Baptist Theological Seminary, Kansas City, Kans., was elected president for 1965-66.

The convention conducts missionary and benevolent work and Christian education in the United States, Africa, Asia, and Latin America through 6 national societies and boards, 37 state conventions, and 13 city societies. This work is supported by contributions from churches to the American Baptist Mission Budget (\$12,772,150 in 1966) representing the interests of all agencies, plus about \$6,900,000 from other sources. In addition, a World Mission Campaign is projected for 1966-68 to raise \$20,-000,000 for mission work.

EDWIN H. TULLER

General Secretary, American Baptist Convention

Southern Baptist Convention. The Southern Baptist Convention is the largest Baptist body in the United States, with a total of 33,388 churches in 50 states in 1964. Wayne Dehoney was reelected president at the 1965 convention, held in Dallas, Texas.

Seventy-two Southern Baptist educational institutions reported a 1964-65 enrollment of 90,510 and endowments of \$113,044,688. Six seminaries—at Louisville, Ky.; New Orleans, La.; Fort Worth, Texas; Mill Valley, Calif.; Wake Forest, N.C.; and Kansas City, Mo.—enrolled 5,428 students. The American Baptist Theological Seminary for Negroes, at Nashville, Tenn., had 64 students.

The convention's 28 children's homes cared for 4,492 children and owned property valued at \$37,-084,906. The denomination also supported 1,901 foreign missionaries and 2,372 home missionaries. The annuity board reported 35,693 members, with assets of \$135 million.

The convention's executive committee has its office in Nashville, Tenn. The Baptist Sunday School Board, also in Nashville, published and distributed 53 million quarterlies in 1965.

BARUCH, Bernard Mannes

American financier, philanthropist, and adviser to presidents: b. Camden, S.C., Aug. 19, 1870; d. New York, N.Y., June 20, 1965.

As an adviser to several presidents, a public official, and a self-made multimillionaire, Bernard Baruch reflected the temper of the American scene for half a century. A sounding board and spokesman for unformulated public opinion, Baruch, the legendary "park bench statesman," often put into words what the average American thought and felt but did not have the opportunity to say. He was, by turns, a Wall Street tycoon, a Wilsonian idealist, a reluctant New Dealer, and an Eisenhower Democrat. A man whose fame and influence were considerable, Baruch, in his determination to remain behind the scenes and avoid political risks, also forfeited many of the rewards of public service.

Entering public life in 1916 during the administration of President Woodrow Wilson, the financier mobilized American industry in World War I as chairman of the War Industries Board. His last major national service was in 1946 when President Harry S. Truman named him to present to the United Nations the U.S. plan for control of atomic energy.

Early Life. Bernard Baruch was the second son of Dr. Simon Baruch, a surgeon born in Posen, East

KAPLAN - GETTY IMAGES

UPI

UPI

AS PRESIDENTIAL ADVISER, Baruch (above, right) served every president from Woodrow Wilson (seated, center) to John F. Kennedy. Baruch's post was chairman of the War Industries Board. At top left is Herbert Hoover.

IN WORLD WAR II, Baruch assisted President Franklin D. Roosevelt by heading a fact-finding commission on the conservation of essential rubber.

Prussia, who had served with the Confederate forces under Gen. Robert E. Lee, and of Belle (Wolfe) Baruch, of Winnsboro, S.C., whose American heritage reached back to colonial days. The family moved to New York in 1881, and Baruch graduated from the City College of New York in 1889. In 1897 he married Annie Griffen, who died in 1938. They had three children: Belle Wilcox Baruch, who died in 1964; Renée (Mrs. H. Robert Samstag); and Bernard M. Baruch, Jr.

Baruch started out in Wall Street as a runner earning \$3 a week. He had amassed his first million dollars by the time he was 30, and by his mid-30's he had \$1 million for every year of his age. He was a member of the legendary "Waldorf crowd," a group of financiers who frequented a bar in the old Waldorf-Astoria Hotel in New York City. Trained in speculation by such masters as Thomas Fortune Ryan and James R. Keene, Baruch took part in the development of vast industrial complexes.

Adviser to Wilson. A Democrat, Baruch attracted the attention of his fellow Southerner, President Woodrow Wilson. In 1916, Wilson appointed Baruch (whom he nicknamed Dr. Facts) to the Advisory Commission of the Council of National Defense, and made him chairman of the Commission on Raw Materials, Minerals, and Metals. Later, President Wilson put him in charge of all Allied purchasing. In

March 1919, Wilson appointed him chairman of the War Industries Board. Baruch later rejected Wilson's offer to make him secretary of the treasury, although he accompanied the president to the Paris Peace Conference. As an economic adviser to the Peace Commission, a member of the Supreme Economic Council, and an American delegate dealing with the economics and reparations clauses of the peace treaty, Baruch frequently sat in at secret meetings of the Big Four—Orlando, Wilson, Lloyd George, and Clemenceau.

Later Government Service. Baruch had few official responsibilities in the 1920's. Presidents Coolidge and Hoover used him to help get support from reluctant Southern Democrats for Republican programs. In the 1930's he turned down President Franklin D. Roosevelt's offer of an ambassadorship. He also rejected the job of war mobilization director in 1943. However, after James F. Byrnes accepted the latter post, Baruch assisted him, and also headed special fact-finding commissions for the president on the conservation of rubber and on postwar demobilization.

Celebrated Friendships. An intriguing mixture of sophistication and guilelessness, of Southern charm and American bluntness, Baruch enjoyed friendships that included Francis Cardinal Spellman and showman Billy Rose, and that bridged the years from "Diamond Jim" Brady to President John F. Kennedy. He was a lifelong friend of Sir Winston Churchill, whom he first met at the Paris Peace Conference in 1919. As prime minister, Churchill stayed at Baruch's New York home during Churchill's 1953 semiofficial meeting with President-elect Dwight D. Eisenhower.

Baruch once quipped, "I like anyone who's at the top of his profession," yet his gift for friendship also embraced the humble and the unknown. No one valued his public image more than Baruch, but he declined a medal for his public services on the grounds that his advice was so seldom taken.

Last Years. His later career was climaxed by his appointment as U.S. delegate to the UN Atomic Energy Commission, before which he flung down the simple challenge: "We are here to choose between the quick and the dead." Although it was vetoed by the Soviet Union, the Baruch plan for the control of atomic energy remained the official U.S. policy until the USSR developed its own atomic bomb.

Baruch was a talented amateur boxer in his youth and an avid hunter and swimmer into his 90's. He always maintained that old age was 15 years older than he was. He died on June 20, 1965, leaving the bulk of his great fortune to his alma mater, the City College of New York, and for medical research.

Books by Baruch: *The Making of the Reparation and Economic Sections of the Treaty* (New York and London 1920); *American Industry in the War*, ed. by Richard H. Hippelheuser (New York 1941); *A Philosophy for Our Time* (New York 1954); *Baruch: My Own Story* (New York 1957); *Baruch: The Public Years* (New York 1960).

Biographies: Field, Carter, *Bernard Baruch, Park Bench Statesman* (New York 1944); White, William L., *Bernard Baruch, Portrait of a Citizen* (New York 1950); Rosenbloom, Morris, *Peace Through Strength: Bernard Baruch and a Blueprint for Security* (New York 1953); Coit, Margaret L., *Mr. Baruch* (Boston 1957).

FUNERAL OF QUEEN ELIZABETH, grandmother of Belgium's King Baudouin I, is held in Brussels on November 30.

BELGIUM

Belgium was without an official government for more than two months following the general election on May 23, 1965. In the election, the conservative Party of Liberty and Progress gained 20 seats in the Chamber of Deputies for a total of 48. The plurality of the Christian Socialists (Catholic party) dropped from 96 to 77 seats, and of the Socialist party (labor), from 84 to 64. Together, the Christian Socialists and the Socialist party still held majorities in both houses. However, Premier Théo Lefèvre interpreted the loss of seats by his coalition Christian Socialist-Socialist government as a rebuke, and resigned on May 24.

New Government. At the request of King Baudouin,

Premier Lefèvre and his cabinet stayed on in a caretaker capacity, but they were without real policy-making power. Pierre Harmel, a Christian Socialist, was asked to form a cabinet. After the Party of Liberty and Progress refused to join a three-party coalition with the Christian Socialist and Socialist parties, which are solidly supported by the two great labor union blocs, Premier Harmel finally formed a cabinet on July 27. The new cabinet consisted of 15 Christian Socialist and 12 Socialist members.

Language Controversy. Premier Harmel, an experienced cabinet official, formerly headed a group studying Belgium's most pressing domestic problem: the tension between the French-speaking Walloons and the Flemish-speaking Flemings. The Walloons traditionally dominated the political and economic life of the country, but the Flemings have become the numerically larger group and the Walloons' economic position has declined. Bitterness over the various use of French and Flemish in the government and in the schools had increased tension to the point of bloody clashes in recent years. A linguistic law passed in 1963 drew a line across Belgium, dividing it into two major language areas, with the Brussels area designated as bilingual. The law was intended as a compromise to suit both groups and to resolve the conflict. Many observers, however, interpreted the results of the May election as indicating sharp disapproval of the linguistic law, since extremists of both the Flemish and Walloon groups gained seats.

In his first program announcement devoted exclusively to domestic matters, Premier Harmel called for mutual understanding and moderation between the two communities. A Permanent Parliamentary Commission was appointed representing all parties in Parliament to cooperate with the government in drawing up proposed constitutional changes to solve the problem. A solution was to be sought within the present governmental framework through increased cultural and administrative autonomy for both regions, rather than through a federal system, as demanded by the extremists.

Chief Cities (1961 commune pop.): Brussels, the capital, 170,489; Antwerp, 253,295; Ghent, 157,811; Liège, 153,240; Schaerbeek, 117,180.

Government: King—Baudouin I (b. 1930; acceded 1951). Premier—Pierre Harmel (took office July 28, 1965). **Parliament**—Chamber of Deputies, 212 members; party seating (1965)—Christian Socialists, 77; Socialists, 64; Liberty and Progressive, 48; others, 23. Senate, 178 members.

Religious Faiths: Roman Catholics, 89% of population; Protestants, 6%; others, 1%.

Education: Total school enrollment (1962)—1,080,169 (primary, 725,475; secondary, 78,169; teacher-training, 8,345; technical, 222,518; higher, 45,662).

Finance (1964 est.): Revenues, \$295,318,000,000; expenditures, \$326,284,000,000; public debt (1963), \$892,104,000,000;

monetary unit, franc (50 francs par value equal U.S.\$1). **Gross National Product** (1964): \$15,360,000,000.

National Income (1963): \$11,020,000,000; average annual income per person, \$1,186.

Economic Indexes (1964): Industrial production, 140 (1958=100); agricultural production, 122 (1956-57=100); cost of living, 111 (1958=100).

Manufacturing (metric tons, 1964): Crude steel, 8,736,000; cement (1964), 5,846,000; wheat flour, 769,200; meat, 515,000; cotton yarn, 94,320; wool yarn, 62,280; butter, 50,400.

Crops (metric tons, 1964): Sugar beets, 3,300,000 (ranks 14th among world producers); oats, 401,000 (world rank, 18th); rye, 136,000 (world rank, 18th); potatoes, 1,755,000; wheat, 843,000; barley, 494,000; linseed, 25,000.

Minerals (metric tons, 1964): Anthracite coal (1963), 5,986,000 (ranks 8th among world producers); kaolin (1962), 208,602 (world rank, 8th); lime, 2,298,000; iron ore, 61,000.

Foreign Trade (including Luxembourg, 1964): Exports, \$5,590,000,000 (chief exports, 1963: iron and steel, \$882,912,000; textile yarn, fabrics, \$506,424,000; nonelectrical machinery, \$298,906,000; petroleum products, \$155,990,000); imports, \$5,901,000,000 (chief imports, 1963: nonelectrical machinery, \$507,274,000; transport equipment, \$483,048,000; textile yarn, fabrics \$231,476,000). **Chief trading partners** (1963): West Germany (took 19% of exports, supplied 19% of imports); Netherlands (took 23% of exports, supplied 15% of imports); France (took 15% of imports, supplied 15% of imports).

Transportation: Roads (1964), 58,036 miles (47,473 paved); motor vehicles (1964), 1,407,800 (automobiles, 1,176,000); railways (1963), 2,871 miles; merchant vessels (1964), 79 (734,000 gross registered tons); national airline, Sabena; principal airport—Brussels.

Communications: Telephones (1964): 1,370,848; television stations (1964): 15; television sets (1964), 1,390,000; radios (1963), 3,049,000; newspapers (1961), 47 (daily circulation, 2,623,000).

The language problem has already injected itself into external affairs. Some 300 Belgian families contended before the European Court of Human Rights that their rights were violated by Belgium's linguistic laws, which deny them the privilege of selecting the language medium for instruction of their children. Belgium's acceptance of the jurisdiction of the European Court of Human Rights is to expire in 1966. However, if Belgium renews acceptance of the court's jurisdiction, and if the court decides that the linguistic laws are a violation of basic human rights, the Fleming-Walloon dispute probably will become an even greater problem.

Economy. In 1965 the Belgian economy began to show signs of a slowdown in its rate of growth. Export volume was affected adversely by the pressure of barriers raised by larger countries. Belgian wages were no longer among the highest in Europe. In mid-1965, on the advice of the European Economic Community Commission, the government relaxed its economic restraints by means of antideflationary measures, including the abolishment of credit restrictions.

Foreign capital investments continued to be welcomed, particularly in the less prosperous southern part of the country. Southern Belgium suffered economic setbacks as the result of the closing of several high-cost coal-mining operations. Among the foreign investors were General Motors, which began construction of a \$100 million automotive manufacturing and assembly plant in Antwerp, and Caterpillar Tractor, which planned a large plant in southern Belgium.

BIOCHEMISTRY

Biochemistry and the closely allied field of molecular biology continue to give fascinating new information about life processes. This information, which is derived by ingenious biological approaches, combined with the quantitative techniques of chemistry and physics, may have far more implications for man's future than even space exploration. Particularly noteworthy has been the impact on biochemical research of the use of isotopes and of advances in physical instrumentation, electronics, and computation.

Energy Transduction. Continued probing has produced more information about the methods by which cells trap oxidative energy or light energy for use in metabolic syntheses. Observations by Lars Ernster and Britton Chance showed that the mitochondria, the powerhouses of the cell, can carry out energy-linked reduction and other processes without requiring phosphorylation.

Similar studies of the way plants capture energy by photosynthesis demonstrated two distinct pigment systems. The systems are responsible for producing the light-induced electron flow, which generates the

reducing power, and adenosine triphosphate (ATP), which is needed for overall photosynthesis. One of the key substances reduced in this sequence was identified as ferredoxin, an iron-containing protein.

Muscle Contraction. By combining studies of the properties of isolated muscle proteins and of electron microscopic observations on intact muscle fibers, a considerable understanding of muscle contraction has been obtained. The earlier concept that ATP breakdown is a necessary concomitant of a single muscle twitch is more firmly substantiated.

Setsuro Ebashi showed that a delicate balance of calcium ion concentration, controlled by a sarcoplasmic reticulum (an interconnecting membrane system in the muscle cell) surrounding a myofibril (contractile element), probably serves as the basis of contraction control. How ATP drives contraction still remains obscure, however.

Enzyme Mechanisms. The study of enzymes, the biological catalysts, has reached a stage where there now is considerable knowledge of the details of their action. For instance, research on the hydrolytic enzyme chymotrypsin gave a clear definition of the roles of certain serine and histidine residues at the active catalytic site. Combination of such catalytic requirements and organic reactions made possible the synthesis of specific inhibitors for reaction at the active sites of enzymes.

A development of considerable importance is the recognition of change in the catalytic capacity of enzyme molecules as a widespread cellular control mechanism. Enzymes functioning in key branch points of metabolic pathways have binding sites for substrates involved in the enzyme-catalyzed reaction, as well as for other molecules which depress or enhance catalytic activity. These specific binding sites set up a "feedback" mechanism by which the amount of the end product of the metabolic chain can inhibit or activate the initial enzyme reaction. Thus, when the cell has a sufficient amount of a given product, the synthesis of this product is shut off by the inhibiting factor. Such enzyme control helps an organism maintain its complex balance of cellular constituents in a changing environment.

Protein Structure. An intriguing blend of biological and chemical techniques was used in studies on the evolutionary changes that occur in the primary sequence of amino acids in proteins. Emil Smith and his associates showed that in all species certain amino acid residues are found in key positions in the important respiratory pigment, cytochrome C. These "constant" residues are important for determining the structure and function in the organism, but other residues may undergo a change in the evolutionary process without important modification in structure or properties. Such differences help to define evolutionary relationships and to obtain an understanding of which amino acids are important for structure and function.

Nucleic Acids and Protein Synthesis. The study of protein synthesis is important because it eventually will provide fundamental information about growth and differentiation. This information is one of man's best hopes for the control of cancer and metabolic diseases.

The mechanism of protein synthesis involves nuclear DNA, the synthesis of messenger RNA, the formation of activated amino acid derivatives on low molecular weight RNA, and the assembly of protein molecules on the RNA-protein-ribosome complexes. This mechanism has been described in

detail by François Jacob and Jacques Monod, who jointly received the 1965 Nobel Prize in physiology, principally for their contributions to the understanding of this chain of events.

They proposed that protein synthesis was controlled by a genetic "repressor." They envisaged the target area of control as an "operon"—a unit of adjacent genes with related function on a chromosome. The action of the "operon" is controlled by an "operator," which itself is under the control of a specific repressor. If the repressor is in an active state, it binds the operator, causing it to switch off the operon controlling the synthesis of a certain protein or enzyme.

The beautifully simple concept of a genetic transmission of information by a linear genetic code in DNA continued to get more support. The work of Marshall Nirenberg, Severo Ochoa, and Sidney Brenner, among others, provided a nearly complete definition of the required triplet arrangement of the nucleotide bases in the DNA molecule. With this definition, the particular amino acids which should be inserted into the growing protein chain could be specified.

Evidence continued to accumulate supporting the viewpoint that the specification of a linear sequence at the site of synthesis is sufficient for the assembly of the complex three-dimensional structure of the protein molecule. Individual protein molecules may then associate to give multimolecular complexes, cellular organelles, and, ultimately, intact cells.

How the chromosome itself is duplicated remained unsolved. Arthur Kornberg and his associates achieved the enzymic synthesis of DNA *in vitro*. However, they were capable only of synthesizing one strand of the helical duplex structure of DNA. The system in the intact cell synthesizes two helical duplex strands from one helical duplex used as a template. (See GENETICS.)

BLINDNESS

Several new instruments and techniques were developed in 1964 and 1965 for use in the never-ending battle against blindness. These included implements and methods for performing rapid eye surgery and cryosurgery, and electronic pencils to help blind persons read. In addition, ultrasound and laser beams facilitated eye operations, and intravenous fluorescein aided eye photography.

Rapid Eye Surgery. The new instruments for rapid eye surgery were iris scissors, scleral punches, corneal splints, and multiple-tip diathermy needles. The first three instruments will prove invaluable to eye surgeons who must make many and quick on-the-spot operations following a disaster. The fourth will be useful in retinopathy.

Advances in corneal surgery included an improved automatic corneal trephine (cylindrical saw), the refining of the process of using an alpha-chymotrypsin solution to make lens removals easier, a simplified method for preserving donor eyes for

Eye "SURGERY" is performed by using a laser coagulator beam to "weld" detached or torn retinas to the eye.

transplantations, and a sterile kit for the long-term preservation of donor eyes.

Cryosurgery. In cryosurgery (the use of extreme cold in operations), a new method proved successful in introducing intense cold to the area of the retina without damaging the scleral (outer) wall of the eyeball. This process, called cryopexy, will reduce the need for scleral resection. Cryopexy can also be used in treating impending retinal tears when coagulation is not advisable because of lens changes or vitreous hemorrhage.

A new supercooled cryoextractor was developed for use in cryoextraction of cataracts. This cryosurgical probe defrosts rapidly and will disengage more quickly on completion of an operation.

Electronic Pencils. The appearance of two kinds of electronic pencils—one for the Roman alphabet and one for the Cyrillic (Slavic) alphabet—will enable blind persons to read books other than those printed in Braille.

Ultrasound Technique. Ultrasound proved effective in locating nonmagnetic foreign bodies embedded in the eye. This method, similar to sonar, utilizes a crystal loudspeaker to transmit short bursts of high-frequency sound through the eye. On hitting an obstacle—for example, a tumor—the sound reflects as an echo, which can be made to appear visually on a cathode ray tube screen. The information can be photographed for the study and location of the foreign body.

Laser Beams. A hand-held direct-view laser photo-coagulator under development will simplify the procedures for treating impending retinal detachment and sealing small tears and holes. The laser produces a pulse of light energy which passes through an optical system in the instrument head and is reflected into the patient's eye. The lens of the eye focuses the laser beams to produce a minute coagulation. The retina is "welded" to the choroid by a series of these coagulations through repeated pulses from the laser.

Photographing the Fundus. A big advance in studying the fundus of the eye occurred with the discovery that fluorescein can be injected into the patient's veins to outline obstructions in the chorioidal blood vessels for photographing.

Ophthalmologist*

BOATING

On Jan. 1, 1965, there were an estimated 7,700,000 pleasure boats in the United States. This number was expected to increase to 7,900,000 by Jan. 1, 1966. Fishing, cruising, water skiing, and hunting, in that order, were the principal reasons for boat ownership.

Sales. The pleasure boating industry registered a 12% retail business increase in 1965 over the previous year. Manufacturers' sales of both inboard and outboard boats, outboard motors, inboard engines, accessories, and hardware increased about 5% in 1965. Unit sales in 1965 of outboard boats (250,000), outboard motors (393,000), and boat trailers (130,000), however, remained below the 1961 level, despite the improved sales picture. An increased emphasis on service and on the sale of replacement parts boosted dealer income and profits in 1965 to their highest level.

Of special significance to the boating industry was the increased interest in sailboats, canoes, houseboats, pontoon boats, inboard-outdrive powered boats, and electronic gear. Sailboat and canoe sales doubled annually between 1963 and 1965. More than 40,000 canoes and 25,000 sailboats of all sizes were sold in 1965. Several hundred stock boat-builders offered all or several of their 1966 models with inboard-outdrive power. Sales of this new power option increased from 20,000 units in 1964 to 30,000 in 1965, and industry authorities predicted a 35,000-unit market for 1966.

Industry Trends. Many boating retailers diversified their operations to combat seasonal slumps by stocking camping equipment and nautical clothing, and by establishing surfside restaurants and cabana colonies. The horsepower competition between major outboard motor manufacturers continued with the introduction of a 110-horsepower model in 1966. The average length of the new outboard boat sold in 1965 was 15.3 feet, a gain of 0.3 feet over the 1964 figure.

Fiber glass continued to be the predominant boat-

SAILBOATING in such boats as this 19½-foot Corinthian sloop with fiber glass hull became more popular in 1965.

building material. Next came aluminum, particularly for use in smaller boats such as canoes, rowboats, prams, and small runabouts. Regardless of the hull material, more use was made of fine woods as trim on boats, thus combining the practicality of fiber glass or aluminum with the characteristic beauty of wood.

The trend continued in the 1966 models toward the use of more chrome and upholstery, wall-to-wall waterproof carpeting, and more builder-installed accessories. This trend was strengthened further by Chrysler Corporation's entry into the pleasure boating market.

Jet-drive boats continued to receive wide acclaim, although only 1,400 of them were sold in 1965. Improvements in their engineering, however, probably will lead to their increased acceptance.

A shortage of berthing facilities continued in 1965, despite the rapid increase in marina installations.

CHARLES A. JONES
Editor, "Boating Industry"

H.A. BRUNO & ASSOCIATES, INC.

PLEASURE CRAFT, particularly cruisers and sailboats, were among the popular attractions at the annual National Boat Show, which was held at the New York Coliseum from Jan. 14 to 23, 1965. The five floors of exhibits held more than 500 boats from 400 exhibitors.

BOLIVIAN SOLDIERS were sent to the Catavi tin-mining area in September to put down a rebellion of miners who were protesting the government's efforts to reorganize some of the mines.

BOLIVIA

Widespread strikes, riots, and antigovernment plots troubled Bolivia during 1965. Most of the agitation was led by supporters of former President Victor Paz Estenssoro, who had been overthrown in November 1964 and replaced by a military junta. Despite political unrest, the new government restored a degree of economic stability to Bolivia.

Military Junta. In May 26, 1965, Gen. Alfredo Ovando Candia, commander in chief of the Bolivian armed forces, was installed as copresident with Lt. Gen. René Barrientos Ortuña.

During the year the ruling junta exiled leaders of dissident political groups, considerably weakening the major opposition parties. Those exiled from the Movimiento Nacionalista Revolucionario (MNR), the former governing party, included ex-President Hernán Siles Zuazo and most of the former ministers of government. The junta also exiled Juan Lechín Oquendo, former vice president under Paz Estenssoro, and head of the Party of the National Revolutionary Left (PRIN), the tin miner's union, and the Bolivian Workers' Confederation. Top Communists, including labor leaders Federico Escobar and Ireneo Pimental, also were exiled.

BOLIVIA · Information Highlights

Area: 424,163 square miles.

Population: 3,702,000 (July 1, 1965 est.).

Chief Cities (1965 est.): Sucre, the capital, 58,549; La Paz, 366,487; Cochabamba, 95,083; Oruro, 94,336.

Government: Junta copresidents—Lt. Gen. René Barrientos Ortuña (took office Nov. 4, 1964), Gen. Alfredo Ovando Candia (took office May 26, 1965). Parliament—Senate, 27 members; party seating (1964)—Movimiento Nacionalista Revolucionario (MNR), 22; Partido Revolucionario de Izquierda Nacionalista (PRIN), 5; Chamber of Deputies, 73 members; party seating—MNR, 57; PRIN, 9; Falangists, 3; Authentic Revolutionary Party, 2; Social Christian Party, 1; Unión Cívica Nacional, 1.

Religious Faiths: Roman Catholics, 94% of population; Protestants, 2%; others, 4%.

Education: Literacy rate (1964), 37% of population aged 5 and over. Total school enrollment (1964)—587,370 (primary,

495,000; secondary, 73,190; teacher-training, 2,980; technical, 6,500; university, 9,700).

Finance (1964): Revenues, \$68,400,000; expenditures, \$61,800,000; monetary unit, peso (12 pesos equal U.S.\$1).

Economic Indexes (1965 est.): Industrial production, 139 (1958=100); cost of living, 172.1 (1958=100).

Gross National Product (1964): \$542,000,000.

National Income (1964): \$468,000,000; average annual income per person, \$128.

Manufacturing (metric tons): Gasoline (1963), 118,000; sugar (1964), 101,000; cement (1964), 64,000; meat (1961), 27,000; wheat flour (1963), 8,000.

Crops (metric tons): Potatoes (1961), 565,000; maize (1960), 205,000; barley (1961), 69,000; cocoa beans (1964), 2,000.

Minerals (metric tons, 1964): Tin, 24,700 (ranks 3rd among world producers); antimony, 9,640 (world rank, 3rd); silver, 4,822,611 troy ounces (world rank, 9th); gold, 50,043 troy ounces; lead, 17,682; zinc, 9,400; crude petroleum, 3,195,000 barrels; tungsten, 2,073 (world rank, 6th); sulfur, 10,806; copper, 4,681.

Foreign Trade (1964): Exports, \$85,600,000 (chief exports, including costs of freight and smelting metals abroad: tin, \$80,900,000; silver, \$6,200,000; lead, \$4,900,000; zinc, \$3,100,000; tungsten, \$1,400,000); imports, \$96,600,000 (chief imports, 1962: wheat flour, \$9,910,000; motor vehicles, \$5,960,000; medicaments, \$2,700,000). Chief trading partners (1963): U.S. (took 32% of exports, supplied 51% of imports); Great Britain (took 47% of exports, supplied 6% of imports); West Germany (took 5% of exports, supplied 14% of imports).

Transportation: Roads (1964), 15,094 miles (382 paved); motor vehicles (1964), 27,784 (automobiles, 9,000); railways (1963), 1,734 miles; national airline, Lloyd Aéreo Boliviano; principal airport, La Paz.

Communications: Telephones (1964): 19,500; radios (1963), 360,000; newspapers (1961), 6 (daily circulation, 92,000).

RIOTING broke out in La Paz in May after Bolivian government deported Juan Lechín Oquendo, top labor leader and ex-vice president.

Legislation. In the field of legislation, the junta promulgated a new mining code to stimulate investment in the private sector of the economy, revised the election law, strengthened the agrarian reform law, and decreed new labor legislation intended to inhibit the political participation of union leaders. The junta abolished the Bolivian Workers' Confederation and replaced it with the government-controlled Central Union Organization.

Elections. The junta rescheduled elections several times during the year. Elections for president, vice president, and members of congress were finally set for the first part of 1966. After Barrientos announced his candidacy for the presidency, both the military and the political parties requested that he resign from office six months prior to elections, as stipulated in the constitution. The Popular Christian Movement was formed to support his candidacy.

Police Conspiracy. On January 3 the government forestalled a conspiracy by the federal police force to overthrow the Barrientos regime. More than 100 alleged plotters were arrested. The government identified the leaders of the plot as followers of Paz Estenssoro. The federal police force was disbanded and replaced by a National Guard for Public Security.

Miners' Strike. Armed workers seized 16 government-owned mines on May 16, protesting the exile of Lechín Oquendo, head of the tin miners' union and of the Bolivian Workers' Confederation. The miners also protested the government's planned reorganization of mines that lose money, a move which threatened to abolish 7,000 jobs. The Workers' Confederation called a general strike to demonstrate sympathy for the 30,000 striking miners, and about 6,000 additional workers responded. The walkouts temporarily paralyzed the economy.

On May 23 the government issued a decree placing the tin mines under military rule and enlisting all miners in the armed forces. Heavy fighting took place between the miners and the soldiers sent to occupy the mines. At least 48 persons were killed and 284 were wounded before a truce agreement ended the fighting on May 25.

Discontent in the Schools. The teachers' unions threatened to call a strike unless wages were increased. University and secondary school students demanded that the junta allocate funds to improve educational facilities. Leftist students protesting U.S. action in Santo Domingo attacked the U.S. embassy in La Paz on April 3.

Economy. The economic picture brightened in 1965, as the gross national product increased by an estimated 4.5% over the preceding year. The greatest increase came in agricultural production, although the output of petroleum also rose considerably. External earnings increased because of favorable trade terms and a rise in tin prices on the world market. The government cancelled trade agreements favoring certain nations, and the country reverted to a free trade system. Major investments were made in road construction and the cultivation of new land, and austerity measures were introduced to help curb rising inflation. In October the Inter-American Development Bank, the U.S., and West Germany, announced a \$10 million financing plan for Bolivia's reorganized mines.

BOOK PUBLISHING

Book sales in the United States established a new high of nearly \$2.25 billion in 1965. This figure included sales in all divisions of the industry—general trade, including children's books; mail order, including book clubs; encyclopedias and other reference works; technical and business books; paperbacks, both "quality" and mass market; and textbooks.

Sales of textbooks at all levels skyrocketed. The increase was due in part to the books purchased under the newly enacted National Defense Education Act, the federal anti-poverty program, and the Secondary Education Act.

Export sales totaled nearly \$200 million in 1965. During the year, book publishing stocks remained at high levels, and many publishing stocks registered new highs.

Best Sellers. In the early months of 1965, the leading fiction best sellers were Saul Bellow's *Herzog* (Viking), Irving Wallace's *The Man* (Simon & Schuster), and Gore Vidal's *Julian* (Little, Brown). The nonfiction list for the same period was led by Dag Hammarskjöld's *Markings* (Knopf) and Luigi Barzini's *The Italians* (Atheneum). At midyear the Hammarskjöld book was challenged for top position by Samuel Eliot Morison's *The Oxford History of the American People* (Oxford), Theodore White's *The Making of the President 1964* (Atheneum), and Larry Collins and Dominique Lapierre's *Is Paris Burning?* (Simon & Schuster).

During the summer the top fiction sellers were James Michener's *The Source* (Random House), Bel Kaufman's *Up the Down Staircase* (Prentice Hall), Morris West's *The Ambassador* (Morrow), and Arthur Hailey's *Hotel* (Doubleday). All four were still selling well at the close of the year and were joined by John Le Carré's new mystery, *The Looking Glass War* (Coward McCann), Irving Stone's *Those Who Love* (Doubleday), and Robin Moore's *The Green Berets* (Crown).

During the Christmas season the nonfiction field was led by Theodore Sorensen's *Kennedy* (Harper & Row). Other leading sellers were Arthur Schlesinger Jr.'s *A Thousand Days* (Houghton Mifflin); *Intern*, by Dr. X (Harper & Row); *Yes I Can*, an autobiography by Sammy Davis (Farrar, Straus & Giroux); *Games People Play*, by Eric Berne (Grove Press); and *A Gift of Prophecy* by Ruth Montgomery (Morrow). (See also AMERICAN LITERATURE.)

Conferences. The International Publishers Association, with the American Book Publishers Council as host, met in Washington, D.C., on May 30, 1965, with 1,500 delegates from all parts of the world attending. American publishers hoped that the U.S. Congress would complete a revision of the obsolete U.S. copyright law before the conference opened. However, legislation bogged down over attempts to rewrite the law to satisfy both factions in a dispute over "fair use," or the role of computer reproduction as related to the storage and retrieval of textbook material.

A major conference on the use of paperback books in the schools was held at Columbia University, New York City, on October 7. It was hoped that the conference would result in more new titles (over 35,000 titles were in print in 1965) and in a wider use of paperbacks among the general public as well as in the schools.

National Award. The first of the National Book Committee's National Medal for Literature was

presented to Thornton Wilder at the White House on May 4. The annual award honors an American author for the body of his work. (See also **PRIZES AND AWARDS**.)

Censorship. The U.S. Supreme Court agreed to hear arguments on an appeal of the ruling by the Massachusetts Supreme Court that the novel *Fanny Hill* by John Cleland is obscene. It is expected that the federal court's decision will clarify the legal definition of obscenity in the United States.

Title Figures. Titles published in 1965 totaled 28,595, as compared with 28,451 in 1964. The breakdown for the major categories in 1965 (with 1964 figures in parentheses) was: fiction, 3,241—down 0.9% (3,271); religion, 1,855—up 1% (1,830); science, 2,562—down 6% (2,738); technical, 1,153—up 2% (1,125); juvenile, 2,859—up 3% (2,808); education, 954—down 23% (1,232).

BOSTON

Throughout 1965, Boston's major problem was racial imbalance in the city schools. On Oct. 1, 1965, there were 46 predominantly Negro schools, enrolling 23,919 nonwhite students out of a total school population of 93,055. When schools opened in September, some parents undertook to transport their children to less crowded schools, and the state legislature enacted a law forbidding the imbalance. Massachusetts thus became the first state to pass a law forbidding racial imbalance in its public schools. A majority of the five-member school committee denied the contention that the situation was harmful to Negro children, and their position was the central issue of the November election. Most of the incumbents won reelection.

Urban Renewal. Boston's vitality was demonstrated by its urban renewal program. During the year, the Prudential Tower was dedicated, and the War Memorial Auditorium and the Sheraton-Boston Hotel were opened (all are part of the Prudential Center complex). In the government center, new state and federal office buildings neared completion. Private building plans went forward, including those of the Christian Science Church to redevelop a large tract in the Back Bay area. However, some residents strongly opposed the Charlestown and North Harvard Street (Allston) projects, and scattered protests occurred elsewhere.

The question of urban renewal was the main issue in the City Council election in November. Most of the nine incumbents, a majority of whom favored urban renewal, won reelection.

Education. In September the Boston branch of the University of Massachusetts opened its doors to freshmen. The Massachusetts Bay Community College opened a branch in Watertown, and plans progressed toward a permanent site for a community college in Charlestown. Harvard University opened new quarters for its Graduate School of Education and the Massachusetts Institute of Technology completed the Bush Earth Science and Materials Center.

The presidents of Wellesley College, Tufts, and Boston University announced their resignations during 1965.

In a related area, Milton Lord retired as director of the Boston Public Library. He was succeeded by Philip McNiff.

Economy. A slow rate of growth was recorded in Boston's economy. The value of products manufactured in the city was \$1,526,680,212 in 1963, and in the 18 communities of the Greater Boston industrial area, \$3,279,600,515. The number of employed production workers in the area reached 287,400 in August 1965, with average weekly earnings of \$106.50. Imports through the port of Boston in 1964 totaled 6,124,068 tons; exports totaled 1,008,007 tons.

Tax Rate. Boston's tax rate was increased in 1964 by \$15.20, to \$115.00 on \$1,000 value of

THE PRUDENTIAL CENTER

BOSTON'S SKYLINE is dominated by the Prudential Tower. The new 52-story skyscraper is part of the \$150 million Prudential Center, dedicated in 1965. The complex also contains a 29-story hotel and a civic auditorium.

property. The city budget increased by over \$10 million, to \$136,534,885. The gross city debt, as of Oct. 1, 1964, was \$144,412,500, and the net debt was \$99,377,315. The city's assessed property valuation increased slightly, to \$1,460,000,000. Mayor John F. Collins, together with business leaders of the city, campaigned for the adoption of a sales tax by the state legislature.

Population Decrease. Like most large American cities, Boston experienced a population decrease in the early 1960's. The state census of 1965 showed 616,326 inhabitants in the city, compared with 697,197 in the 1960 federal census. During this five-year period, other cities of the metropolitan area, such as Somerville, Cambridge, and Lynn, also decreased in population, while the outlying suburbs gained. The population of the metropolitan area increased from 2,589,301 to 2,597,971 in the same period.

GEORGE D. BLACKWOOD

Professor of Political Economy, Boston University

BOTANY

In 1965, as in previous years, an increased use was made of botanical data in diverse fields of scientific endeavor. The information obtained from botanical investigators has been of value to research projects in agriculture, genetics, medicine, conservation, population studies, and space exploration.

Music and Plant Behavior. Since 1953 there have been several published reports on the positive effects of sound on the growth of plants. Two botanists from India, T.C.N. Singh and S. Ponniah, have strongly advocated the use of music to increase growth in different types of plants. However, R.M. Klein and P.C. Edsall exposed plants that were grown in a rigidly controlled environment to various types of music. The data obtained from their experiments showed that no musical selection had a significant effect on the growth of vegetative or reproductive structures.

Exobiology (Exobotany). Scientists disagree about the status of exobiology, the study of extraterrestrial

life. (Various other terms, such as xenobiology, have been used, but exobiology has been adopted by the National Aeronautics and Space Administration and is now part of the language.) The major question in this field is whether life is found only on the earth.

At present, only indirect evidence of extraterrestrial life is available. This evidence, according to W.M. Sinton, is based on strong statistical arguments and on infrared spectroscopic analyses of Mars. Most investigators suggest that Mars is the one planet in our solar system on which life may be found. Photographs taken of Mars by Mariner 4 on July 14, 1965, did not reveal any signs of life on the planet, though they did not prove that no life exists there. The idea that Mars is the only planet that can support life in all the cosmic vastness of a universe containing about one trillion galaxies is a severe test of the imagination. See also ASTRONOMY.

Antibiotics in Botanical Research. The effect of antibiotics on botanical processes has been under investigation since 1955. The assumption that a compound having a well-established specificity in microbiological or animal metabolism acts in a similar way on higher plants was challenged in 1965 by J.D. Mann. It has been shown that data bearing on the mode of action of antibiotics in lower plants or various animals may not apply to higher plants. Botanists have been using antibiotics increasingly for research in the last couple of years, and Mann warned that this may amount to a misuse of antibiotics. "Time devoted to such almost non-specific inhibitors can be misleading, if not wasted effort," he said. He suggested some alternatives indicated by his data as better methods for investigating these botanical problems.

Antarctic Plant Life. Antarctic botanical research has revealed that lichens (algae and fungi) and mosses are the largest group of plants that grow in this remote region of the world. In contrast, the flowering plants on the Antarctic continent are limited to two species—*Colobanthus crassifolius*, a wild carnation, and *Deschampsia antarctica*, a type

GROWING PLANTS in stress environments is one method used to determine whether life can survive under the environmental conditions found on other planets. Ammonia gas is added above to the test bottle to simulate an atmosphere like that of Jupiter and of ancient earth.

IN THE MARS SIMULATOR II, plants are grown under conditions similar to those on Mars. The simulated atmosphere has no oxygen, little water, and temperatures from 70°F to -20°F. Mature plants did not survive under Martian conditions, but young shoots from the same species could adapt to the new environment.

UNION CARBIDE PHOTOS

PLANT TOLERATION OF COLD was tested by growing plants in soil kept at the temperature of liquid nitrogen (-320°F). The experiments showed that actively growing plants could not survive while more dormant plant forms, such as seeds and spores, were able to survive cold.

of grass—which grow only on the part of the Antarctic Peninsula nearest South America. Lichens, found more frequently than mosses, grow everywhere on the continent in the driest and least protected rocky localities. Most plants in the area reproduce asexually, and many have specialized means for increasing vegetative reproduction. The taxonomic and ecological data, though slight, form a beginning for understanding physio-ecological plant problems in the rigorous environment of the Antarctic Peninsula.

Shoot Development. In the general field of morphogenesis (development and growth), the shoot apex has been studied by botanists working with techniques borrowed from different disciplines. In the past, studies of shoot development have been concerned with investigations of progressively smaller segments of the apex. Recent data indicate that additional studies of nucleic acid metabolism within the cells of the embryonic tissue of the apex (apical meristem) may be very profitable in helping to understand shoot development.

Research with nucleic acids has shown that they are probably involved in several facets of shoot development and organization. Investigators have also suggested that it is important to consider the various activities of nucleic acids as components of the cells in the apical meristem, and then to consider the role of the apical meristem as a portion of the whole plant.

Genetics in the Soviet Union. The recent removal of T.D. Lysenko as director of the Institute of Genetics of the Academy of Sciences of the USSR seems to indicate the development of a less emotional and a more intellectual approach to biological science within the Soviet Union. The revival of non-Lysenko genetics in the USSR may well lead to new approaches toward genetical problems in that country.

Symposiums. The Gregor Mendel Memorial Symposium and the Symposium on Mutational Process were held in Brno and Prague, Czechoslovakia, in August 1965. Approximately 900 biologists attended these symposia in commemoration of the centenary of Mendel's genetical discoveries.

BRAZIL

After following a moderate policy during its first 18 months in power, Brazil's revolutionary government, headed by President Humberto Castelo Branco, took drastic action in October 1965 to override rising opposition. The government also continued to pursue an unpopular economic stabilization program that was beginning to show results after a temporary recession. International financial agencies, which provided heavy support, awaited the outcome of developments as Brazil began to undergo a major test of its capacity to restore political stability and resume economic growth.

Political Changes. The year opened with minor political victories for President Castelo Branco. His

Minerals (metric tons, 1964): Iron ore, 15,000,000 (ranks 10th among world producers); manganese, 1,080,638 (world rank, 4th); salt, 754,000 (world rank, 17th); bauxite, 168,000 (world rank, 20th); tin, 1,697 (world rank, 11th); gold, 134,326 tray ounces (world rank, 15th); gem diamonds, 175,000 carats (world rank, 11th).
Foreign Trade (1964): Exports, \$1,433,000,000 (chief exports, 1964: coffee, \$760,000,000; cotton, \$108,000,000; cacao, \$35,000,000); imports, \$1,263,000,000 (chief imports, 1963: nonelectrical machinery, \$240,660,000; petroleum, \$176,360,000; wheat, \$164,000,000). Chief trading partners (1963): U.S. (took 38% of exports, supplied 31% of imports); West Germany (took 8% of exports, supplied 9% of imports); Netherlands (took 8% of exports, supplied 1% of imports).
Transportation: Roads (1964), 311,510 miles (9,231 paved); motor vehicles (1964), 1,459,121 (automobiles, 761,004); railways (1963), 22,515 miles; merchant vessels (1964), 238 (1,146,000 gross registered tons); airlines, Panair do Brasil; Serviços Aéreos Cruzeiro do Sul, S.A.; VARIG; VASP; principal airports, Belo Horizonte, Brasília, Recife, Rio de Janeiro, Salvador, São Paulo.
Communications: Telephones (1964): 1,207,566; television stations (1964), 41; television sets (1964), 2,300,000; radios (1961), 4,700,000; newspapers (1963), 255 (daily circulation, 4,213,000).

associate, Marshal Emilio Rodrigues Ribas, was installed as governor of the state of Goiás, after federal troops were used to remove Gov. Mauro Borges Teixeira, who was charged with subversion.

In February the president also prevented the reelection of Ranieri Mazzilli as president of the national Chamber of Deputies. Mazzilli, who was accused of corruption, had held the post for seven years and was a key figure in the Social Democratic party of former President Juscelino Kubitschek. He was replaced by Bilac Pinto, leader of the National Democratic Union party, which had supported the revolutionary overthrow of President João Goulart in April 1964.

The outcome of an election on March 21 for mayor of São Paulo, Brazil's principal industrial city, was regarded as a setback for the national government. The election was won by José Vicente Faria Lima, a retired air force general backed by former President Jânio Quadros.

The radical, "hard line" wing of President Castelo Branco's military supporters, fearing that other elections would result in victory for leaders of the opposition associated with former Presidents Goulart, Kubitschek, and Quadros, urged the postponement of forthcoming state elections. President Castelo Branco, however, decided to permit elections and prevailed on Congress to pass a "law of ineligibilities" disqualifying as candidates former cabinet members of the Goulart and Kubitschek governments, as well as certain state officials.

Gubernatorial Elections. The election for state governors on October 3 precipitated a major crisis in spite of the law of ineligibilities. Government candidates won in only four minor states, and candidates favorable to the government won in only another three. Two important posts, the governorships of the states of Guanabara and Minas Gerais, went, respectively, to Francisco Negrão de Lima and Israel Pinheiro, close associates of former President Kubitschek. These candidates had the backing of Kubitschek's Social Democratic party and ex-President Goulart's Brazilian Labor party. Candidates of this coalition also won in Mato Grosso and Goiás.

The defeat of Carlos Flexa Ribeiro, whom Gov. Carlos Lacerda selected as his intended successor in Guanabara, dealt a severe blow to Lacerda's presidential aspirations. An early supporter of the revolutionary regime, Lacerda was the announced candidate of the National Democratic Union.

Presidential Powers Broadened. After the elections, military leaders pressed for greater federal powers over state governments and for other measures aimed at suppressing the opposition. On October 27, after Congress failed to respond, President Castelo Branco issued a sweeping series of decrees which virtually granted him dictatorial powers. All 13 political parties were dissolved and a new party, the National Renovating Alliance, was formed. The new party combines conservative and moderate forces that support Castelo Branco and will work to maintain his policies and elect his successor. President Castelo Branco, declaring himself ineligible for reelection, decreed that the Congress, not popular vote, will choose a new president by Oct. 3, 1966.

The government resumed the power to impose federal control over states in cases of internal disturbance, to rescind elections, and to suspend the political rights of persons who opposed the revolu-

tion. The number of Supreme Court justices was increased from 11 to 16 to give the president power to influence the court. Acts of the government were removed from the jurisdiction of the civil courts, which several times had reversed the action taken by revolutionary tribunals.

Economic Planning and Government Actions. The economic "Plan of Action" came under criticism from nearly all quarters, although it influenced the decision of the United States, European countries, and international agencies to subscribe about \$1 billion in financial assistance to Brazil in 1965. Devised by Planning Minister Roberto Campos and Finance Minister Otavio Bulhões, the plan provided for inflation controls, a reduction in the federal budget, a more favorable balance of payments, and social reforms.

Complaints arose when the program caused a slump in the sale of automobiles and household appliances. Industrial workers were laid off, and several large firms were forced into bankruptcy, partly because of tighter credit regulations.

The gross national product, which had increased 2% in 1963, showed a decline of 3% in 1964. Agricultural production improved in 1965 because of good weather conditions, and, by August 1965, industrial production throughout the country showed signs of recovery.

The administration took several steps to encourage private enterprise and foreign investment, which had declined sharply prior to the revolution. Financial settlements were reached with the American and Foreign Power Company regarding the company's subsidiaries, which the Brazilian government had expropriated. Private companies were allowed to construct port facilities for the export of iron ore. President Castelo Branco canceled a 1964 decree expropriating private oil refineries and opened petroleum shale deposits to outside development.

Inflation. The rise in the cost of living, which had increased 87% in 1964, was held to a 41% increase in the first ten months of 1965. However, prices exceeded the limits imposed by the Plan of Action. Consequently, it was difficult to maintain the government's wage control policy, and wage increases of 30 to 49% were granted to public power and petroleum employees.

Under the new economic plan, the government attempted to combat inflation by voluntary cooperation; over 4,000 firms agreed to limit price increases in return for credits and tax concessions. This policy, however, was unsuccessful, and the government later reduced excise taxes to stimulate sales of durable goods.

As another anti-inflation measure, the government made efforts to reduce the budget deficit. On

HUMBERTO CASTELO BRANCO, president of Brazil, overrode Congress and the Supreme Court to take on broad new presidential powers on Oct. 27, 1965. Considered to be an outstanding military leader, a great intellectual, and a staunch defender of democratic government, Castelo Branco assumed sweeping powers to prevent a powerful resurgence of extreme leftist forces. These forces had been removed from the government by the military coup which overthrew President João Goulart on April 11, 1964.

Castelo Branco was born in Fortaleza, in the state of Ceará, on Sept. 20, 1900. A member of a military family, he graduated with high honors from Brazil's Escola Militar do Realengo in 1921. After receiving special officer's training in France and the United States, he served during World War II on the general staff of the Brazilian Expeditionary Force in Europe. He became a lieutenant general in 1962. Congress elected him president on April 11, 1964. He was married in 1922 to Argentina Vianna (she died in 1963) and has two children.

WIDE WORLD

WIDE WORLD

BRAZILIAN VOTERS in Rio de Janeiro elected an antigovernment candidate as governor of the state of Guanabara.

the advice of the International Monetary Fund, a new central bank was created to control paper money and deficit financing. The government reduced expenses by removing subsidies on petroleum and wheat imports. But losses on the state transport system, which accounted for 41% of the total budget deficit in 1964, continued to be high.

Debt Relief. Brazil's internal problems were complicated by a huge external debt, second only to India's among the developing countries of the world. After the Castelo Branco government defined its policies, the United States organized a \$1 billion rescue operation. The Alliance for Progress provided \$150 million for the stabilization of Brazil's finances, and \$100 million for development projects. The U.S. Treasury committed \$54 million in a foreign exchange loan, and the Export-Import Bank of Washington rescheduled \$30 million of Brazil's debt payments to make reimbursement easier.

The International Bank for Reconstruction and Development (World Bank) approved the new plan and announced its first loan to Brazil in six years. The World Bank invested heavily in power development and sponsored a survey of Brazil's transportation needs. Together with the International Monetary Fund and the Inter-American Development Bank, the World Bank planned investments of \$450 million in Brazil during the year.

Imports and Exports. Brazil's balance of payments improved. After a renegotiation of credits, Brazil achieved a balance of trade surplus of \$70 million in 1964. Further import reductions were expected to produce a \$300 million trade surplus in 1965.

A record sugar crop and good corn and cotton crops led to increased exports in 1965, but coffee sales lagged because of African and Central American competition. Unable to export her quota under the International Coffee Agreement, Brazil cut the price of coffee by one cent a pound in May to force a reduction in quotas affecting other exporting countries.

The government maintained the monetary unit, the cruzeiro at 1,825 per U.S.\$1 during most of 1965, but on November 13 fixed a new rate of 2,200 cruzeiros per U.S.\$1—a devaluation of about 19%. The government also announced that the monetary unit would be replaced on Jan. 1, 1966, by a new "strong" cruzeiro worth 1,000 of the old units.

Land Survey. In mid-December, the Brazilian government began a massive effort to register all rural landholdings in the country. Twenty thousand federal registrars were sent to rural townships in six states, to register all land claims and determine, through questionnaires, land use, marketing

problems, labor conditions, and social hardships. The survey will provide the basis for agrarian reform and federal land tax. Castelo Branco's tax reform law, approved by Congress in November, established federal control over land value assessments and collection of land tax, formerly the prerogatives of municipalities.

Rocket Launching. On December 15, the Brazilian Space Activities Commission (CNAE) successfully launched its first sounding rocket from the space flight center of the National Aeronautics and Space Administration (NASA) in Greenbelt, Md. In an agreement signed in April 1965, CNAE and NASA agreed to cooperate in an investigation of the lower regions of the ionosphere.

Foreign Relations. Notwithstanding scattered opposition at home, the Brazilian government supported the United States in its intervention in the Dominican Republic in April. Brazil contributed 1,250 troops to the Inter-American Peace Force that was sent to Santo Domingo, and Gen. Hugo Penasco Alvim, a Brazilian, was named commander of the international force.

Relations between Brazil and Uruguay, which became strained when ex-President Goulart was given refuge in Uruguay and continued his political activity from there, worsened after the Dominican intervention. The Uruguayan government reacted angrily to reports that Brazil might intervene in Uruguay to prevent a Communist takeover there. (See also *LATIN AMERICA*.)

BREWING INDUSTRY

For the fourth successive year, beer sales in the United States set a record in the fiscal year 1965. Sales totaled 100,306,727 barrels of 31 gallons each. This figure was 4,059,314 barrels higher than the record total of 96,247,413 barrels which had been established in the fiscal year 1964.

The brewing industry also set all-time high monthly sales records in March, May, and June of 1965, and in the first six months of the calendar year 1965. Brewers' sales from January to June 1965 climbed to 49,329,522 barrels, an increase of 3.5% or 1,662,757 barrels over the record set during the same period in 1964.

About 8% of the population of the United States lives in areas where the sale of beer and ale is prohibited. The 1,136 local-option elections in 1964 increased by 56,213 the numbers of persons living in areas where it is legal to sell these alcoholic beverages.

In the calendar year 1964, as in each of the previous nine years, brewers paid more than \$1 billion in state and federal taxes. They contributed over \$6 billion to the national economy. This figure included more than \$210 million for agricultural products and \$530 million for kegs, bottles, cans, related materials, and containers. It also included \$485 million in direct salaries and wages, as well as substantial amounts in fringe and other benefits.

BLACK STAR

THE VERRAZANO-NARROWS BRIDGE, majestic link between Brooklyn and Staten Island, N.Y., carried 17,079,675 vehicles—35% above forecasts—in its first year.

BRIDGES

Bridge builders around the world continued to construct major spans in 1965, and officials announced plans for many new bridges. In the United States, bridge building received further impetus as the huge interstate highway construction program made impressive headway and Congress passed legislation for a federally sponsored program to improve mass transit in major metropolitan areas.

Delaware Bridges. Builders began erecting steel in the shadow of the Delaware Memorial Bridge for the 418-foot-high towers of a twin span. The new bridge will be basically identical to the present bridge, built in 1951, except in price—\$76 million for the new one, as against \$40 million for the old one. Located at the southern terminus of the busy New Jersey Turnpike, each bridge will handle one-way traffic, beginning in 1967.

Four future Delaware crossings were announced during 1965. The Delaware River Port Authority approved construction of a \$45 million bridge to link Philadelphia, Pa., and Delair, N.J., and a \$55 million span between Chester, Pa., and Bridgeport, N.J. The Delaware River Joint Toll Bridge Commission announced plans for two bridges—a high-level, toll span between Bristol, Pa., and Burlington, N.J., and a replacement for the 95-year-old

bridge between Trenton, N.J., and Morrisville, Pa.

Newport-Jamestown Bridge. Pier construction will begin in 1966 for a suspension bridge over the East Passage of Narragansett Bay to link Newport and Jamestown, R.I. The 2-mile crossing will have a main suspended span of 1,600 feet with 687-foot-long side spans. The rest of the bridge is trestle-type construction. Scheduled for completion in May 1968, the bridge will cost \$44 million.

Lake Ponchartrain Twin. In the fall of 1965 the Greater New Orleans Expressway Commission signed contracts to begin design work on a twin for the world's longest overwater crossing, the 24-mile Lake Ponchartrain Causeway. The new bridge, paralleling the existing structure, will cost an estimated \$35 million.

Bridge-tunnel Twin. Virginia announced plans to build a second two-lane Hampton Roads bridge-tunnel adjacent to the present crossing between Norfolk and Hampton. Construction will start when revenue bonds used to finance the original structure are paid off, probably in 1972. An interesting sidelight is that engineers estimate the new twin crossing will cost only \$49 million, compared with \$62 million for the existing bridge-tunnel. The reduction in construction cost was achieved because the new tunnel section will surface at the same artificial

islands as the old tunnel. The islands, however, will be enlarged.

Orthotropic Bridges. Ironworkers began to erect steel for two bridges—one in San Francisco, the other in St. Louis—that are contenders to become the nation's first major orthotropic span. (Bridges of orthotropic design have a stiffened steel plate deck that acts both as a roadway deck and as the top flange of the main girders and floorbeams.) The San Francisco structure, the \$70 million San Mateo-Hayward Bridge crossing lower San Francisco Bay, will be 7.4 miles long. A 9,650-foot-long, high-level section of the bridge is mostly orthotropic plate deck on twin, steel-box girders, with the high-level section meeting completed concrete trestle sections at either end. The steel part of the bridge will have 750-foot-long box girders in its center span, which will be the third longest in the world. The St. Louis bridge, the Poplar Street Bridge over the Mississippi River, although a major structure, will not be as spectacular as the California span because of its shorter length.

Golden Gate Double Deck. Directors of the Golden Gate Bridge agreed in principle in 1965 to add a second deck to the famous bridge. Considerable engineering design work has been done, and the final design probably will be selected in 1966. Also in the San Francisco Bay area, the state began to study the feasibility of constructing two other bridges—one to the north, between San Francisco and Marin County, and the other to the east, between the San Francisco Peninsula and Alameda County.

Long Island Sound Crossing. Consulting engineers told the New York State government that it would

be feasible to build a 10-mile-long highway bridge linking the tip of Long Island with Connecticut. The engineers said that the crossing, estimated to cost \$206 million, should also carry railroad tracks.

Canada. Montreal's 1967 world's fair has prompted the construction of two bridges connecting the island site of the fair with Montreal proper, which also is situated on an island. Although relatively small, both spans will be notable. One, a 2,265-foot-long orthotropic plate span, was being completed in early 1966. The other, a 688-foot-long stayed-girder structure, was under way.

Construction will start in 1966 on a 9-mile bridge-tunnel across the Northumberland Strait between New Brunswick and Prince Edward Island. The crossing will include a 3-mile, high-level, double-deck bridge section and a mile-long tunnel.

Construction started in 1965 on a 3,412-foot suspension bridge over the St. Lawrence River at Quebec City. The structure, with a 2,190-foot main span and a 90-foot-wide deck, will be 150 feet above the water.

Denmark. Denmark's Ministry of Traffic announced an international design competition for either a bridge or a tunnel linking the islands of Zealand and Fyn. The islands are separated by the 12.5-mile-wide Great Danish Belt, and the connecting ferry ride takes 45 minutes. Designs must be submitted by April 1966, but construction is not likely to start for five years.

Portugal. In 1965, cable spinners finished the two 23-inch-diameter cables that will support the 3,323-foot main span of a bridge across the Tagus River at Lisbon. The completed bridge will have the longest suspended span in Europe. Work also was under way on the stiffening trusses and deck for the bridge, whose length from anchorage to anchorage will be second only to the bridge across Mackinac Straits.

Italy. Work continued in the Polcevera River Valley, near Genoa, on a 4-lane highway bridge that is notable for both beauty and design. Riccardo Morandi, who designed the Lake Maracaibo Bridge, also designed this 3,358-foot-long bridge that vaults across the valley on 10 free-standing concrete structures. The bridge also includes an elevated interchange and a 3,300-foot approach tunnel.

Egypt. The United Arab Republic completed a record-setting railroad swing bridge over the Suez Canal. The bridge consists of twin swing spans, each 520 feet long. The horizontal distance between turntable centerlines at each edge of the canal is 548 feet—18 feet longer than the Fort Madison, Ia., swing bridge over the Mississippi River.

Venezuela. The Gen. Rafael Urdaneta Bridge over Lake Maracaibo, broken in two during 1964 when an oil tanker damaged two of its graceful concrete towers and dumped three precast spans into the lake, was reopened to traffic during 1965. Ferries, which the bridge had replaced in 1962, went back into service during the 6-month reconstruction period.

Workers began erecting tower steel for a bridge over the Orinoco River that will be the longest suspension bridge in South America. The bridge's center span will measure 2,336 feet.

Brazil. The Mauricio Joppert Bridge, a 7,481-foot prestressed concrete girder span over the Paraná River near São Paulo, was opened to traffic during 1965. In South America, only the bridge across Lake Maracaibo in Venezuela is longer.

WILLIAM W. JACOBUS, JR.
Associate Editor, "Engineering News-Record"

EUROPE'S LONGEST BRIDGE, the Oosterscheldebrug, with 52 spans and 162 pillars in its 3-mile length, opened in 1965 in the Netherlands. It is part of the Scheldt River Delta project that protects Zeeland Province against floods.

KEYSTONE

BRITISH COLUMBIA

The year 1965 in British Columbia was highlighted by large capital investments. Almost \$1.9 billion was expended by government and industry in initiating and expanding power projects and other industrial enterprises.

Construction. Work began in midyear on the \$77 million Portage Mountain powerhouse of the Peace River Power Project, and tenders were called for building transmission facilities. On May 19, ceremonial blasting at the site of Duncan Dam, 55 miles north of Nelson, marked the beginning of construction of the Columbia River Power Project. Two additional dams—the Mica, north of Revelstoke, and the Arrow, near Castlegar—are scheduled for completion by 1973.

As a result of the Peace River and Columbia River projects, the province will acquire a 680-square-mile reservoir, to be known as Peace Lake. This will be the largest lake in British Columbia.

The 78-mile extension of the Pacific Great Eastern Railway into Fort St. James neared completion, and surveys were announced for three further extensions: a 21-mile line from Kennedy to Morfee Lake; a 50-mile branch extending north from Fort St. John; and a 64-mile extension of the Fort St. James branch to Takla Lake.

BRITISH COLUMBIA · Information Highlights

Area: 366,255 square miles.
Population: 1,818,000 (Oct. 1, 1965, est.).
Chief Cities (1961 census): Victoria, the capital (54,941); Vancouver (384,522); New Westminster (33,654); North Vancouver (23,656); Nanaimo (14,135); Prince George (13,877); Penticton (13,859); Kelowna (13,188).
Government: Chief Officers—lieutenant governor, George R. Pearkes; premier and min. of finance, William A.C. Bennett (Social Credit party); prov. secy., Wesley D. Black (SC); atty. gen., Robert W. Bonner (SC); min. of educ., Leslie R. Peterson (SC); chief justice, Henry I. Bird. **Legislature**—Legislative Assembly (convened Jan. 21, 1965), 52 members (33 Social Credit, 14 New Democratic, 5 Liberal).
Education: School enrollment (1963–64 est.)—public elementary and secondary, 369,872 pupils (13,998 teachers); private, 23,242 (1,018); Indian, 5,987 (237); college and university (fall 1964), 18,423. **Public school expenditures** (1963)—\$167,170,000; average teacher's salary, \$5,949.
Public Finance (fiscal year 1965 est.): Revenue, \$400,210,000 (sales tax, \$154,420,000; income tax, \$82,969,000; federal funds, \$1,873,000). **Expenditures**, \$404,600,000 (education, \$106,980,000; health and welfare, \$100,650,000; transportation and communications, \$73,650,000).
Personal Income (1964): \$3,614,000,000; average annual income per person, \$2,079.
Public Assistance (fiscal year 1965 est.): \$32,040,000 (aged and blind, \$14,730,000; dependents and unemployed, \$10,300,000).
Labor Force (1961 census, agriculture and manufacturing only): Agricultural, 23,290; manufacturing, 113,019.
Manufacturing (1962): Value added by manufacture, \$1,022,509,000 (transportation equipment, \$43,022,000; primary metals, \$78,974,000; nonelectrical machinery, \$15,777,000; electrical products, \$12,338,000; fabricated metals, \$52,238,000; food and products, \$180,836,000).
Agriculture (1964 est.): Cash farm income, \$150,083,000 (live-stock, \$95,326,000; crops, \$52,158,000; govt. payments, \$160,000). Chief crops (cash receipts)—fruits, \$23,483,000 (ranks 2nd among the provinces); vegetables, \$8,635,000 (rank, 3rd); wheat, \$3,421,000 (rank, 4th); barley, \$2,717,000 (rank, 4th); potatoes, \$2,547,000 (rank, 5th); flaxseed, \$44,000 (rank, 5th).
Mining (1964 est.): Production value, \$269,293,797. Chief minerals (tons)—zinc, 207,656 (ranks 2nd among the provinces); copper, 57,506 (rank, 3rd); lead, 134,160 (rank, 1st); iron ore, 2,167,559 (rank, 4th); sand and gravel, 22,272,170 (rank, 3rd); crude petroleum, 11,726,180 barrels (rank, 3rd); natural gas, 118,959,880 cubic feet (rank, 2nd).
Forest Products (1964): Lumber, 6,606,000,000 board feet (ranks 1st among the provinces); plywood, 2,086,000,000 (rank, 1st).
Fisheries (1964): Commercial catch, 705,437,000 pounds (\$47,214,000). Leading species—salmon, 118,593,000 pounds (\$28,841,000); halibut, 35,755,000 (\$8,840,000).
Transportation (1963): Roads, 35,072 miles (26,699 surfaced); motor vehicles, 662,453; railroads, 4,329 miles; airlines, 5 (45 airports).
Communications (1963): Telephones, 666,190 (including Yukon Territory); television stations, 8; radio stations, 35; newspapers, 16 (daily circulation, September 1964, 542,024).

CANADIAN PRESS

BRITISH COLUMBIA'S NEWEST UNIVERSITY, named in honor of Simon Fraser, was opened in Burnaby on Sept. 9, 1965, with formal convocation ceremonies in the quadrangle.

Economy. The province's economy maintained a continuing pattern of rapid growth throughout 1965. The installation of steel furnaces at Kimberley marked the completion of an integrated iron-steel operation. Several new base metal mines went into production. One on Boss Mountain and another near Endako, together involving a \$30 million expenditure, promise to make British Columbia the major Canadian producer of molybdenum. A substantial enlargement of pulp and paper capacity in the province was supported by major investments from Great Britain, West Germany, Sweden, Denmark, and the United States.

Legislature. The 1965 Legislative Assembly authorized a provincial medical insurance plan that became effective on September 1. Initial coverage was extended to 95,000 families.

A three-member commission was appointed on August 5 to redraw legislative electoral districts.

Education. A fourth provincial university, Simon Fraser University, was opened in Burnaby in September.

Area: 83,000 square miles.
Population: 628,000 (July 1, 1964, est.).
Chief Cities (1960 census): Georgetown, the capital, 72,965; New Amsterdam, 14,046.
Government: Governor General—Richard Luyt; premier—Linden Forbes Burnham (took office Dec. 14, 1964). Parliament—House of Assembly, 53 members; party seating (1965), People's Progressive Party, 24; People's National Congress, 22; United Force, 7.
Religious Faiths: Christians, 57% of population; Hindus, 33%; Muslims, 9%.
Education: Literacy rate (1965)—80% of population. Total school enrollment (1962)—145,814 (primary, 135,784; secondary, 8,443; technical, 1,363; higher, 224).
Finance (1964 est.): Revenues, \$40,700,000; expenditures, \$40,600,000; public debt (1963), \$74,300,000; monetary unit, West Indian dollar (1.714 dollars equal U.S.\$1).
Gross National Product (1960): \$146,000,000.

National Income (1963): \$135,000,000; average annual income per person, \$221.

Cost of Living Index (1964): 111 (1958=100).

Manufacturing (1963): Sugar (1964), 340,000 metric tons; beer, 2,820 metric tons; lumber, 65,000 cubic meters.

Crops (metric tons, 1964-65 crop year): Rice, 264,000.

Minerals (metric tons, 1964): Bauxite, 2,508,000 (ranks 4th among world producers); manganese, 118,756 (rank, 15th); gem diamonds, 60,000 carats (rank, 13th); gold, 2,111 troy ounces.

Foreign Trade (1964): Exports, \$95,000,000 (chief exports, 1961: cane sugar, unrefined, \$33,200,000; bauxite and concentrates, \$23,700,000; rice, \$13,200,000); imports, \$87,000,000 (chief imports, 1961: nonelectrical machinery, \$15,900,000; petroleum products, \$7,500,000; textiles, yarn, fabrics, \$6,500,000). Chief trading partners (1961): Great Britain (took 25% of exports, supplied 38% of imports); U.S. (took 21% of exports, supplied 20% of imports); Canada (took 26% of exports, supplied 7% of imports).

Transportation: Roads (1964), 879 miles (231 paved); motor vehicles (1964), 15,200 (automobiles, 10,600); railways (1963), 79 miles; airline, British Guiana Airways Corp.

Communications: Telephones (1964): 10,100; radios (1963), 40,000; newspapers (1962), 4 (daily circulation, 48,000).

Guyana. At a 17-day conference held in London in November, it was agreed that the colony would become the independent nation of Guyana on May 26, 1966. The new country will retain the proportional electoral system under which Premier Burnham's moderate government replaced the leftist

PICTORIAL PARADE

government of Cheddi Jagan in 1964. Jagan and the PPP boycotted the conference.

Government. Premier Burnham named Peter D'Aguiar, head of the UF, minister of finance in his 12-man cabinet, a move that helped strengthen the coalition government. Jagan and the 23 other PPP members boycotted the Assembly for five months.

Economy. The government began work on a five-year economic development plan, and on a crash program of public works in rural areas. The United States, Britain, and Canada agreed to give economic aid for the program.

A small sugarcane crop and falling prices on the world market hurt British Guiana's economy in 1965. Rice exports also dropped because Cuba, formerly a major customer, stopped buying rice after the 1964 elections ousted the Jagan government.

BRITISH HONDURAS

Premier George Price and the People's United party were returned to power on March 1, 1965, in the first elections held under the 1963 constitution that gave the country internal self-government.

Elections. Campaigning on a platform of complete and early independence from Britain, Premier Price easily defeated Philip Goldson, leader of the National Independence party, in the March elections. Goldson advocated that independence be postponed until the country achieved greater economic progress. He and one other member of the National Independence party won seats in the 18-member House of Representatives.

Area: 8,867 square miles.

Population: 106,000 (July 1, 1965, est.).

Chief Cities (1960 census): Belize, the capital, 32,690; Stann Creek, 5,287; Corozal, 3,171; Orange Walk, 2,157.

Government: Governor General, Sir Peter Stallard; premier, George Price. **Parliament**—National Assembly, 26 members; Senate, 8 members (appointed by the governor); House of Representatives, 18 members; party seating (1965): People's United party, 16; National Independence party, 2.

Religious Faiths: Roman Catholics, 60% of population; others, 40%.

Education: Literacy rate (1960)—87% of population aged 15 and over. Total school enrollment (1962)—28,036 (primary, 25,893; secondary, 1,980; teacher-training, 34; technical, 129).

Finance (1964 est.): Revenues, \$5,800,000; expenditures, \$6,500,000; public debt (1962), \$3,200,000; monetary unit, British Honduras dollar (\$B\$1.429 equal U.S.\$1).

Cost of Living Index: (1964), 104 (1958=100).

Manufacturing: Sugar (1964), 40,000 metric tons; lumber (1963), 41,000 cubic meters.

Crops (metric tons, 1964): Oranges, 32,000; grapefruit, 12,000. **Foreign Trade** (1963): Exports, \$13,000,000 (chief exports, 1962: sugar, unrefined, \$2,694,000; mahogany lumber, \$1,103,000; fruits, \$983,000; chicle, \$274,000); imports, \$19,000,000 (chief imports, 1962: milk and cream, \$794,000; automobiles, \$694,000; clothing, \$687,000). Chief trading partners (1962): U.S. (took 30% of exports, supplied 48% of imports); Britain (took 43% of exports, supplied 25% of imports).

Transportation: Roads (1964), 1,084 miles (199 paved); motor vehicles (1964), 2,622 (automobiles, 1,512).

Communications: Telephones (1964): 992,000; radios (1963), 6,000; newspapers (1962), 2 (daily circulation, 5,000).

New Capital Planned. Plans for a new capital city to replace Belize were announced on March 31 by British Colonial Secretary Anthony Greenwood. The new capital will be situated 50 miles inland from Belize, which was badly damaged by hurricanes in 1961. Grants and loans from Britain will supply most of the \$112 million needed for the new city.

Sovereignty Dispute. Guatemala and Britain, both claiming sovereignty over British Honduras, agreed in 1965 to accept United States mediation to settle the dispute. Bethuel M. Webster, a lawyer, was appointed mediator. Preliminary talks began in Washington, D.C., in November.

Budget. The 1965 budget totaled \$11,529,000. A \$5,110,000 deficit was paid by Britain. Government salaries, the largest budget item, included 70% of the nation's salaried workers.

THE BUDGET DOLLAR

Fiscal year 1966 est.

Where it comes from

Where it goes

The Wall Street Journal

BUDGET, U.S.

Net receipts of the federal government in the fiscal year ended June 30, 1965, amounted to \$93,044,443,313, compared with \$89,458,664,071 in the fiscal year ended June 30, 1964. Net expenditures were \$96,518,462,919 in fiscal year 1965, as against \$97,684,374,794 in fiscal year 1964. The 1965 budget deficit was \$3,474,019,605, as compared with the 1964 deficit of \$8,225,710,723, a reduction of almost 60%.

Both receipts and expenditures showed a substantial improvement over the estimates made in January 1965. Receipts were \$1.8 billion higher than the January estimate and expenditures were \$1 billion lower, reducing the administrative budget deficit by \$2.8 billion, or nearly half the amount of the earlier estimate. The 1965 deficit of \$3.5 billion was the smallest administrative budget deficit in five years. Administrative budget expenditures in fiscal year 1965 were over \$1 billion less than in fiscal year 1964—the first year-to-year reduction of expenditures in five years. The reduction reflected the efforts of government agencies, at President Johnson's direction, to make increased economies in operations. In spite of the income tax reduction in 1964, tax collections in 1965 were higher than in 1964, largely due to the nation's increased economic activity.

Public Debt. The total public debt and guaranteed obligations of the federal government on June 30, 1965, amounted to \$317,864,225,033, compared with \$312,525,891,182 at the close of fiscal year 1964. Interest payments on the public debt amounted to \$11,345,312,422 in 1965, compared with payments of \$10,665,858,126 in the previous fiscal year. The per capita debt was \$1,633.34 at the end of fiscal year 1965, compared with \$1,626.73 at the end of fiscal year 1964.

Receipts and Payments. The flow of money between the public and the federal government (see Table 1) is sometimes called the consolidated cash budget. To derive the total receipts and payments, transactions of trust funds are consolidated with budget transactions. Transactions between them, such as interest paid by the Treasury Department to trust funds, are eliminated, along with some other noncash transactions. For example, interest that accrues on savings bonds is counted as a budget expenditure at the time of accrual, but because the interest is not paid in cash until the bond is redeemed, the consolidation eliminates the interest accruals and includes the interest paid on redeemed bonds. As a result, the figures in Table 1 are not the same as the figures for Treasury cash deposits and withdrawals as presented in the daily treasury statement. Government transactions with commercial banks are not included in Treasury cash deposits and withdrawals, but are reflected in Table 1.

TREASURY INFORMATION SERVICE

BUILDING AND CONSTRUCTION

Activity in the new construction continued to increase in 1965, as it has since 1960, but not as much as the country's economic growth in general. A 3% gain over 1964 boosted spending for construction to \$68.1 billion in 1965—a record high—but, because costs increased between 2 and 3%, the physical volume of work put in place registered only a nominal increase over 1964.

Except for new housing, a spurt in the number of construction projects begun in 1965 left an unusually large volume of work to be completed in 1966. Unemployment rates in the industry, generally higher than for the economy as a whole, declined rapidly during the year, nearing the 5% mark.

Because new residential construction outlays failed to increase significantly, the upward trend in privately owned construction was only 4%. Public construction showed a slightly smaller rate of gain—2%—with an almost even mixture of gains and losses. Nevertheless, a net increase of over \$300 million brought public spending over the \$20 billion mark for the first time.

Private Construction. Private construction, which in 1965 totaled almost \$48 billion, showed an increase of \$2 billion during the year. There was an increase of 12% for all types of nonresidential buildings, and of 6% for public utilities.

In spite of a drop in starts, the amount spent for new housing units in 1965—\$20.7 billion—was slightly higher than in 1964, largely because more of the starts were of the high-priced single-family type. The 1,495,000 private new farm and nonfarm units started represented a drop of about 60,000 from 1964.

The market for new homes, however, was somewhat stronger in 1965 than the number of starts indicated. One-family home sales increased, and the inventory of unsold homes decreased. Mortgage money was in adequate supply, despite the inching up of interest rates. While vacancy rates were stable, foreclosures continued to increase slightly. Conventional financing was still dominant, providing funds for five sixths of all starts.

In industrial construction, a 21% gain brought spending to a new high of over \$4 billion—\$700 million more than in 1964.

Commercial construction had its greatest increase in a decade—14%. Within this group, stores and shopping centers led with 26% higher outlays, while office buildings and warehouse construction showed only a nominal 4% gain. The office building group showed the smallest overall gain in 15 years.

Public utilities construction accelerated more than in most years. Of its leading categories, telephone construction was up 13%, and electric power construction was up 8%.

Public Construction. Increased federal aid for such facilities as schools and hospitals contributed to a gain of over \$300 million (up 2%) in publicly owned construction. New classroom construction was up \$368 million, with total outlays reaching \$3.7 billion. Of the other leading categories, public hospital construction was up 13%, and public residential construction was up 21%.

Highways, still the largest public construction category, dropped to \$7.1 billion—a decrease of 1%, due to a toll road expenditure decline. Progress on the interstate highway program continued about as scheduled. Sewer and water outlays declined, but the largest decline—15%—was in public administra-

tion and service buildings.

Building Permits and Regional Trends. The 1965 permit valuation statistics, covering 3,000 places, showed the Western states to have dropped 8% from 1964—the only region to register a decline. The South and North-Central areas showed 4 and 7% gains, respectively; and the Northeast was up 12%.

The mainstays of construction in places covered by permit systems were industrial and office buildings and stores. In all regions except the South, the valuation of office space permits was up in 1965 by more than 33%.

The surge in industrial building was indicated by the building permit valuations of 1965, which were up 16% nationally. Most of this increase was in the North Central states.

Only about half of the states showed an increase in new permit valuations in 1965, whereas in 1964 all but a few states were doing better than the year before. The largest gainers were states with a relatively small volume of permits—Vermont, West Virginia, New Hampshire, Hawaii, and Delaware, which had gains of from 27 to 63%. Kansas and Arizona, with about one third declines, showed the largest losses. California, with permits valued at about one fifth of the U.S. total, was down by 8%.

Costs and Prices. Overall construction costs in 1965 rose by about 3%, mainly because of rising wage costs. Building materials prices also crept up for the first time since 1960. The overall favorable price picture was marred only by strong price pressures in the metal products area because of greater military requirements for Vietnam.

Employment and Earnings. Employment in contract construction continued its upward course throughout 1965. The gain of about 4% was due mainly to increased employment by building contractors. Virtually no employment rise was shown by highway contractors.

Average hourly earnings for all construction workers rose by 4%. Consequently, although the weekly hours for working remained unchanged, average weekly earning increased.

BULGARIA

In 1965, the pro-Soviet leaders of the Bulgarian Communist party crushed a conspiracy led by nationalists and pro-Chinese elements. The country retained close ties with the USSR, but relations with the United States continued to be strained. During the year Bulgaria's economic position improved.

Antigovernment Conspiracy. An attempted coup d'état against the government that involved government officials and army officers of high rank was revealed in April. Ivan Todorov-Gorunya, a member of the Communist party's Central Committee, shot himself fatally shortly before the police attempted to arrest him. Among those arrested were Gen. Tsvetko Anev, commandant of the Sofia military district, and Tsolo Krustev, a specialist in African-Asian affairs in the Foreign Ministry.

Premier Todor Zhivkov responded sharply to rumors that the conspirators wished to loosen ties between Bulgaria and the Soviet Union. In a speech on April 28 he said: "In the West, at this moment, the reactionaries are screaming about a plot to separate us from the Soviet Union. . . . There is no

EASTFOTO

force that can do that." In a speech on May 8 the premier branded the plotters as "contemptible adventurers, careerists, and unprincipled power-seekers."

In spite of these pronouncements, the nature of the conspiracy remained obscure. Apparently the two anti-Soviet factions within the party—one favors more independence for Bulgaria, and the other supports Communist China—united to instigate the plot to seize control from Zhivkov, a faithful adherent to the Moscow line. This assumption was dispelled somewhat on July 16, when Premier Zhivkov told five visiting Austrian journalists that the plotters were pro-Chinese; he did not mention the other faction.

The convicted conspirators received surprisingly light sentences. On June 19, Anev was sentenced to 12 years and Krustev to 15 years in prison. Seven other persons were sentenced to terms of from 3 to 15 years.

After these events, the political security apparatus was reorganized. In July, a State Security Committee was established as a special government agency under direct control of Premier Zhivkov.

Foreign Relations. The close ties between the Soviet Union and Bulgaria were strengthened in 1965 by the victory of Premier Zhivkov over the anti-Soviet conspirators. In January, Bulgaria and the USSR signed an agreement on cultural and scientific cooperation for 1965–66. It emphasized scientific cooperation but also encompassed publishing, radio, television, athletics, and higher education. Travel visas between citizens of the two countries were abolished in May. In the same month, Bulgarian President Georgi Traikov visited Moscow, and in June, Mikhail Suslov, a member of the Soviet Presidium, visited Sofia.

Bulgaria made some efforts to improve relations with the West, although these moves were mostly restricted to cultural affairs and foreign trade. In February, Deputy Premier Stanko Todorov, during a visit to France, praised President Charles de Gaulle's call for negotiations to end the war in Vietnam and said that Bulgaria and France "have no serious divergencies" on international problems.

Relations between Bulgaria and the United States deteriorated further. On February 15, several hundred Asian and African students demonstrated in Sofia against United States air strikes in Vietnam. Rocks were thrown at the United States legation. The United States charged that the police deliberately delayed in putting down the riot. On March 6, daylong anti-American rallies were held with apparent government support. On May 3, Purvan Chernev, head of the Foreign Ministry's Americas department, said that the safety of United States diplomats could not be guaranteed because of deep public resentment against American policies. On May 17, Foy D. Kohler, the U.S. ambassador to the Soviet Union, walked out of a reception in Moscow honoring Bulgarian President Georgi Traikov after the latter attacked United States policies in Vietnam and the Dominican Republic.

Trade. Bulgaria increased exports of manufactured goods in 1965—a remarkable change for a country that in the past exported only agricultural products. Bulgarian machinery was exported primarily to the Soviet Union and other East European

EUROPE

ASIA

AFRICA

Area: 42,729 square miles.

Population: 8,144,000 (July 1, 1964 est.).

Chief Cities (1963 est.): Sofia, the capital, 724,600; Plovdiv, 198,200; Varna, 161,800; Ruse, 117,500.

Government: President of the Presidium (since April 23, 1964)—Georgi Traikov; Premier (since Nov. 19, 1962) and Communist Party First Secretary—Todor Zhivkov. Parliament—National Assembly, 321 members, all belonging to the Fatherland Front.

Religious Faiths: Eastern Orthodox Church, 80% of population; Muslims, 10%; Roman Catholics, 1%.

Education: Literacy rate (1956)—85% of population aged 15 and over. Total school enrollment (1962)—1,500,260 (primary, 1,123,029; secondary, 157,695; technical, 134,671; higher, 84,720).

Finance (1965 est.): Revenues, \$1,404,000,000; expenditures, 1,404,000,000; monetary unit, lev (1.17 leva equal U.S.\$1).

states, but new markets were opened in underdeveloped countries. In 1965, Bulgaria delivered and installed two complete industrial enterprises in Indonesia. On Dec. 28, 1964, Bulgaria and the Soviet Union signed an agreement to increase trade between them by 20% over 1964; trade with the USSR accounted for 55% of Bulgaria's foreign commerce in 1965.

Economy. In 1964, industrial production increased by 11.1% over 1963, an overfulfillment of the economic plan by 3.2%. Agricultural production rose 8.6%; grain production was up 15%, but the production of fruits and vegetables declined, and the number of cattle, sheep, and poultry fell. Capital investments rose 6.7%, national income 6%, and the average industrial wage, 2.3%. The economic plan for exports was surpassed by 8.4%, and that for imports by 9.1%.

Bulgaria's economic planners hoped to raise industrial production by 9.8% in 1965. The 1965 plan also envisaged a 7.7% increase in national income, mostly as a result of increased labor productivity.

It now appears that Bulgaria will adopt the new economic policy of the Soviet Union, Czechoslovakia, and East Germany, by transferring the responsibilities of economic planning from central government organs to the enterprises themselves. State-owned enterprises will have greater control over their own funds; they will be able to regulate the pay received by workers, and will be able to contract directly with commercial organizations.

Enterprises will choose "production committees" resembling the Yugoslav workers' councils. These committees will make decisions that will be binding on the directors of the enterprises.

BURMA

The goal of political unity continued to elude Burma's rulers in 1965, although there was apparently no immediate threat to General Ne Win's military regime. His government failed to register any major economic progress, but it did continue its policy of neutrality in world politics.

Political Dissent. Outwardly the Ne Win government appeared to be one of the most stable states in otherwise sorely troubled Southeast Asia. However, the government's efforts to expand its control over Buddhist monks led to acts of violent protest. Buddhist monks attacked the headquarters of the Burma Socialist Program party, the only political organization permitted in the country. Nearly 92 monks were arrested on charges of using religion for political purposes.

PRESIDENT OF BURMA, Gen. Ne Win (right), receives a silver cigarette case from East Pakistan's Governor Monem Khan (left) during his visit to East Pakistan in February.

The roundup of the monks was followed by the arrest of about 80 former politicians. Most of them were members of banned political parties, including the party of ex-Premier U Nu, who was ousted by Gen. Ne Win in March 1962 and who is still held in detention. Some police and economic officials also were arrested, as well as Ne Win's onetime chief deputy, Brigadier Aung Gyi. These detentions suggested the persistence of hard-core opposition, but no immediate threat to the regime.

Efforts by the government to eradicate the many various insurgent groups in the country continued,

Population: 24,229,000 (July 1, 1964 est.).
Chief Cities (1963 est.): Rangoon, the capital, 687,708; Mandalay, 212,873; Moulmein, 115,931.
Government: Chairman of the Revolutionary Council—General Ne Win (assumed power after a coup d'état on March 2, 1962); Revolutionary Council (15 members).
Religious Faiths: Buddhists, 85% of population; Roman Catholics, 1%; others, 14%.
Education: Literacy rate (1954), 58% of population aged 16 and over. Total school enrollment (1961)—1,926,612 (primary, 1,602,416; secondary, 306,988; teacher-training, 675; technical, 2,933; university, 13,600).
Finance (1965 est.): Revenues, \$417,000,000; expenditures, \$330,000,000; monetary unit, kyat (4.7619 kyats equal U.S.\$1).
Gross National Product (1964): \$1,620,000,000.
National Income (1964): \$1,363,000,000; average annual income per person, \$56.
Economic Indexes: Agricultural production (1964), 120 (1956=100); cost of living (1963), 99 (1958=100).
Manufacturing (metric tons, 1964): Petroleum products (1963), 598,000; cement, 131,000; sugar, 67,000; cotton yarn, 5,000.
Crops (metric tons, 1963): Rice, 7,457,000 (ranks 7th among world producers); peanuts, 321,000 (world rank, 9th); natural rubber, 9,000 (world rank, 12th); chick-peas (1964-65), 77,000; sesame (1964-65), 71,100; tobacco, 43,700; cotton seed, 35,000; dry peas (1964-65), 13,000.
Minerals (metric tons, 1964): Lead, 18,950 (ranks 20th among world producers); tin, 660 (world rank, 18th); nickel, 64 (world rank, 15th); silver, 1,355,000 troy ounces (world rank, 20th); salt, 127,000; zinc, 8,100; crude petroleum, 4,277,000 barrels.
Foreign Trade (1964): Exports, \$239,000,000 (chief export, rice, \$148,000,000); imports, \$272,000,000 (chief imports, 1962: textile yarn and fabrics, \$53,200,000; nonelectrical machinery, \$23,600,000; iron and steel, \$14,100,000). Chief trading partners (1962): Japan (took 5% of exports, supplied 23% of imports); Great Britain (took 10% of exports, supplied 15% of imports); Communist China (took 7% of exports, supplied 13% of imports).
Transportation: Roads (1964), 15,535 miles (4,205 paved); motor vehicles (1964), 65,000 (automobiles, 30,000); railways (1963), 1,906 miles; merchant vessels (1964), 9 (48,000 gross registered tons); national airline, Union of Burma Airways; principal airport, Rangoon.
Communications: Telephones (1964), 20,828; radios (1963), 203,000; newspapers (1962), 31 (daily circulation, 202,000).

but without spectacular success. As many as 10,000 rebels of assorted ideological and ethnic complexion were waging guerrilla warfare. The most serious threat to the government seemed to be the "Shan National Army," a group who reflected the resentment of the important regional minority in Shan State against alleged high-handed treatment by the Burmese majority. The once formidable "White Flag" Communists probably numbered no more than 1,000 men in 1965.

"Burmese Way to Socialism." Full nationalization of the economy remained the aim of the military government as it continued to pursue its "Burmese Way to Socialism" program. The government expropriated a number of foreign firms, including Burma Corp. Ltd., the nation's largest mining combine, and Unilever Ltd., a British soap-making firm. Public works battalions were formed to take over government construction contracts held by private firms. The government's agrarian revolution was boosted by the abolition of approximately \$3 million worth of land rents previously paid by farmers for cultivating rice lands. The government also began to assume control of private schools throughout the country.

Economy. Economic performance under the Ne Win government continued to be disappointing. Figures for 1964 (released in mid-1965) showed that the gross national product declined by more than 6%, returning to its 1961-62 level. Agricultural output dropped by 5%, industrial production by 11%, and trade by 13%. Unemployment and consumer goods shortages, occasioned by wholesale nationalization measures in March-April 1964, were somewhat alleviated after the private sector was allowed to share the distribution of consumer goods with state shops.

Foreign Policy. Burma continued its policy of non-alignment in foreign affairs, dealing both with Communist and non-Communist countries. For example, the government in 1965 agreed to buy \$5 million worth of textile mills from Communist China. On the other hand, a quarter of its foreign loans contracted for the 1965-66 fiscal year were from Japan. Gen. Ne Win visited the Soviet Union, India, and Pakistan in 1965. He continued to pursue policies supporting general and nuclear disarmament, a "Geneva-type" settlement of the Vietnamese problem, and a reconciliation between Indonesia and Malaysia.

Relations between Washington and Rangoon remained cool. However, Burma and the United States signed an agreement providing for U.S. financing to construct a modern teak mill.

BURUNDI

As 1965 opened the political situation in Burundi was appraised by most foreign observers in terms of the struggle for influence between Communist China and Western elements. The year was also marked by rivalry between the Watusi (or Tusi) aristocracy and the Bahutu (or Hutu) peasantry.

Assassination. The cabinet led by Albin Niamoya, under whose premiership Burundi had established closer relations with Communist nations, was replaced on Jan. 7, 1965. The new cabinet was headed by former Premier Pierre Ngendandumwe, a Bahutu moderate, who was committed to neutralism in international relations and to intercommunal harmony in

BURUNDI · Information Highlights

Area: 10,747 square miles.
Population: 2,780,000 (mid-1964 est.).
Chief Cities (1960 est.): Bujumbura, the capital, 47,036.
Government: King—Mwambutsa IV (b. 1909; acceded, 1915);
Prime Minister—Léopold Biha (took office Sept. 30, 1965);
Parliament—Senate, 16 members; National Assembly, 33 members; party seating (1965): Union of National Progress, 21; People's party, 10; Independents, 2.
Religious Faiths: Roman Catholics, 56% of population; others, 44%.
Education: Total school enrollment (1962)—114,115 (primary, 110,045; secondary, 1,242; teacher-training, 1,393; technical, 1,384; higher, 51).
Finance (1963): Revenues, \$3,000,000; expenditures, \$4,000,000; monetary unit (1965), Burundi franc (87.50 francs equal U.S.\$1).
Crops (metric tons, 1964-65 crop year): Green coffee, 12,000.
Minerals: Tin ore (1964), 16 metric tons; columbium and tantalum concentrate (1962), 2,000 kg.
Transportation: Principal airport, Bujumbura.
Communications: Telephones (1964): 2,300.

domestic affairs. On January 15, however, Premier Ngendandumwe was assassinated. Although Western rumors of Communist Chinese complicity in the murder were denied in Bujumbura, the capital, the government suspended diplomatic relations with Peking. Joseph Bamina succeeded to the premiership.

Elections. After King Mwambutsa IV dissolved the 33-member National Assembly in March, assembly elections were held on May 10. All of the leading Watusi figures in the UPRONA party associated with the Niamoya regime, except Niamoya himself, were defeated.

Internal Dissension. Following the elections, communal tensions, already inflamed by the murder of Premier Ngendandumwe, prevented the new government from functioning. On July 27, King Mwambutsa IV returned to Burundi after a four-month absence and took personal charge of the government.

In mid-September the king appointed Léopold Bihumugani (alias Biha), a staunch traditionalist, to head a new cabinet. Biha's policies were viewed with distrust by Bahutu leaders, and on October 19 an attempted uprising by radical Bahutu elements of the army nearly cost Biha his life. After the insurrection had been crushed, reprisals were carried out against Bahutu intellectuals and their political organization, the People's Party.

Economy. Political unrest had an adverse effect on Burundi's economy. In February the Burundi franc was devalued to 87.50 francs to the U.S. dollar. Economic and social problems caused by the presence of nearly 80,000 refugees in Burundi (mostly Watusi from Rwanda) were relieved somewhat by \$1.3 million donated by the United Nations.

CALIFORNIA

Legislative reapportionment, another record budget, demonstrations at the state university, and a controversy over agricultural labor highlighted the events of 1965 in California.

Reapportionment. Under a court order to reapportion both its Senate and Assembly, the California Legislature, in the second special session of the year, finally, and reluctantly, came up with a reapportionment plan in October. The plan eliminated 14 northern senators and transferred control of the legislature to the southern part of the state. After legislative elections are held in 1966, eight southern counties will hold 46 of the 80 assembly seats and 22 of the 40 senate seats. Los Angeles County, which now has one senator, will have 14½ (sharing one with neighboring Orange County.)

Budget. The Legislature approved a record \$4.17 billion budget for fiscal year 1966, up more than \$500 million from fiscal year 1965. It failed, however, to adopt proposed tax reforms. In its first special session, which began on June 25, the Legislature adopted a \$107 million tax measure to make up the deficit between state revenues and budgeted expenditures. The bill provided for an extension of the sales tax and a speed-up in collection of sales taxes from large business concerns.

Student Demonstrations. Demonstrations by students of the Free Speech Movement at the Berkeley campus of the University of California in late 1964 succeeded in getting university authorities to relax restrictions on political activity on campus. (In July 1965, however, over 600 persons were convicted of trespassing and resisting arrest during the December 1964 "sit-in" at Berkeley.) The FSM was replaced in 1965 by what was termed a "filthy speech movement," and nine persons were arrested on obscenity charges. About mid-year the demonstrations became political protests against United States policies regarding the Dominican Republic and Vietnam.

After Edward W. Strong, chancellor of the University of California, resigned as a result of the FSM demonstrations, a special committee was ap-

Area: 158,693 square miles.

Government: Chief Officers—governor, Edmund G. Brown (D); lt. gov., Glenn M. Anderson (D); secy. of state, Frank M. Jordan (R); atty. gen., Thomas C. Lynch (D); treas., Bert A. Betts; supt. of pub. instr., Max Rafferty; chief justice, Roger J. Traynor. **Legislature**—California Legislature (convened Jan. 4, 1965); Senate, 40 members (24 Democrats, 14 Republicans, 2 vacancies); Assembly, 80 members (49 Democrats, 31 Republicans).
Education: School enrollment (1964-65)—public elementary, 2,950,000 pupils (89,000 teachers); public secondary, 1,575,000 pupils (59,000 teachers); nonpublic schools, 448,900 pupils (13,730 teachers); college and university (fall 1964), 789,330 students. **Public school expenditures** (1964-65)—\$3,250,000,000 (\$570 per pupil); average teacher's salary, \$7,900.
Public Finance (fiscal year 1965): Revenues, \$3,260,987,810 (sales tax, \$939,649,277; motor fuel tax, \$508,930,524; federal funds, \$2,646,290). **Expenditures**, \$3,329,944,487 (education, \$1,367,488,103; health, welfare, and safety, \$606,438,254; highways, \$733,635,487). **State debt**, \$3,422,849,000 (June 30, 1965).
Personal Income (1964): \$56,122,000,000; average annual income per person, \$3,103.
Public Assistance (fiscal year 1965): \$891,422,718 to 944,535 recipients (aged, \$360,704,281; dependent children, \$298,458,457).
Labor Force (employed persons, July 15, 1965): Agricultural, 337,000; nonagricultural (wage and salary earners), 5,787,200 (24.6% manufacturing, 22.2% trade, 18.8% government). **Unemployed persons** (July 15, 1965)—441,000.
Manufacturing (1963): Value added by manufacture, \$17,157,242,000 (transportation equipment, \$2,742,346,000; primary metals, \$592,451,000; nonelectrical machinery, \$1,078,390,000; electrical machinery, \$2,162,756,000; fabricated metals, \$1,059,871,000; food and products, \$2,452,211,000; printing and publishing, \$819,511,000).
Agriculture (1964): Cash farm income, \$3,654,015,000 (livestock, \$1,320,690,000; crops, \$2,299,271,000; govt. payments, \$34,054,000). **Chief crops** (tons)—hay, 7,696,000 (ranks 3rd among the states); sugar beets, 7,157,000 (rank, 1st); alfalfa, 6,376,000 (rank, 2nd); grapes, 3,165,000 (rank, 1st); barley, 1,726,000 (rank, 2nd); citrus fruits, 1,668,000 (rank, 2nd); potatoes, 1,365,000 (rank, 3rd); peaches, 1,190,000 (rank, 1st); rice, 801,000 (rank, 4th); cottonseed, 725,000 (rank, 3rd).
Mining (1964): Production value, \$1,560,510,000 (ranks 3rd among the states). **Chief minerals** (tons)—gypsum, 1,893,000 (rank, 1st); salt, 1,525,000 (rank, 6th); lime, 577,000 (rank, 9th); gold, 71,028 troy ounces (rank, 6th); silver, 172,000 troy ounces (rank, 9th); petroleum, 300,009,000 barrels (rank, 3rd); natural gas, 664,051,000,000 cubic feet (rank, 6th).
Fisheries (1964): Commercial catch, 502,464,000 pounds (\$49,926,000). **Leading species**—yellowfin tuna, 149,020,000 pounds (\$19,850,000); jack mackerel, 89,693,000 pounds (\$2,109,000); skipjack, 66,059,000 pounds (\$6,624,000); albacore, 42,551,000 pounds (\$6,580,000).
Transportation: Roads (1965), 156,007 miles (83,858 paved); motor vehicles (1965), 10,707,843; railroads (1964), 15,071 miles; airports (1965), 707.
Communications (1965): Telephones, 9,983,100; television stations (1964), 36; radio stations (1964), 336; newspapers, 132 (daily circulation in 1964, 5,503,213).

CALIFORNIA STUDENTS at Berkeley protested U.S. involvement in Vietnam war in October. Students marched toward Oakland Army Terminal, but were stopped at city limits by police.

SOUTHERN CALIFORNIA had torrential rains in late November, causing destruction to crops and to property in hilly residential areas. Here, an emergency crew assesses the damage on a Glendale street which collapsed, creating a temporary waterfall.

UPI

pointed by the university's Board of Regents to study the situation. The committee report, presented in May, recommended a sweeping reorganization of the university to give each of its nine divisions substantial independence under broad supervision by the board. In March, President Clark Kerr and Acting Chancellor Martin Meyerson resigned, but reconsidered their decision on request of the board. In July, Meyerson was replaced as chancellor by Roger W. Heyns. (See also EDUCATION.)

Agricultural Workers. The year 1965 was the first since 1951 in which Mexican braceros were not allowed to work on California farms. Many growers experienced difficulty in getting laborers to harvest crops, especially strawberries and asparagus. Because of the lack of American laborers, 300 Japanese date pickers and pollinators were authorized to work in February. In June, 3,500 more foreign workers were authorized, and high school students were hired to harvest some crops. Additional friction occurred when unions tried to organize grape pickers in central California.

Legislation. In addition to its actions on reapportionment and the budget, the California Legislature adopted a state Medicare plan that will expand the coverage of the federal program, and enacted a smog-control measure. The smog-control bill requires exhaust control devices on all cars, buses, and trucks sold in California, with dates for compliance varying from 1966 through 1968, depending on the type of vehicle. The legislature also imposed an additional 1-cent-per-gallon gasoline tax to raise money for rebuilding roads and bridges destroyed in northern California by floods in late December 1964.

Court Decisions. In May the U.S. Supreme Court denied California's claim to oil-rich land between the coast and offshore islands. The court upheld the federal government's claim to all submerged land beyond a three-mile belt along the coast and around each offshore island.

California's ban on subscription television was declared unconstitutional by a superior court judge in May. The ban was the result of an initiative measure passed by the state's voters in 1964.

The California Supreme Court heard arguments on the constitutionality of another initiative measure adopted in 1964. This measure invalidated antidiscrimination legislation in housing.

Law Enforcement. Plans were made to double the size of the highway patrol over the next three years. Recent incidents of attacks on officers led to a new policy that will equip most patrol cars with 12-gauge shotguns. Attorney General Thomas C. Lynch branded several motorcycle clubs as outlaw groups, and called for legislative action to curtail them. He also warned against the growing menace of certain extreme right-wing paramilitary groups in the state.

Property Assessment Scandals. Investigations disclosed irregularities in property assessment processes in several counties. Special favors were allegedly given by assessors to certain property owners. One assessor committed suicide.

CAMBODIA

The long-deteriorating relations between Cambodia and the United States reached a low point in the spring of 1965, and Cambodia announced a complete break in diplomatic relations on May 3. Cambodia's chief of state, Prince Norodom Sihanouk, although apparently still trying to use the American presence in Southeast Asia as a counterweight against the threat of Communist absorption, denounced the United States frequently and vigorously during the year. Yet, while drawing closer to Communist China, Sihanouk asserted that he was interested in resolving differences with the United States. His fluctuations expressed the vulnerability of Cambodia, which is situated in a part of the world where China's ambitions and America's commitments conflict.

Cambodia and the United States. Prince Sihanouk's immediate reasons for severing ties with the United States were an article in an American magazine that allegedly was disrespectful to Cambodia's queen mother, and the death of a Cambodian boy accidentally killed on April 28 in a bombing attack by American and South Vietnamese planes that had crossed the Cambodian border in pursuit of Communist Vietcong insurgents. Cambodia offered to maintain relations between Washington and Phnom Penh on the consular level, but the United States declined.

PRINCE NORODOM SIHANOUK, Cambodia's chief of state, continued in 1965 to follow a dangerous policy of playing off Communist China against the United States in an effort to preserve Cambodia's independence and keep it an "oasis of peace" in troubled Southeast Asia. By breaking relations with the United States on May 3, he struck a strong blow for China, but many observers judged that his motivation was fear of China rather than support for its policies. They reasoned that Sihanouk expected a Communist victory in neighboring South Vietnam and meant to be on the winning side when it occurred.

Sihanouk was born on Oct. 31, 1922, in Cambodia, then a monarchy under French control. Elected king in 1941, he submitted to Japanese puppet rule during World War II. In 1955, when Cambodia won its independence, Sihanouk gave his throne to his father and became premier. After his father's death, he again renounced the throne—in favor of his mother—and took the title of chief of state on June 20, 1960.

Sihanouk's attitude toward the United States continued to be ambivalent. While repeatedly demanding that the United States abandon its struggle against the Communists in South Vietnam, he also declared that its withdrawal would leave Cambodia "face to face with Vietnamese communism, the most terrible kind." The prince urged the Communists to give the West "solid guarantees" that any Vietnamese settlement would endure. He reportedly favored a continued American presence in the Philippines and Thailand to balance Communist strength in the area.

International Diplomacy. The difficulty of Sihanouk's position was illustrated by the Indochinese People's Conference, to which his government was host in Phnom Penh from March 1 to 9. Thirty-eight political movements in Cambodia, Laos, and Vietnam were represented, including such Communist bodies as North Vietnam's Fatherland Front, South Vietnam's National Liberation Front, and the Laotian Neo Lao Hat Xat, the political arm of the insurgent Pathet Lao. The conference called for American withdrawal from Vietnam and new international talks on Cambodia and Laos. Sihanouk probably had intended to use the meeting to make Vietnamese peace proposals that might have been acceptable to non-Communists, but the conference ended as an almost wholly pro-Communist affair.

WIDE WORLD

CAMBODIA'S PRINCE SIHANOUK (right) welcomes Indonesia's President Sukarno, who arrived in Phnom Penh to attend the Indochinese People's Conference, March 1-9.

Sihanouk's proposal for an international conference to guarantee Cambodian neutrality represented another failure of his foreign policy. The Soviet Union, cochairman with Britain of the 1954 and 1961-62 Geneva Conferences on Indochina and Laos, respectively, at first endorsed the conference, but subsequently reneged after the United States, Britain, and other Western nations reluctantly accepted it.

Relations with Its Neighbors. Border incidents with South Vietnam and Thailand further disturbed already strained relations between Cambodia and its most important immediate neighbors. Prince Sihanouk vigorously denied that he was aiding the Vietcong, but, with or without his assistance, the Vietcong sought sanctuary across the Cambodian frontier when pursued by South Vietnamese government forces. The situation caused many troublesome incidents, including that of April 28 which precipitated the U.S.-Cambodian break. The most serious border clash with Thailand occurred on June 20 when 14 Cambodian soldiers and a Thai police officer were killed.

CAMBODIA · Information Highlights

Area: 69,898 square miles.
Population: 6,200,000 (mid-1964 est.).
Chief Cities (1962 prelim. census): Phnom Penh, the capital, 403,500; Battambang, 25,000; Kompong Chhnang, 20,000; Kompong Cham, 15,000.
Government: Queen—Sisowath Kossamak (accessed 1960); chief of state—Prince Norodom Sihanouk (took office June 20, 1960); premier—Prince Norodom Kantol. **Parliament**—National Assembly, 62 members (all belonging to the Popular Socialist Community); Council of The Kingdom, 24 members.

Crops (metric tons, 1964): Rice, 2,574,000 (ranks 14th among world producers); rubber, 45,800 (rank, 7th); maize, 220,000; bananas, 160,000; dry beans, 12,000; soybeans, 11,000; jute, 5,000.
Minerals: Salt (1962), 40,000 metric tons; gold (1964), 6,000 troy ounces.
Foreign Trade (1964): Exports, \$88,000,000 (chief exports, 1963: rice and rice products, \$46,800,000; rubber, \$23,000,000; maize, \$6,900,000; kapok, \$1,600,000); imports, \$82,000,000 (chief imports, 1963: iron and steel manufactures, \$10,200,000; nonelectrical machinery, \$8,400,000; cotton goods, \$8,100,000). Chief trading partners (1963): France (took 26% of exports, supplied 18% of imports); Hong Kong (took 10% of exports, supplied 20% of imports); Singapore (took 10% of exports, supplied 9% of imports).
Transportation: Roads (1964), 3,181 miles (1,354 paved); motor vehicles (1964), 20,000 (automobiles, 12,500); railways (1963), 240 miles; national airline, Royal Air Cambodia; principal airport, Phnom Penh.
Communications: Telephones (1964): 3,875; television sets (1963), 1,000; radios (1959), 9,900; newspapers (1962), 11 (daily circulation, 48,000).

MILITARY AID from China exemplifies close Cambodian-Chinese ties. Prince Sihanouk (r.), with Chinese ambassador and his wife, inspects display of small arms weapons.

Internal Politics. Despite the worsening war in adjacent South Vietnam and the protracted Communist-instigated civil strife in Laos immediately to the north, the Sihanouk government retained its remarkable stability in Cambodia. The indigenous Communist movement was very weak, but Prince Sihanouk nonetheless felt moved to rebuke the Communists for their obstructionist tactics in the legislature and for their antigovernment propaganda. Opposition to Sihanouk was most evident in the activities of the rebel Khmer Serei movement, which beamed anti-Sihanouk broadcasts from Thailand and South Vietnam.

RICHARD BUTWELL
Director, Patterson School of Diplomacy
University of Kentucky

CAMEROON

Cameroon's presidential elections, held on March 27, 1965, resulted in the reelection of President Ahmadou Ahidjo and Vice President John N. Foncha. The Ahidjo-Foncha ticket ran unopposed and garnered 99.95% of the total votes cast.

In June, legislative elections in the Western and Eastern regions confirmed the hold of the dominant parties on both parts of the federation. In West Cameroon, the Kamerun National Democratic party (KNDP) ran unopposed, as did the Union Camerounaise (UC) in the East. The KNDP and the UC together make up a single—and the only—political group in the Cameroon National Federal Assembly.

Government Changes. Because the constitution prohibits holding state and federal offices simultaneously, Vice President Foncha, who since 1961 had been both prime premier of West Cameroon and vice president of the federal republic, resigned the former position after his reelection as vice president. On May 12, President Ahidjo announced the appointment of Augustin Ngom Jua, cofounder of the KNDP, as premier of West Cameroon—a move that caused some stress in party circles. A week later ten prominent members of the KNDP, including S.T. Muna, Jua's main opponent and a federal minister, were suspended from the party for disciplinary reasons. In August, Vincent de Paul Ahanda, former Cameroon ambassador to Belgium, was made premier of Eastern Cameroon, replacing Charles Assalé.

Release of Prominent Opposition Leaders. On July 10 the leaders of four opposition parties were released from prison after serving sentences since July 1962 for sedition and conspiracy. The four were André-Marie Mbida, former premier of Cameroon; Charles Okala, former foreign minister; Theodore Mayi Matip, leader of the Union des Populations du Cameroun; and Bebey Eyidi, national secretary of the Parti Travailleiste.

Economic Successes. Extraordinary economic advances have been made by Cameroon since 1960. In 1965 the National Assembly adopted the first ordinary budget to be balanced without outside aid.

(Opposite page) NEW CANADIAN FLAG flies for the first time before Parliament Buildings in Ottawa on Feb. 15, 1965.

A black and white photograph of a Gothic cathedral, likely St. Basil's Cathedral in Montreal. The image shows a large crowd of people gathered in front of the cathedral's entrance. A Canadian flag is flying on a tall pole to the left. The word "CANADA" is superimposed in large, white, bold letters across the middle of the image.

CANADA

JOHN G. DIEFENBAKER, leader of Canada's Progressive Conservative party, carried his 1965 bid for election to provincial voters in a series of spirited campaign speeches.

CANADA

Canadian affairs in 1965 were again marked by the contradictions that had prevailed throughout the previous year. Economically, Canadians were complacent as they enjoyed a fifth year of prosperity. The predicted drop in the country's long economic upswing did not occur, although there were apparent inflationary signs in the sharp rise of in-

vestments and in the construction boom. Politically, there was neither consensus nor sharp division. The mood toward the government and political parties in general was one of frustration, and this was reflected in the results of the federal elections on Nov. 8, 1965.

Despite these disparate attitudes, Canadians showed a new awareness of their responsibilities, particularly to the less affluent within their ranks. Contributory old-age pensions, Medicare, a labor code, development financing, and a domestic peace corps all had their beginnings during 1965.

POLITICAL AFFAIRS

Two successive general elections, in 1962 and 1963, produced Parliaments in which neither major party—the Liberal or the Progressive Conservative—held a majority. As a result, persistent obstruction and bitter controversy slowed the work of legislation. Then, the Rivard scandal involving government personnel erupted near the end of 1964, rousing public opinion against wrongdoing within government circles and spreading suspicion of corruption. After the third session of the 26th Parliament was ended by dissolution in September, the ensuing election returned a government that still did not have a majority.

Parliament. The second session of the 26th Parliament, beginning early in 1964 and lasting until April 3, 1965, sat for 248 days, engaging in debates that filled 13,000 pages of *Hansard*. This deluge of words was caused in part by the government's minority position, which gave the opposition an opportunity for using obstructive tactics; in part by the long argument over the new flag (settled in December 1964); and in part by bickering over the Rivard affair. The net effect was a lowering of Parliament's prestige.

The third legislative session, which opened on April 5, was also marked by acrimony. However,

CANADA · Information Highlights

Area: 3,851,809 square miles.

Population: 19,705,000 (Oct. 1, 1965, est.).

Chief Cities (1961 census): Ottawa, the capital (268,206); Montreal (1,191,062); Toronto (672,407); Vancouver (384,522).

Government: Governor General—George P. Vanier; prime minister, Lester B. Pearson. Parliament—Senate, 102 members (appointed for life); House of Commons, 265 (with party seating as of Jan. 1, 1966: Liberal, 131; Progressive Conservative, 98; New Democratic, 21; Creditiste, 9; Social Credit, 5; Independent Liberal, 1).

Religious Faiths: Roman Catholic, 45.7% of population; United Church of Canada, 20.1%; Anglican, 13.2%; Presbyterian, 4.5%; Lutheran, 3.6%; others, 12.9%.

Education: Total school enrollment (1963–64)—4,945,368 (elementary, 3,594,215; secondary, 1,192,883; college and university, 158,270), including about 38,000 Indian and Eskimo students who are maintained in a special school system provided for by the federal government.

Finance (1965 est.): Revenues, \$62,084,000,000; expenditures, \$60,135,000,000; public debt (1964), \$240,000,000; monetary unit, Canadian dollar (in 1965, 1.08 Canadian dollars equaled U.S. \$1).

Gross National Product (1964): \$43,500,000,000.

National Income (1964): \$32,500,000,000; average annual income per person, \$1,693.

Economic Indexes (1964): Industrial production (1958=100), 138; agricultural production (1956–57=100), 126; cost of living (1958=100), 108.

Manufacturing (metric tons, 1964): Crude steel, 8,283,000; cement, 7,176,000; newsprint paper, 6,624,000; wheat flour, 2,088,000; meat, 1,018,000; aluminum, 764,426; gasoline (1963), 13,839,000.

Crops (metric tons, 1964): Wheat, 16,341,000 (ranks 3rd among world producers); oats, 5,508,000 (world rank, 2nd); barley, 3,632,000 (world rank, 7th); potatoes, 2,122,000 (world rank, 16th); corn, 1,345,000 (world rank, 16th); linseed, 516,000 (world rank, 3rd); rye, 310,000 (world rank, 13th); soybeans, 190,000 (world rank, 7th).

Minerals (metric tons, 1964): Iron ore, 35,076,000 (ranks 5th among world producers); gypsum, 5,782,000 (world rank, 2nd); salt, 3,532,000 (world rank, 8th); zinc, 662,186 (world rank, 1st); copper, 448,754 (world rank, 5th); nickel, 211,512 (world rank, 1st); uranium ore, 6,272 (world rank, 2nd); petroleum, 275,364,000 barrels (world rank, 9th); silver, 30,316,486 troy ounces (world rank, 4th); gold, 3,810,738 troy ounces (world rank, 3rd); bituminous coal, 8,459,000.

Foreign Trade (1964): Exports, \$8,091,000,000 (chief exports: manufactured goods, \$1,619,000,000; wheat, \$1,041,000,000; newsprint, \$772,000,000; wood, \$661,000,000); imports, \$7,554,000,000 (chief imports, 1963: bus and auto parts, \$457,000,000; crude petroleum, \$310,000,000; agricultural machinery, \$300,000,000). Chief trading partners (1963): U.S. (took 56% of exports, supplied 68% of imports); Britain (took 15% of exports, supplied 8% of imports); Japan (took 4% of exports, supplied 2% of imports).

Transportation: Roads (1964), 505,191 miles (79,191 paved); motor vehicles (1964), 6,037,469 (automobiles, 4,788,896); railways (1963), 43,870 miles; merchant vessels (1964), 62 (266,000 gross registered tons); airline, Air Canada; principal airports (in order of size and number of passengers handled), Montreal, Toronto, and Vancouver.

Communications: Telephones (1965), 7,021,000; television stations (1964), 231; television sets (1964), 4,950,000; radios (1962), 9,200,000; newspapers (English and French, 1965), 112 (daily circulation, 4,294,924).

the government managed to introduce a fair amount of legislation, although many bills were not completed by the time of the summer recess. Parliament was dissolved in September, and an election was called for November 8.

Legislation. The budget presented by Walter Gordon, minister of finance, made few changes in taxation, except for a 10% reduction in personal income taxes. Two programs based on American models were introduced: a "war on poverty" to eliminate pockets of economic drought across the country, and a "Company of Young Canadians" to function as a domestic peace corps. A Canada Development Corporation, with an authorization of \$1 billion from government and private funds, was formed to develop Canadian industry, thereby preventing a foreign takeover of Canadian business. Gordon also revised the Bank Act, but left the maximum interest rate on bank loans at 6%.

A major item of legislation that the dissolution of Parliament in September left unfinished was the redistribution of parliamentary constituencies in accordance with the results of the 1961 census. (Under provisions of the British North America Act, this rearrangement must be carried out after each decennial census.) Previously, reorganization had been effected by a House committee, leaving the incumbent government free to use its parliamentary majority to redraw constituencies to its own advantage. However, Parliament recently decided that the population of each constituency should number as close to 70,000 as possible, with a tolerance of 25% above or below that figure. The drawing of constituency boundaries, to be done by impartial provincial commissions, was completed in all 10 provinces by midyear, and awaited parliamentary approval.

Because urban areas have grown rapidly in the past decade, reapportionment under the 1961 census meant that cities would gain representation at the expense of rural areas. Parliamentary members of all parties, therefore, found themselves in the position of having to approve new district boundaries that might eliminate their own constituencies. Consequently, the slow process of approving the new system was not completed by the time Parliament was dissolved. As a result, the November elections took place in constituencies based on 1951 populations—a condition favoring the Conservatives, who are strong in rural areas, at the expense of the Liberals and New Democrats in the cities.

Elections. There was widespread feeling that the November 8 election was unnecessary, since the Liberal government was slowly getting its measures through Parliament. The smaller parties did not want to force another election, and John Diefenbaker's Conservative party was so torn by internal dissension that many of its adherents were reluctant to support him in challenging the government. Prime Minister Lester B. Pearson's decision to call a fall election seemed to be based primarily on assurances by his party managers that the Liberals would win a comfortable majority.

During the campaign, Liberal spokesmen failed to clarify the government's plans. Moreover, all parties sidestepped major pending issues—the country's predicted financial and economic difficulties, the conflict between English and French Canada over the balance of power within confederation, and the ambiguities in Canadian-American relations. Diefenbaker conducted a forceful campaign, but Pearson was not at his best in campaign oratory.

WIDE WORLD

PRIME MINISTER LESTER B. PEARSON casts his ballot in the November 8 federal election that returned him and his Liberal party to office. Mrs. Pearson looks on at right.

Election results showed that neither the Liberals nor the Conservatives enjoyed the confidence of a majority of the people. Little more than 74% of the qualified voters went to the polls, and they elected a new Parliament in which party distribution differed little from that of the previous House of Commons. The Liberals received 40% of the vote and won 131 seats, just two short of the 133 needed for a majority. The Conservatives won 32% of the vote and 98 seats; New Democrats, 18% and 21 seats; Quebec Creditistes, 5% and 9 seats; Social Crediters, 4% and 5 seats; Independent Liberals, 1 seat.

The Liberals did well in Ontario, as expected; not quite so well as expected in Quebec; but lost badly in Nova Scotia. In the western provinces, they gained one seat in Manitoba, none in Saskatchewan or Alberta, and seven in British Columbia. It could be concluded from the election, therefore, that the Liberal government was essentially a government of central Canada, with the Conservatives representing the peripheral and rural areas, but having little support in Quebec.

The New Democrats were the only group that had reason to be pleased with the election results. They increased their percentage of the popular vote (from 15% to 18%), and in many urban areas ran second to the Liberals. Their chief disappointment was in Quebec, where they increased their vote but failed to win a single seat. The election proved to the Liberals that if they expect to win more general support, they must emphasize social welfare—the issue stressed by the New Democrats—and must build up mass support in the Prairie provinces.

Cabinet Changes. In mid-December, Prime Minister Pearson reconstructed his cabinet. Two of his ministers, J.W. McNaught of mines and technical surveys and Harry Hays of agriculture, were defeated in the election. His closest associate, Walter Gordon, who had urged him to hold an election, resigned on the ground that he had given bad advice. Two ministers involved in questionable credit purchases resigned under pressure. There were demands from the English Canadian press for the resignation of Minister of Justice Guy Favreau, who was responsible for the handling of the Rivard case, and Quebec demanded increased recognition for the new school of Quebec liberals, whose spokesman in Commons was Maurice Sauvé.

UPI

PAUL MARTIN, Canada's secretary of state for external affairs, presents his country's plea for a negotiated peace in Vietnam to the UN General Assembly on Sept. 24, 1965.

THE CANADIAN MINISTRY

(In order of precedence in the Privy Council as of Jan. 1, 1966)

Prime Minister, **Lester Bowles Pearson**
 Secretary of State for External Affairs, **Paul Martin**
 Minister of Transport, **John W. Pickersgill**
 Minister of National Defense, **Paul T. Hellyer**
 Minister of Finance and Receiver General, **Mitchell Sharp**
 Minister of Trade and Commerce, **Robert H. Winters**
 Minister of Public Works, **George J. McIlraith**
 Minister of Northern Affairs and National Resources, **Arthur Laing**
 Secretary of State of Canada, **Judy LaMarsh**
 Minister of Justice and Attorney General, **Lucien Bardin**
 Minister of Labour, **John R. Nicholson**
 Minister of Fisheries, **Hédard Robichaud**
 Minister of Mines and Technical Surveys, **Jean-Luc Pépin**
 Minister of Veterans Affairs, **Roger Tillet**
 Minister of National Health and Welfare, **Allan J. MacEachen**
 Minister of Industry and Minister of Defence Production, **Charles M. Drury**
 President of the Privy Council, **Guy Favreau**
 Minister of Citizenship and Immigration, **Jean Marchand**
 Minister of Agriculture, **John J. Greene**
 Postmaster General, **Jean-Pierre Côté**
 Minister without Portfolio and Leader of the Government in the Senate, **John J. Connolly**
 Minister of Forestry, **Maurice Sauvé**
 Minister of National Revenue, **Edgar J. Benson**
 Associate Minister of National Defence, **Léo Cadieux**
 Solicitor General, **Lawrence T. Pennell**
 Minister without Portfolio, **John N. Turner**

In the reconstructed cabinet, Guy Favreau remained in the cabinet but was shifted to the presidency of the Privy Council. Maurice Sauvé received no promotion. Jean-Luc Pépin became minister of mines and technical surveys (his department was scheduled to be reorganized in 1966 as the Department of Resources and Energy). Jean Marchand, a Quebec labor leader, became minister of citizenship and immigration (to be reorganized as the Department of Manpower). Allan MacEachen was transferred from the labor ministry to health and welfare, where he will be in charge of Medicare. Mitchell Sharp, perhaps the most impressive member of the original Pearson cabinet, was named minister of finance. Robert H. Winters, who had been out of politics since 1957, became minister of trade and commerce.

On balance, the new cabinet appeared to be the result of the government's modest shift to the left. With Walter Gordon, the party's chief economic nationalist, out of the cabinet, and with Mitchell Sharp and Robert Winters in the two major economic posts, it also looked as if the government was chang-

ing its policy from nationalist protectionism to economic "continentalism."

The Rivard Affair. The effectiveness of the Liberal government was undermined during 1965 by an unsavory affair involving members of its party. The cause of the scandal was Lucien Rivard, a French-Canadian who was indicted in the United States in May 1964 by a Texas grand jury for smuggling narcotics from Mexico into Texas. Rivard was arrested in June near Montreal, and the United States demanded his extradition.

Pierre Lamontagne, a Montreal lawyer representing the American authorities, found himself under pressure from various persons in the Canadian government to restrain his pleading before the court. He reported to the Royal Canadian Mounted Police (RCMP) that Raymond Denis, a cabinet aide, had offered him a \$20,000 bribe, and that Guy Rouleau, parliamentary secretary to the prime minister, had shown undue interest in the Rivard case.

Minister of Justice Guy Favreau decided that there was insufficient evidence to justify criminal proceedings against individuals named by Lamontagne, but he called the matter to Prime Minister Pearson's attention in September. In November, when questioned in the House about the affair, the prime minister forgot what Favreau had told him, and informed the House that he had not heard of it until much later. Reminded of his earlier knowledge, Pearson apologized for his error.

In November, before the details were made public, a Conservative member of Commons brought the matter before the House. As a result of the consequent pressure, the government agreed to appoint a one-man judicial commission to investigate alleged wrongdoing. Chief Justice Frédéric Dorian of the Quebec Superior Court was given the assignment, and the information he brought to light provided newspaper headlines for several months. In the midst of the disclosures, Rivard escaped from prison and was not recaptured for some time. Justice Dorian's report accepted Lamontagne's story, censured most individuals named by him, exonerated Guy Favreau of any wrongdoing other than misjudgment, and criticized the RCMP for questioning French-Canadian suspects in English.

Prime Minister Pearson acted decisively against all individuals who had been found guilty. He refused to accept Favreau's offer to resign, but transferred him to the minor Privy Council post. Rivard was duly extradited, found guilty in a Texas court, and imprisoned in the United States. But the uneasiness aroused by the affair was instrumental in keeping the government from winning its expected majority in the November elections.

CANADIAN-AMERICAN RELATIONS

In January, U.S. President Lyndon B. Johnson and Prime Minister Pearson signed an agreement to integrate the automotive industry on a continental basis. Details of the agreement were criticized in both countries, but the result appeared to be a large new Canadian investment in the manufacture of motor vehicles and parts. (See also AUTOMOBILES.)

In April, Prime Minister Pearson apparently annoyed President Johnson by suggesting in a speech at Temple University in Philadelphia, Pa., that a pause in American bombing of North Vietnam might encourage peaceful negotiations. The Pearson speech, however, was only a mild reflection of the stream of criticism about United States policies in Vietnam that poured from Canadian public speakers,

editors, leftist politicians, university "teach-ins," and student demonstrations.

Later in the year a commission of two distinguished diplomats—the American Livingston T. Merchant and the Canadian Arnold D.P. Heeney—reported to their respective governments that quiet negotiations rather than public disagreements should be the normal procedure in Canadian-American diplomacy. Their recommendation raised a storm of protest in Canadian newspapers, which accused them of attacking the Canadian right of freedom of speech.

The government's new law forbidding foreign ownership of Canadian newspapers was also attacked as infringing on the right of freedom of the press. Tax penalties were imposed on companies advertising Canadian products in foreign periodicals distributed in Canada; but *Time* and *Reader's Digest* magazines were exempted from this ruling because they print Canadian editions in Canada, an exemption that caused criticism.

There was also continued discussion of the danger of increasing American control of Canadian business. After the U.S. government hiked interest rates and placed restrictions on investments abroad, the Canadian government followed suit. These developments were cited as further examples of the manner in which the Canadian economy is controlled from south of the border.

When some prominent Americans suggested that Canada share her freshwater supplies with water-short areas of the United States, the Canadian public indignantly accused them of seeking to undermine the free development of Canadian resources.

Altogether, events in 1965 hardly foreshadowed warmer relations between the two countries.

University of Toronto

THE CANADIAN ECONOMY

In his review of the economy during 1965, Minister of Finance Mitchell Sharp noted that "in terms of the pace of national economic growth, Canada has maintained a foremost position among the countries of the world." His opinion was verified by the developments of 1965.

The gross national product rose 9% in 1965 over that of 1964. Total output was up by almost 6% in all major areas, and agricultural production reached record levels. Employment was up by 3.7%, and unemployment fell below 4%. The improvement in employment was accomplished in spite of a rising rate of immigration and an increase in population.

Diversification of the economy, from basic resources production to a more broadly based structure, received major impetus in 1965. The most notable increase was in motor vehicle production, which rose by 20%, and in the manufacture of automotive parts.

While production costs rose about 3% over those for 1964, and the consumer price index was up by 2.5%, their effects were mitigated by a 5% increase in per capita income. Outlays for business expansion matched the 15% increase of 1964. Construction outpaced the labor supply, forcing the government to restrict federal building projects. Investment spending neared inflationary proportions, bringing about government restrictions.

The gap between Canada's imports and exports widened during 1965, raising the export deficit to an annual rate of \$1 billion (more than twice that

CANADIAN-FRENCH CULTURAL AGREEMENT is affirmed by a handshake between French ambassador to Canada, François Leduc (l.), and the external affairs minister, Paul Martin.

of 1964). Increased domestic demand for export items, combined with decreased sales to some foreign markets, adversely affected the balance of trade. Exports were up only 4%, while imports rose by 12%.

Government experts felt, however, that an inflow of United States investment capital and the sale of Canadian securities abroad would reduce the trade deficit. A sharp rise in Far Eastern markets also was expected to improve the export situation. Other favorable prospects were a \$450 million purchase of Canadian wheat by the USSR and a \$403 million wheat contract with Communist China.

Finance. In the fiscal year ending March 31, 1965, Canada's budget deficit was reduced to \$83 million (from \$619.2 million in 1964). Revenues totaled about \$7.2 billion (up \$44 million from original estimates) and expenditures were slightly over \$7.2 billion (down \$1 million from the forecast). The 1965-66 budget, however, forecast a \$300 million deficit, with expenditures totaling an anticipated \$7.7 billion, and revenues at \$7.4 billion. One reason for the increased deficit was a 10% cut in personal income taxes, which would reduce revenues by \$175 million for the nine remaining months of 1965, and by \$265 million for the full year. A second reason was the inauguration of a national medicare plan, with the federal government paying 50% of costs (totaling \$64 million for the remainder of 1965 and expected to average \$500 million in combined federal-provincial costs in a full year).

Hope for a decrease in government spending was based on funds accruing from the National Pension Plan (inaugurated Jan. 1, 1965). Under the plan, both employers and employees contribute 1.8% of salaries over \$600 a year (up to a maximum of \$5,000). The plan was expected to create a government investment pool of \$5 billion in 10 years. These reserves would eliminate the need for heavy borrowing abroad, and in time would lower Canadian interest rates on borrowing to the level in effect in the United States.

Meanwhile, interest rates on borrowing increased. Finance companies raised rates to industrial borrowers to 5.5%, and bank discount rates to prime borrowers ranged from 4.75% to 6%. Despite discontent in financial circles with the 6% ceiling on

CANADA'S INDUSTRIAL AND AGRICULTURAL PRODUCTION INDEXES, 1953-65
(1949=100)

(TOP) ANNAN; (BOTTOM) UPI

the bank rate, the government maintained the limitation, at least for the present.

Manufacturing. Canada annually registers an increase in the volume of manufactures, which showed an index of 197.2 for the first nine months of 1965 (1949=100). However, the demand for products still outstrips supply because of a labor shortage.

The monthly value of manufacturing shipments for the first seven months of 1965 averaged \$2.8 billion, compared with an average of \$2.6 billion for the same period of 1964. All indications pointed to an even greater increase by the end of 1965. Key factors in the continuing industrial prosperity were the expanded production of motor vehicles and automotive parts; increasing domestic oil production; and a sharp rise in iron and steel output.

The construction industry in 1965 operated at full capacity as public and private construction vied for inadequate supplies of building materials and labor. The federal government eased the demand by spacing its projects to fit production lags. Private housing starts rose by 18% over 1964 totals.

Investment in plant and equipment showed a marked advance, with an estimated increase of 18.5% over 1964 outlays. The federal government provided a vital stimulus to industry with the creation of the Canada Development Corporation.

Agriculture. While the large sales of wheat to Communist countries helped to increase Canadian

exports, they were viewed as a mixed blessing by the Canadian farmer. The contract with Communist China called for sales at 12 cents per bushel less than the market price. The wheat farmer's gain in total income was dimmed by news of increased United States subsidies to American wheat farmers. These subsidies would, in effect, lower the cost of American wheat to the level of the special price set for the contract with China. The Canadian farmer receives no government subsidies; therefore, he had to consider his reduced price as permanent if he wished to remain competitive with American farmers.

Other agricultural products were exported in sizable quantities. Shipments of meat and animal products brought over \$150 million; oilseed and products, over \$100 million; dairy products, more than \$60 million; tobacco, about \$36 million; and fresh fruits, over \$20 million.

A monthly average of 621,000 persons were employed in agriculture during 1965. Cash farm income in 1965 was about \$865 million, holding level with the 1964 total (including grain, \$320 million; vegetables and field crops, \$60 million; cattle and calves, \$170 million). Milk production totaled 1.6 billion pounds (equal to 1964), and eggs, 37 million dozen. The sale of hogs was down 9% from 1964, to 5.4 million, and poultry sales were 75.7 million.

The government earmarked \$125 million over the next five years for projects in ten major areas across

Canada to improve the lot of farmers who live below subsistence levels.

Mining. Mineral production was valued at \$3.7 billion in 1965, showing an increase of 10.3% over the \$3.4 billion reported for 1964. Values were higher for copper, iron ore, lead, zinc, nickel, natural gas, and crude petroleum. Values for gold, uranium, asbestos, and coal were lower.

In 1965, metals, ores, and concentrates were up in value by 12.9% over 1964, to \$1.9 billion. Nickel showed the highest increase—\$435 million in 1965, compared with \$379 million in 1964. The value of nonmetallic minerals was up 9.5% from \$284 million in 1964 to \$311 million in 1965, although asbestos dropped slightly, from \$145 million to \$140 million. Mineral fuels topped \$1 billion (from \$999 million in 1964), with crude petroleum up to \$718 million.

Structural materials increased in value by \$20 million, to \$423 million in 1965. Cement was the highest gainer, with \$145 million (\$131 million in 1964).

New developments in the mineral industry included a major increase in potash production and the discovery of a vast iron lode in Baffin Island. The government announced plans to stockpile uranium, and interest increased in the mineral potential of the Yukon and the Northwest Territories.

Foreign Trade. Export shipments (including re-exports) in the first nine months of 1965 averaged \$712 million monthly. The United States was the principal market, taking over \$407 million monthly. Imports in the same period averaged \$700 million monthly, with the United States the major supplier.

The market for domestic exports, however, showed a varying picture during 1965. Exports increased to the United States, the Benelux countries, Norway, Australia, and South Africa, but decreased to Britain, Communist China, Japan, and West Germany.

Another heartening factor was the emergence of Japan as a major new market in 1965. There was also a phenomenal increase in exports of Canadian automotive products (up 200% over 1963).

Transportation. Roadbuilding received a major impetus during 1965. One area was the province of Quebec, where efforts are being made to improve highways for the 1967 Canadian world's fair. The second area is the Yukon and Northwest Territories, where a roadbuilding program is in progress to help exploit their mineral resources.

Airline service was improved by the introduction of nonstop service between western Canada and Britain. An all-cargo jet service began between Montreal and Vancouver. Also, a bilateral air treaty was signed with the United States.

Communications. A new long-range marine radio-telephone station was opened in Vancouver. Mail carrier service was extended to 62,000 more families. However, mail service throughout Canada was interrupted by a postal strike in July.

Both the French- and English-language radio and television networks were expanded during the year. Color television was scheduled to begin in 1967.

CANADIAN LITERATURE

With the 100th anniversary of Canada's confederation but two years away, Canadian writers in English produced more books about public affairs in 1965. Besides analyses of the political and social scenes, works of imaginative literature and scholarship interested readers from coast to coast.

Public Affairs and History. The national mosaic was dissected and analyzed as usual in such works as Peter Desbarats' *The State of Quebec*, Thomas Sloan's *Quebec: The Not-so-quiet Revolution*, and Richard Laskin's *Social Problems: A Canadian Profile*. In *Ten to One*, Marcel Faribault and Robert M. Fowler wager that the country can survive, but Vincent Massey warns in *Confederation on the March* that "too many of us have lost the concept of Canada." In *Lament for a Nation*, George Grant criticizes the "wealthy and the clever" for allowing the country to become part of what he calls the universal American empire. John Porter's well-documented analysis, *The Vertical Mosaic*, controversially, ruthlessly, and objectively studies social class and power in the country. In this sociological study he denies that Canada is a land of opportunity for all.

Several books about religion attracted considerable attention. Pierre Berton provoked nationwide religious controversy with *The Comfortable Pew*. Catholic laymen spoke their minds in *Brief to the Bishops*, edited by Paul T. Harris. Simma Holt's *Terror in the Name of God* again drew attention to the Doukhobors.

An election year, as 1965 was, automatically provides material. Heath Macquarrie wrote *The Conservative Party*; George Hogan presented party principles in *The Conservative in Canada*; and Robert M. Thompson, leader of the Social Credit party, published *Commonsense for Canadians*. Other cures for Canada's ailments appeared in *The Prospects for Change*, edited by Abraham Rotstein.

Among the less imposing works on Canada was Margaret McIntyre's *Place of Quiet Waters*, concerning Sechelt, in British Columbia. But for homely philosophy, descriptive geography, and sometimes questionable history, one should read Edward McCourt's *The Road Across Canada*, about motor-ing from St. John's to Victoria. Though all who know the road will disagree with parts of this book, nearly all will wish that they had written it.

The expected military works were forthcoming. James Eayrs' *In Defence of Canada* exonerates the regular officers of 1919–39 from responsibility for Canada's unpreparedness, and blames politicians and an indifferent public. Andrew Brewin's *Stand on Guard* pleads for a nuclear-age defense policy in the form of a world community. Other works consider specific wars: Donald Pearce's *Journal of a War* depicts the ghastly Europe of 1944–45; Gregory Clark, the old storyteller, spins *War Stories* of two wars; and Ernest G. Black's *I Want One Volunteer* humorously returns to 1916.

Poetry. In *Pauline Johnson*, a biography and a collection of poetry and prose, Marcus Van Steen attempts to rehabilitate the Canadian Indian poetess who died in 1913. Alfred Purdy's mistitled *The Cariboo Horses* contains one particularly good poem, "Homo Canadensis," a socio-psychological study of the species. More profound and controlled is Michael Parr's first volume, *The Green Fig Tree*, consisting of poems about love, nature, and religion. His imagery and sounds, as well as his unobtrusive, scholarly, and perfect use of classical allusions, all delight; but most delightful is his sure, self-disciplined use of old verse forms and his unabashed pride in using them.

Fiction. New fiction abounded in 1965. Arthur Hailey's *Hotel* weaves together six or seven plots, but his characters have no depth. The characters in David Walker's *Mallabec* have no depth either, although the novel absorbs a reader's interest up to the

unjustified denouement. In contrast, Charles Israel's *Shadows on a Wall*, about a Los Angeles couple who adopt a mentally disturbed Ghanaian girl, shows the deep shadowy relationships of love and race. The novel almost demands that the reader evaluate his own claims to toleration. In *A Gift of Echoes*, Robert Harlow probes the brutal and unnecessary tragedy in those small, rough lumber camps where human relationships are closely entangled.

Sex provides the theme and story of the year's most audacious novel, Stephen Vizinczey's *In Praise of Older Women*. This witty and joyful book has lusty overtones reminiscent of the works of Benvenuto Cellini and Henry Fielding. Set mostly in Hungary during and after World War II, but with Canada as a later locale, the hero emerges from a series of love affairs without a neurosis of any kind.

Juveniles. Canadian literature for children was especially appealing. With a sense of authenticity, Cliff Faulkner's *The White Calf* tells of a Piegan Indian boy who finds a buffalo calf, takes it home, and grows up that summer as the result of the experience. Donald Dodds' simple, fascinating, and sometimes horrifying *Wild Captives* follows from birth some Newfoundland animals as they fearfully meet or miss death from man or other predators. Two beavers befriended by Cree Indian children appear in *Rusty and Susie*, a lively tale by H. Clifford Dunfield. Paul St. Pierre's adaptation of one of his successful *Cariboo Country* television stories, *Boss of the Nankoo Drive*, is a thrilling account of a young boy's experiences as he moves a herd of cattle to the railhead.

Material with history as background also provided good reading. Margaret Bemister's *The Arrow Sash* steps back in time to the bride ships of Quebec. James Reaney cleverly returns to the printing press of William Lyon Mackenzie in *The Boy with an R in His Hand*. John Bassett involves two Welland boys in an exceptionally believable story, *The Canal Builders*. In *Substitute General*, John Reymayne's hero Peter Maclean stands in for Napoleon Bonaparte and uncovers a plot to kill him.

White-Indian relationships are ably contrasted in two excellent books. Louella Creighton's *Tecumseh* gracefully and sympathetically traces the life of the great warrior and the arrogant betrayal of the Indian by the whites. Christie Harris' *West with the White Chiefs* retells the trek of Milton and Cheadle through the Rocky Mountains to the Pacific. The focus is on young Louis, the Assiniboine Indian boy who learns the laws of life. He discovers that there are only two kinds of people, not white and Indian, but people "who delude themselves, and people who tell themselves the truth."

Biography. Two autobiographies recalled Canada's past. George Shepherd's *West of Yesterday* provides details of pioneer life on the prairies after 1908. Guy Lawrence's *Forty Years on the Yukon Telegraph* pictures a young English boy who comes to Canada too late to find gold but remains in the country.

Biography was exceptionally good. Joseph Schull's *Laurier*, a somewhat flashy and sometimes questionable account of the old prime minister, is still good reading. Exceptional also is Phyllis Grosskurth's *John Addington Symonds*, a skillfully written, scholarly account of the homosexually tormented writer and the Victorian England in which he lived. This biography won the Governor General's award for nonfiction.

Literary History. The crowning scholarly work of the year was *Literary History of Canada: Canadian*

Literature in English, prepared under the general editorship of Carl F. Klink. The labor of 33 scholars, this brilliant book chronologically follows literary trends and influences from 1510 to the present, and includes much on religion, politics, philosophy, science, and exploration.

GORDON R. ELLIOTT

Department of English, Simon Fraser University

FRENCH CANADIAN LITERATURE

Creative writing dominated the French Canadian literary scene in 1965. The year was mainly productive in good French Canadian fiction. Several good novels and interesting books of short stories appeared. No less than eight novels or books of short stories were by authors who had previously published books of verse. Poetry itself, however, exhibited few remarkable achievements.

Fiction. The poet Georges Cartier was awarded the Prix du Cercle du Livre de France for his first novel, *Le poisson péché*. The story concerns a French Canadian in Paris who hesitates whether to go back home or to stay in France, where he feels both at home and in exile.

Two previous winners of the same prize published good second novels: *L'eau est profonde*, by Diane Giguère, and *L'île joyeuse*, by Louise Maheux-Forcier. Both deal with disappointments of adult women in contrast with their happy memories of youth. Jacques Godbout's second novel, *Le couteau sur la table*, is a sketchy but clever analysis of what brought a young French Canadian man and an English Canadian girl together and of how their intimacy ends.

Other brilliant new novels are *L'incubation*, by Gérard Bossette; *La jument des Mongols*, by Jean Basile; and *La nuit*, by the satirist Jacques Ferron, who again supplies some good fun. Jean Hamelin does the same in the best volume of short stories of the year, *Nouvelles singulières*.

Poetry. Universal themes such as love and death, freedom, and winter continued to retain the attention of French Canadian poets. They nevertheless have been increasingly influenced by contemporary events, as was clearly evidenced in 1965 by the publication of such works as *Pour les âmes*, by Paul-Marie Lapointe; *Le soleil sous la mort*, by Fernand Ouellette; *L'afficheur hurle*, by Paul Chamberland; *Mémoire*, by Jacques Brault; and *L'honneur de vivre*, by Gilbert Choquette.

Nonfiction. The best book of the year might very well be the remarkable essays collected by Fernand Dumont in *Pour la conversion de la pensée chrétienne*. The sociologist and poet studies the basic religious problems facing Christians in the present years of revival and reform brought about by the Ecumenical Council. Jean Simard, on the other hand, discusses arts and letters and contemporary French Canadian society in his *Nouveau répertoire*. The autobiographical *Sous le soleil de la pitié*, by Jean-Paul Desbiens (Brother Anonymous), is a significant document on contemporary Quebec.

Other interesting books include the novelist Ringuelet's posthumous *Confidences*; Marcel Gagnon's new biography, *Arthur Buies*; Louis-Philippe Audet's *Histoire du Conseil de l'Instruction publique de la province de Québec*; Roger Duhamel's *Aux sources du romantisme*; and Paul Toupin's controversial and polished *L'écrivain et son théâtre*.

CANALS

In the space age, water transportation still plays an important role. In fact, the Saturn booster rockets for the Apollo moon program are so big they cannot be transported by railroad or highway, and barges must do the job. Produced at the Michoud plant near New Orleans, the rockets are shipped by barge to the nearby Mississippi Test Facility for static testing, and then go via the Gulf of Mexico to NASA's launch site at Cape Kennedy, Fla.

Cross-Florida Canal. Construction was in full swing in 1965 on the \$158 million, 185-mile barge canal across northern Florida. Talked about since the days of the Spanish colonists, the project will provide a 12-foot-deep, 150-foot-wide waterway from Jacksonville on the east coast to Yankeetown on the Gulf of Mexico. As opposed to the sea-level canal for oceangoing ships started by the Roosevelt administration in 1935, the canal now under way is for shallow-draft shipping. It has five locks to lift barge tows over the so-called summit of Florida, a low plateau in the central part of the state.

Panama Canal. Surveys and studies in 1965 delved into financing, construction, and operation of a new sea-level canal linking the Atlantic and Pacific oceans. Many observers felt that Panama may well be the site eventually chosen. Abrogating the original 1903 treaty, President Johnson and Panama's President Marco Robles in 1965 signed a new treaty giving Panama sovereignty over the existing Panama Canal Zone and permitting Panama to share management of the old canal with the United States. A sea-level canal across Panama would probably be the least expensive waterway to construct since it could follow the present route for the most part. In essence, this route would involve elimination of the present locks, the biggest bottleneck on the canal. Alternative routes also being surveyed are a different route through Panama, east of the existing canal; one through Colombia near the Panamanian border; and another along the Costa Rican-Nicaraguan border.

California Aqueduct. One of the most spectacular canal construction projects under way is part of California's State Water Project, a \$2.5-billion program to convey annually more than 2 million acre-feet of northern California water to the southern part of the state. In 1965, construction contracts worth \$300 million were under way for 200 miles of the 444-mile aqueduct, much of which is a concrete-lined canal. Huge canal-lining machines, resembling a cross between standard highway pavers and harvesting combines, move along the excavated sections of canal, casting the concrete floor and sloping sides of the canal in a continuous operation. (See also WATER SUPPLY.)

Chesapeake and Delaware Canal. Construction continued in 1965 on a major improvement program for the old waterway connecting the Delaware River and Chesapeake Bay north of Baltimore. The \$99 million project to deepen, widen, and straighten the canal also includes major highway and railroad bridge construction.

Welland Canal. As soon as the St. Lawrence Seaway closed for the winter of 1965-66, Canadian contractors moved in to perform the phases of the construction that would have interfered with shipping on a project to twin the last five locks on this key link of the seaway. The other Welland locks already have twin locks.

ENGINEERING NEWS-RECORD

CROSS-FLORIDA CANAL will provide a direct waterway from the Gulf of Mexico (foreground) to the Atlantic Ocean. Work was in full swing in 1965 on the \$158 million project.

Saimaa Canal. Finland is building a \$58 million waterway to link Lake Saimaa with the Bay of Finland. The 34-mile canal runs for 12 miles in the USSR under a 1963 treaty permitting a 50-year lease.

CANCER

The U.S. government, national organizations, and research centers increased their efforts in 1965 toward finding ways to control and cure cancer. International cooperation in the fight against cancer was established during the year. However, there was no major breakthrough in the treatment of cancer.

Institutional Programs. The National Institutes of Health allocated \$140 million for cancer research in 1965, and another \$15 million was being used to identify leukemia viruses and to develop methods for preventing and controlling human leukemia. The National Cancer Institute appointed task forces to hasten the control of lymphomas and breast cancer, and the American Cancer Society contributed \$13 million for cancer research.

The major recommendations of the President's Commission on Heart Disease, Cancer, and Stroke concerning the creation of regional clinical centers for training, treatment, and research were approved by Congress and President Johnson. The National Cancer Institute is at Bethesda, Md.

The International Agency for Research on Cancer was established in 1965 with the assistance of the World Health Organization. The current sponsors—France, the United States, Great Britain, West Germany, the Netherlands, and Italy—have each made an initial contribution of \$150,000.

Incidence of Cancer. The American Cancer Society estimated the number of new cases of cancer in the United States during 1965 at 550,000, and the number of deaths from cancer at 295,000. Although the

BROOKHAVEN NATIONAL LABORATORY

CANCER PATIENT receives radiation treatment for leukemia. The heart pumps blood through tubing to a container, where it is irradiated by gamma rays before returning to the body, avoiding direct radiation of the patient.

yearly incidence of most forms of cancer has been stable, new cases of cancer of the cervix of the uterus, stomach cancer, and cancer of the liver have decreased. Cases of lung cancer (the number of deaths in 1965 was estimated at 47,000), cancer of the pancreas, and leukemia have increased. The remarkable drop in the incidence of stomach cancer has been related to improved nutrition.

Smoking and Cancer. The relationship between the use of cigarettes and lung cancer is widely accepted, and the U.S. Public Health Service and private organizations are attempting to discourage cigarette smoking. The percentage of men who smoke has been reduced from 59% in 1962 to 52% in 1965, and a report issued in January 1965, estimated that 3,300,000 men and 200,000 women had stopped smoking in the past two years. Congress has directed that cigarette packages carry the label "Caution: cigarette smoking may be hazardous to your health." But the rise in the incidence of lung cancer continues. Statistics indicate that the yearly rate of new cases among American men is 40 per 100,000.

Viruses. Viruses produce leukemias and other types of cancers in laboratory animals, but attempts to find viruses associated with leukemia in human beings have been unsuccessful thus far. Although several preliminary reports have suggested such an association, their conclusions have been questioned by others. Some investigators have reported the presence of "virus-like" particles in the blood cells and serum of leukemia patients, but others believe that these particles are fragments of platelets or are a pleomorphic microorganism, mycoplasma (PPLO).

Antibodies. If a human cancer contains a specific antigen, it may be possible to assist the body to produce antibodies that can eliminate the residual cancer cells after the bulk of the cancer has been destroyed by surgery, radiotherapy, or chemotherapy. This method has been used for leukemia patients. Leukemic cells are removed from a patient and stored. After a remission is produced by chemotherapy, an extract of these cells is injected into the patient in the hope of producing antibody formation against the few persistent leukemic cells that almost inevitably restore the leukemic process. The benefits of the procedure are not known.

Therapy. There were no major advances in the treatment of cancer in 1965. Dr. E.P. Cronkite, at the Brookhaven National Laboratory, and Dr. E.D. Thomas, of the University of Washington, independently treated leukemia by irradiating the blood while it is circulated through tubes outside the body. This method destroys the abnormal cells, and it avoids direct irradiation of the patient.

Intensive combination-drug therapy is being used in an attempt to increase the survival rate in acute leukemia cases by destroying the maximum number of leukemic cells. Although serious damage to normal tissues will occur, the patient is sustained by blood and platelet transfusions during the period of injury to the normal bone marrow. Plastic envelopes large enough to enclose a bed keep a patient under almost sterile conditions in order to minimize exposure to infection.

CENTRAL AFRICAN REPUBLIC

The government of the Central African Republic was overthrown on Dec. 31, 1965. Col. Jean Bedel Bokassa, Army chief of staff, seized power and

—CENTRAL AFRICAN REPUBLIC · Information Highlights—

Area: 238,224 square miles.
Population: 1,320,000 (July 1, 1964, est.).
Chief City (1964 census): Bangui, the capital, 111,266.
Government: Head of State—Col. Jean Bedel Bokassa (seized power Dec. 31, 1965). *Parliament*—National Assembly, 50 members, all belonging to the Movement for the Social Emancipation of Black Africa (MESAN).
Religious Faiths: Tribal religions, 60% of population; Protestants, 15%; Roman Catholics, 13%; others, 12%.
Education: Total school enrollment (1962)—90,615 (primary, 87,528; secondary, 2,402; teacher-training, 342; technical, 343).
Finance (1964): Revenues, \$25,500,000; expenditures, \$26,700,000; monetary unit, CFA franc (246.85 francs equal U.S.\$1).
Gross National Product (1962): \$51,000,000.
Economic Index: Cost of living (1964), 125.60 (1960=100).
Manufacturing: Beer (1963), 66,000 hectoliters; lumber (1962), 41,000 cubic meters; meat (1961), 11,000 metric tons.
Crops (metric tons): Peanuts (1963–64), 75,000 (ranks 20th among world producers); cassava (1961–62), 2,200,000; sweet potatoes and yams (1961–62), 90,000; cottonseed (1964–65), 22,000; cotton lint (1964–65), 11,000; coffee (1964–65), 8,700.
Minerals (1964): Gem diamonds, 221,000 carats (ranks 10th among world producers); gold, 75 troy ounces.
Foreign Trade (1964): Exports, \$28,900,000 (chief exports: diamonds, \$12,400,000; coffee, \$8,000,000; cotton, \$5,600,000); imports, \$29,800,000 (chief imports, 1963: motor vehicles, \$3,100,000; woven cotton fabrics, \$2,500,000; non-electrical machinery, \$1,900,000). Chief trading partners (1963): France (took 47% of exports, supplied 60% of imports); United States (took 18% of exports, supplied 5% of imports); Israel (took 24% of exports).
Transportation: Roads (1964), 11,325 miles (54 paved); motor vehicles (1964), 6,150 (automobiles, 1,850); Principal airport, Bangui.
Communications: Telephones (1964): 2,300; radios (1963), 20,000; newspapers (1962), 1 (daily circulation, 400).

arrested and imprisoned President David Dacko and several cabinet ministers. Colonel Bokassa said that the coup was necessary to end social injustices.

Relations With Communist China. After the coup, Colonel Bokassa announced the expulsion of all Communist Chinese nationals from the Central African Republic. Earlier in the year, on January 14, Communist China established a diplomatic mission in the Central African Republic. At that time the two countries signed an accord which provided for a long-term Chinese loan of more than \$4,000,000 for aid and for the development of light industry.

Diamond Mining. During 1965, diamonds became the most important cash product of the Central African Republic. Nearly 500,000 carats were produced, accounting for about \$20,000,000, or about 75% of the total value of the country's exports.

President Dacko's Trip. For 45 days during May and June, Dacko visited France, West Germany, Luxembourg, Switzerland, Italy, and Greece. Upon his return, he indicated that prospects for aid and trade looked promising.

Economic Development. In July, the Central African Republic received a loan of \$1,000,000 from West Germany's Reconstruction Credit Office to help finance small and medium-sized enterprises in agriculture, commerce, and handicrafts.

In August, the cornerstone of a \$10,000,000 textile complex, Industrie cotonnière centrafricaine, was laid at Bangui. The complex, which is owned jointly by a French textile group and the Central African Republic, will employ up to 1,000 workers and produce up to 8,000,000 meters of cloth annually.

CENTRAL AMERICA. See LATIN AMERICA and the articles on Central American countries.

CEYLON

The United National Party (UNP), under the leadership of Dudley Senanayake, won 66 of the 151 elected seats in the Ceylonese parliament in elections held on March 22, 1965. As the new prime minister, Senanayake also had the support of the Tamil Federalists and other smaller parties, thereby obtaining control of 90 seats. Mrs. Sirimavo Bandaranaike, the former prime minister whose Sri Lanka Freedom party (SLFP) won 41 seats, was reelected, as were many of her government's leaders. Although the UNP clearly gained control of the government, the party faced a strong opposition in Parliament.

New Government. The new government introduced a significant reversal of the trend toward leftist

policies that had occurred under the prime minister-ship of Mrs. Bandaranaike. While pledging a continuation of political nonalignment and friendship to all, the Senanayake government moved quickly to reassure Western powers. Political concessions that had been granted to Communist countries by the former government have been curtailed, and policies were established in both the political and economic spheres to improve Ceylon's relations with Western nations.

United States Resumes Economic Aid. In July the United States agreed to resume its economic aid program to Ceylon in response to the new government's assurance of compensation for properties of three Western oil companies that had been seized by the former government in 1962. Prior to the curtailment of aid, Ceylon had received nearly \$90 million in assistance under the program. The resumption of U.S. aid is expected to play an important part in the country's economic recovery.

Economy. In 1964, Ceylon approached the brink of economic disaster. The quick action of the Senanayake government to reinstitute U.S. aid was followed by a statement of fiscal policy designed to stimulate foreign investment in Ceylon.

On August 9, Finance Minister Ukku Banda Wanninayake presented the new government's first budget. He announced the immediate easing of the former government's moratorium on the remittance of dividends, interest, and profits to foreign investors, hoping to attract the investment of foreign capital by assuring the repatriation of profits. The terms for such investment are to be explicitly outlined. Wanninayake also announced the abolition of import duties on certain vegetables and kerosene,

CEYLON · Information Highlights

Area: 25,332 square miles.

Population: 10,965,000 (June 30, 1964 est.).

Chief Cities (1963 census): Colombo, the capital, 510,947; Jaffna, 94,248; Moratuwa, 77,632; Kandy, 67,768.

Government: Governor General—William Gopallawa; Prime Minister—Dudley Senanayake, took office March 25, 1965. **Parliament**—House of Representatives, 151 representatives; party seating (1965): United National, 66; Sri Lanka Freedom, 41; Tamil Federal, 14; other parties, 24; independents representing special interests, 6. **Senate**, 30 senators.

Religious Faiths: Buddhists, 64% of population; Hindus, 20%; Muslims, 7%; Roman Catholics, 7%.

Education: Literacy rate (1953)—68% of population aged 15 and over. **School enrollment** (1962; excluding higher schools)—2,351,433 (primary, 1,648,858; secondary, 702,575); higher (1961), 11,296.

Gross National Product (1964): \$1,518,000,000.

National Income (1964): \$1,366,000,000; average annual income per person, \$125.

Economic Indexes: Industrial production (1963), 139 (1958=100); agricultural production (1964), 129 (1956-57=100); cost of living (1964), 107 (1958=100).

Manufacturing (metric tons, 1963): Cement (1964), 75,000; meat, 17,000; sugar, 5,000; cotton yarn, 1,500; beer, 50,500 hectoliters.

Crops (metric tons, 1963-64 crop year): Rice, 1,026,000 (ranks 17th among world producers); tea (1964), 218,500 (world rank, 2nd); rubber (1964), 111,600 (world rank, 4th); cassava, 312,000; sweet potatoes and yams, 52,000.

Minerals (metric tons, 1963): Salt (1964), 58,000; ilmenite, 19,088; graphite (1964), 10,838 (exported); kaolin, 1,016; monazite (1961), 217.

Foreign Trade: Exports (1964), \$394,000,000 (chief exports: tea, \$240,000,000; rubber, \$61,000,000; coconut products, \$57,000,000); imports (1963), \$415,000,000 (chief imports: rice, \$40,000,000; refined sugar, \$15,000,000; wheat meal and flour, \$13,000,000). **Chief trading partners** (1963): Britain (took 31% of exports, supplied 20% of imports); Communist China (took 6% of exports, supplied 9% of imports); India (took 3% of exports, supplied 10% of imports).

Transportation: National roads (1964), 12,688 miles (8,590 paved); motor vehicles (1964), 128,315 (automobiles, 82,812); railways (1963), 898 miles; national airline, Air Ceylon Ltd.; principal airport, Colombo.

Communications: Telephones (1964), 41,000; radios (1962), 397,000; newspapers (1960), 8 (daily circulation, 356,000).

CAMERA PRESS-PIX

DUDLEY SHELTON SENANAYAKE, sworn in as prime minister of Ceylon on March 25, 1965, addresses the crowd after the success of his supporters had been assured in the March elections. He immediately set to work to heal the breach that had developed between Ceylon and the West during the administration of his predecessor, Mrs. Sirimavo Bandaranaike, promising a "truly unaligned" administration and a "national, not a party government."

Senanayake was born in Colombo, Ceylon, on June 19, 1911. He was the son of Don Stephen Senanayake, the first prime minister of Ceylon (1947-52) after the country achieved independence. He graduated from Corpus Christi College at Cambridge University, studied law at Middle Temple, London, and was called to the bar in 1934. He served in the state council of Ceylon (1936-37) and was minister of agriculture and lands (1947-52). Succeeding his father as prime minister in 1952, he held the post until 1953, and again briefly in 1960.

and ended tariffs on small farm implements and sporting goods.

Sinhalese Nationalism. Although the government promised to encourage the use of the Sinhalese language, it is expected to retreat markedly from the disruptive pro-Sinhalese policy of the Bandaranaike government. Senanayake has pledged special concessions to the Ceylon Tamil minority, and three of his 15-member cabinet are Tamil Federalists.

Cyclone Disaster. In 1965, Ceylon still felt the effects of the disastrous cyclone of Dec. 22, 1964, that caused vast damage to crops, food storehouses, homes, and fishing fleets. The death toll was estimated at 650 persons, most of whom were fishermen lost at sea.

CHAD

Chad's internal politics were relatively quiet during 1965, but its relations with neighboring Sudan were disturbed.

Foreign Affairs. In February, Chad became a member of the Organisation Commune Africaine et Malgache (OCAM: Joint Organization of African and Malagasy States), a new international group designed to strengthen political and economic cooperation among the French-speaking African states.

In June, Chad threatened to break relations with Sudan, with which it shares 500 miles of frontier.

The long-simmering issue between the two countries concerned Sudan's granting asylum to Chadian opposition elements operating in Khartoum, the capital of Sudan, as the "Government of the Islamic Republic of Chad." This group, according to President François Tombalbaye of Chad, aims to deliver northern Chad to "foreign governments" that seek its oil and other minerals, to replace the present government with an all-Muslim regime, and to convert the country's 153,000 Christians to Islam. The president charged that the Sudanese government has been providing arms, money, and advice to the exiles.

The crisis was settled after a Sudanese goodwill mission visited Fort-Lamy, the capital of Chad. On July 1 the negotiators announced an agreement whereby Sudan promised to expel Chadian subversives and assist in solving common frontier problems.

Economic Progress. Modest advances were made in Chad's attempt to attract foreign aid and capital investment. Aid and cooperation agreements concluded in 1965 between France and Chad provided for two French government loans. One, for \$2,653,200, was for agricultural development; the other, for \$1,000,000, was to improve education.

In January, Chad signed an agreement with a French-German private consortium to establish a textile complex at Fort Archambault. The West German government granted Chad a \$2,000,000 development loan to help finance the new industry.

CHAD · Information Highlights

ASIA

S. AMERICA

Area: 495,752 square miles.
Population: 3,300,000 (July 1, 1964, est.).
Chief City (1963 est.): Fort-Lamy, the capital, 91,700 (urban).
Government: President—François Tombalbaye (took office August 12, 1960). Parliament—National Assembly, 75 members (all belonging to the Parti Progressiste Tchadien).
Religious Faiths: Muslims, 52% of population; tribal religions, 43%; Roman Catholics, 3%; others, 2%.
Education: Total school enrollment (1962)—115,956 (primary, 112,863; secondary, 2,685; teacher-training, 193; technical, 215).
Finance (1965 est.): Revenues, \$33,900,000; expenditures, \$33,900,000; monetary unit, CFA franc (246.85 francs equal U.S.\$1).
Gross National Product (1962): \$120,000,000.
Economic Index: Cost of living (1964), 143 (1958=100).
Crops (metric tons): Cottonseed (1964-65), 67,000; cotton lint (1964-65), 37,000; dates (1962-63), 25,000; peanuts (1962-63), 140,000.
Mineral (metric tons, 1964): Natron, 7,300.
Foreign Trade (1964): Exports, \$26,500,000 (chief export: cotton, \$20,900,000); imports, \$34,600,000 (chief imports, 1963: petroleum products, \$4,400,000; motor vehicles, \$2,600,000; woven cotton fabrics, \$1,900,000). Chief trading partners (1963): France (took 55% of exports, supplied 53% of imports); Nigeria (took 14% of exports, supplied 3% of imports); Netherlands Antilles (supplied 10% of imports).
Transportation: Roads (1964), 8,072 miles (16 paved); motor vehicles (1964), 5,705 (automobiles, 2,370); principal airport, Fort-Lamy.
Communications: Telephones (1964): 2,472; radios (1963), 18,500; newspapers (1961), 1 (daily circulation, 700).

CHEMISTRY

The production of elements and compounds by the U.S. chemical industry in 1965 continued to show an upward trend similar to that of other large industries. In 1964, production of chemicals increased by 6%, and sales totaled a record \$36 billion.

Estimated production of heavy metals in 1965 was (in million tons): pig iron, 95.0; aluminum, 2.7; copper, 1.3; zinc, 0.6; and lead, 0.3. Production of the leading inorganic chemicals in 1965 was (in million tons): sulfuric acid, 24.2; lime, 15.5; ammonia, 8.4; sodium hydroxide, 6.8; sulfur, 6.4; and sodium carbonate, 4.8. Of the latter, ammonia production grew the most rapidly, and the output of ammonia plants under construction in 1965 will probably double production within three years.

In the organic field in 1965, petroleum was the source of 19 million tons of products of all types. The output of benzene, made largely from petroleum hydrocarbons, amounted to 3.1 million tons, and toluene totaled about 2.7 million tons. The increased amounts of benzene were the result of dealkylation of toluene. The output of resins and plastics amounted to over 10 million tons, or about twice that of all metals except iron.

The production of synthetic textiles of all types totaled nearly 1.5 million tons in 1965. Synthetic rubber production, totaling four times the amount of imported natural rubber, was a little less than 2 million tons.

Metals. The completion of basic oxygen furnaces begun in the autumn of 1964 enabled the steel industry to make about 36.5 million tons of steel by this process in 1965. The earliest-built basic oxygen furnaces have a capacity of 60 tons of steel per heat. Two recently installed furnaces have capacities of 250 tons each, and another may have a capacity of 300 tons. The steel industry is also capable of making a higher grade product by vacuum degassing and continuous casting.

To meet the competition of tin plate and plastics in the packaging field, the steel industry is making light-gauge, flat-rolled steel coated with aluminum. To manufacture this product, the coating metal is vaporized in a crucible by an electron beam, and moving strips of steel pass through the metal vapor in a vacuum to avoid the formation of aluminum oxide. Aluminum-coated steel has high lacquer adhesion, formability, and corrosion resistance.

Small-volume plants are making use of a new copper production process that not only enables

them to compete with larger plants using conventional methods, but also eliminates air and water pollution. In this process, copper sulfate solutions, obtained by acid leaching of copper ores, are exposed to detinned iron cans, precipitating a powder with from 84% to 88% copper. The powder is washed from the iron, dried, and leached at 140°F with a solution of sulfuric acid through which air is blown. Ferric hydroxide and other impurities are filtered off, and the filtrate is preheated and reduced with hydrogen in an autoclave at 300°F under a pressure of 4,000 psi (pounds per square inch). The product, of electrolytic grade, is formed either by powder metallurgical methods or by melting.

Investigations of the properties of thin-film tantalum have revealed a new phase, called beta tantalum, that has radically different properties from common tantalum. Beta tantalum has higher resistivity and a lower temperature coefficient of resistance than ordinary tantalum, and it becomes a superconductor at a much lower temperature. Beta tantalum may be used, like the ordinary form, in the manufacture of capacitors for electronic, thin-film circuits because it readily forms oxides and can be anodized by usual techniques. Its high resistivity and low temperature coefficient will make it useful as a thin-film resistor. Although beta tantalum was discovered in connection with evaporation and chemical-vapor deposition processes, most of the material examined is now produced by cathode sputtering in argon at low pressure and in the presence of other gases in very small amounts. Further studies are being made to determine whether the new material is an allotropic modification of ordinary tantalum or an impurity-stabilized phase. Research will determine whether it can be produced in bulk form. (See also METALLURGY.)

Water Purification. The growing seriousness of the water supply problem has led to proposals to spend astronomical sums for diverting water from abundant rainfall areas to areas suffering from prolonged drought. However, until such schemes can become realities, there are two other possible methods of improving the situation. First, better use can be made of existing water supplies by treating industrial and municipal wastes, by using more completely biodegradable detergents, and by purifying river water more efficiently. Second, use can be made of brackish water unfit for domestic or industrial purposes, and salt and other minerals can be removed from seawater.

In 1965 the federal government increased its

SEA WATER will be converted into fresh water at the nuclear electric power and desalination plant to be built at Riverhead, N.Y. Incoming sea water is piped to main heating unit. The water receives heat from nuclear reactor. The heated sea water then enters an enclosed area where it is vaporized under reduced pressure. The vapor condenses on contact with the sea water intake pipe, yielding a supply of fresh water. Plant will make a million gallons of fresh water per day.

financing of saline water projects. Many methods of desalinization have been investigated, but only those involving the evaporation of heavily mineralized water and the condensation of the resulting vapor are seriously considered as a final solution. Of the four demonstration plants built by the Office of Saline Water of the Department of Interior, three, with a daily capacity of 1 million gallons each, are of the distillation type. Of these, one uses a falling film, 12-effect technique; another uses flash distillation in 36 stages; and the third employs forced-circulation vapor compression. The flash distillation plant has been moved to the U.S. Naval Base at Guantanamo, Cuba. The fourth demonstration plant, with a daily capacity of only 250,000 gallons, is based on a four-stage, electro dialysis process.

In Pennsylvania, a \$10 million plant with a daily capacity of 5 million gallons is planned for reclaiming acid mine water at a projected cost of 30 cents per 1,000 gallons. It is estimated that tens of billions of gallons of polluted water are now impounded in mine pools. Treated water from this source may then be drained into rivers.

A study is being made of the feasibility of combining a nuclear power station with a water-desalting station. This plant would consist of a thermoelectric power station that derives energy from a nuclear reactor, with exhaust steam fed to a water-desalting unit. This low-temperature steam, normally wasted, would enable the desalting facility to operate without a boiler. The complete combined plant might have a relatively small production volume, but it would be economically feasible, in contrast with the multimillion dollar evaporation plants now in use. There are many places in the United States where the smaller plants would be useful.

A large pilot plant has been tested for an enormous multiple-effect evaporator plant in California. The final equipment, of 16 superimposed stages, is to be 230 feet high. In this scheme deaerated seawater is fed through tubes to the top of the tower, where a part of the water will be vaporized. As the remaining brine passes down, lower pressures permit more vapor to flash off and condense on the tubes bringing up the brine feed. At the bottom stage, concentrated brine is drawn off at one point and the final desalted product at another. Inert gases also are removed under reduced pressure. A coolant passes through the lower part of each stage. Three such evaporators are planned for a plant that would produce 150 million gallons daily.

A problem common to all seawater desalting plants is that of scales forming on heat transfer surfaces. This problem is being met by controlling hydrogen-ion concentrations, by using calcium sulfate anhydrite slurry, and by selectively precipitating scale on inert particles in a fluidized bed.

Brackish water containing up to 3,000 ppm (parts per million) of total dissolved solids is treated successfully by a combination of weakly basic ion-exchange resins and acidic ion-exchange resins. Carbon dioxide is retained in the process, and regenerators are ammonia and sulfuric acid. (See also WATER SUPPLY.)

Inorganic Chemicals. Hydrogen is separated from hydrogen-carrying gases by diffusing it through a hot palladium wall at pressures of 200 to 500 psi. In the mechanism of diffusion, the molecules of hydrogen dissociate in the metal on the high-pressure side into atoms which dissolve in the metal and then recombine as they leave the low-pressure side. The diffusion process supplies very pure hydrogen. The

total capacity of plants depending on diffusion through palladium that are now in operation or under construction is about 34 million cubic feet per day. The process is also well adapted to laboratory-size units. However, the method is not expected to supplant either of the major processes for producing hydrogen—cryogenic (low-temperature) separation and differential adsorption. The projected plants will have more than 60% of the total capacity of planned ammonia plants of comparable size in the free world.

Since synthetic ammonia is the source of most nitrogen fertilizers, a new type of ammonia plant is expected to cause radical changes in the nitrogen fertilizer industry. The first of a series of such plants has a daily capacity of 600 tons of ammonia. Larger plants are in various stages of development.

The central role in the new type of plant is played by very large centrifugal compressors. Natural gas is the source of hydrogen, which is subjected to a high-pressure, catalytic steam-reforming process. Ammonia is synthesized at relatively low pressure. The plant is completely controlled by computers.

The so-called rare earths have varied, though limited, uses in chemical industries. Some of the more important uses are as ingredients in special types of glass, and as mixtures in glass polishes, arc carbons, and catalysts, and in alloys known as misch metal. Recently, an europium-activated yttrium vanadate proved to be a more efficient phosphor for color television sets than silver-activated zinc-cadmium sulfide. Instead of using dull green and blue phosphors to stay in balance with a dull red, the new phosphor, activated by europium, gives a sharper and brighter red. Only one europium atom is required for 19 yttrium atoms. However, increased sale of color television sets offers a profitable use for europium.

Synthetic potassium nitrate is being produced at a much lower cost than that derived as a by-product material from the Chilean nitrate fields. The synthetic process includes reactions involved in nitrogen, oxygen, and chlorine chemistry that must be carefully balanced and adjusted. Some intermediate products are so corrosive that parts of the equipment must be made of tantalum or lined with glass. The key to the new process is a dilute solution of nitric acid containing dissolved potassium nitrate that may be freed of water up to a concentration of 80% acid instead of the usual azeotrope of about 65%. The first step is the initial reaction between potassium chloride and dilute nitric acid. The mixture is fed into a column reactor. Dry chlorine and nitrogen dioxide are recovered from the top of the equipment, while the solution at the bottom is distilled and concentrated to 80% nitric acid content. Potassium nitrate is crystallized from the solution, dried, and marketed.

Organic Chemicals. Dimethyl sulfoxide (DMSO) is being extensively investigated as a medically active drug and as a carrier for other medical agents, but general acceptance in the pharmaceutical field is still in the future. Unfavorable newspaper publicity has prevented medical use of this compound until it has been tested more extensively. DMSO shows great promise as a carrier for pesticides, but its concentration must be limited to 1–2%. Solutions of 10% concentration have caused some burning of leaves. In the chemical industry, DMSO has proved to be a valuable solvent and reaction medium. It functions as a solvent for dyestuffs, and for such polymers as polyurethanes in coating fabrics. Acrylonitrile is polymerized in this solvent and is spun from it with superior strength. A French process em-

polysulfone to extract aromatics from petroleum refinery streams. It is recovered by a countercurrent stream of paraffins that strips the aromatics from the solvent.

The common antiknock additives for gasoline, tetraethyl lead and tetramethyl lead, are being made by an electrolytic process that appears to have the advantages of higher yields and of avoiding recovery of large quantities of byproduct lead. Instead of reacting the alkyl halides, ethyl and methyl chlorides, with an alloy of sodium and lead, Grignard reagents, which may be represented by the general formula RMgCl , are made by reacting the chlorides with magnesium. This material is soluble in a mixture of ethers that conducts the electric current. The metallic cell walls act as cathodes, and lead pellets constitute the anodes, with the two electrodes being separated by a diaphragm. The liberated magnesium is allowed to react with additional alkyl halide instead of bridging the gap between electrodes, as would occur in a conventional cell with plate or rod electrodes. To obtain a mixture of the two antiknock compounds, a Grignard reagent is made with one, and the other alkyl halide is added to the cell. The magnesium chloride remaining is used in magnesium cells.

The great extent to which the American public is dieting is vividly indicated by the increase in the production of cyclamate sweeteners. A new plant producing 4 million pounds annually increased the total output of cyclamate sweeteners to about 25 million pounds in 1965. This is equivalent to the sweetening power of 900 million pounds of sugar.

The problem of piece-dyeing polypropylene fabrics has been solved to a limited extent by using organonickel compound dyes. The molecules of such dyes must contain phenol, alcohol, and amino groups that form stable complexes with nickel. There are about 70 dyes which may be used in connection with polypropylene fibers.

Synthetic Resins and Plastics. The first plastic made by polymerization employing an oxidative coupling reaction by using gaseous oxygen is known as polypropylene oxide. The starting substance is 2,2-dimethyl phenol, made by methylating phenol, because xylene extracted from coal tar is limited in amount. Oxygen, solvents, and a copper-amine catalyst are used in the polymerization process. The product is a high-strength thermoplastic which retains its toughness at both low and high temperatures. It is competitive with metals, thermosetting plastics, and engineering-quality thermoplastics.

New polysulfone plastics are in commercial use, and a plant producing 10 million pounds per year was constructed in 1965. Heat deflection temperature of the plastic is 345°F , and the plastic may be used for long periods in the temperature range between -150°F and 300°F . In thicknesses greater than 0.075 inch, this material does not support combustion and is rated as self-extinguishing. Its dimensional stability under tension is evidenced by low creep values both at room temperatures and at the boiling point of water. Electrical properties are maintained up to the limits of use, even with high humidity and after immersion in water. Immediate uses for the material are extruded pipe and sheets that are both tough and corrosion resistant.

To produce this polysulfone plastic, diphenols such as bisphenol-A are dissolved in a mixture of benzene and dimethyl sulfoxide and are reacted with potassium hydroxide. Water is removed along with benzene, leaving the potassium salt in solution.

More solvent is added as a reactant along with 4,4-dichlorophenyl sulfone, and the mixture is heated for several hours. Polymerization takes place with formation of the polysulfone. The unit of the polymer is made up of four benzene rings linked by three atoms—carbon, oxygen, and sulfur. On the linking carbon atom are two methyl (CH_3) groups, and on the sulfur atom there are two oxygen atoms.

The advantage of the smooth and slippery surface of the synthetic, Teflon, far outweighs its relatively low heat conductivity in the construction of heat-exchange equipment. Teflon is replacing the common metals, which are more subject to fouling and corrosion. Instead of metal tubes of 4- to 5-inch diameters, manufacturers are using a much larger number of thin-walled Teflon tubes, whose diameters range from 0.1 to 0.25 inch. The plastic tubes require about one fourth of the space occupied by metal heat exchangers, and have equivalent heat-transfer capacity. They readily withstand pressures of 225 psi gauge at 70°F and 50 psi gauge at 300°F . Such materials as sulfuric and nitric acids, hydrocarbons, flue gases, and other corrosive materials that usually require conductors made of titanium, stainless steels, and other high-priced materials are now conducted through Teflon heat-exchangers.

Petroleum and Natural Gas. Petroleum refinery units, known as "cat crackers," that use fluidized beds of catalyst have set remarkable records of continuous operation. At a refinery in Louisiana, one of these colossal units operated for 1,399 consecutive days, and another operated for 1,467 days without a single interruption. The latter unit processed 116.3 million barrels of petroleum, supplying petrochemicals, heating oils, and gasoline. Another 256-foot-high cracker in Texas was completed during World War II and is the second of the type in the world. It processed a record 340 million barrels of oil.

Instead of separating helium from natural gas at extremely low or cryogenic temperatures, this element may be differentially absorbed by an infinitely large number of tiny hollow glass spheres, 0.002 inch in diameter, such as those used to protect liquids in large open storage tanks. Gas containing helium is brought into contact with the spheres at a temperature of 250°F and at a pressure of 2,000 psi. The helium diffuses through the very thin glass walls until the pressure inside and outside is equalized. The pressure is then relieved, the gases are removed, the spheres are reheated, and helium is diffused and collected.

Roads covered with petroleum, asphalt, and coal tar are being surfaced additionally with a thin coat containing emulsions of synthetic rubber polymers. The additive employed with petroleum asphalt is a butadiene-styrene copolymer, while the coal tar pitch is surfaced with an emulsion of butadiene-acrylonitrile derivatives. Several thousand miles of these rubberized roads were in use in 1965, as well as many similarly resurfaced airfields, city streets, and parking lots. Natural rubber may be used, but synthetic elastomers are preferred because they can be tailored as required to improve the properties of asphalt and pitch.

PROTESTING SEGREGATION in Chicago's public schools, civil rights demonstrators stage a march along Balboa Drive to the City Hall, June 10, 1965.

CHICAGO

In Chicago, the second most populous city in the United States (1965 est. city pop., 3,520,000; 1960 metropolitan area pop., 6,220,913), a controversy over de facto school segregation led to a congressional investigation and a temporary withholding of \$30 million in federal aid to the city's schools.

School Controversy. Demands for the immediate resignation of Superintendent of Schools Benjamin C. Willis and protests over de facto segregation brought continuing demonstrations by the Co-ordinating Council of Community Organizations during the summer. Martin Luther King visited Chicago on July 24-27 and led a march of 10,000 persons to City Hall.

In July, Superintendent Willis, local civil rights leaders, and other individuals testified in Washington before the U.S. House Committee on Education and Labor about Chicago's school integration. A major crisis occurred when Willis was notified on September 30 by U.S. Commissioner of Education Francis Keppel that the possible noncompliance of Chicago schools with the 1964 Civil Rights Act required that \$30 million in aid to Chicago schools be temporarily withheld—the first such action taken by the federal government in a Northern city. After much public outcry, a private meeting between Chicago's school board president, Frank M. Whiston, and the U.S. undersecretary of health, education, and welfare, Wilbur J. Cohen, resulted in the release of the federal funds.

Racial Violence. Racial violence broke out on the West Side in August. On Thursday night, August 12, an undermanned hook-and-ladder truck sped from a fire station, jumped a curb, and caused the death of a 23-year-old Negro woman, Dessie Mae Williams. Angry Negroes quickly gathered outside the predominantly white firehouse and the violence began. The riot grew, continued into the early morning, and resumed the next evening. By the time calm was restored, 170 persons had been arrested and 85 injured.

Government. Democratic candidates were successful in their bid to fill City Council vacancies in the "nonpartisan" aldermanic elections of May 18. The party lineup of the new 50-member council was: 41

Democrats, 6 Republicans, 2 independents, and 1 remaining vacancy.

For the first time, the Illinois General Assembly passed legislation granting a state subsidy to the Chicago Transit Authority. Mayor Richard J. Daley's tax proposals, however, were defeated by the Republican-dominated state Senate.

In August the Committee for Urban Progress, a citizens group, presented its proposals for the creation of a metropolitan form of government for the Chicago area. The two-year study indicated that the merger of the Chicago and Cook County governments would take ten years to accomplish.

Chicago Circle Campus. The \$50 million Chicago Circle campus of the University of Illinois opened its doors in February, and by September it had an enrollment of 8,200 students. Enrollments are expected to reach 14,000 by 1967 and 20,000 by 1969, and the second phase of construction plans has begun.

New Archbishop. Chicago mourned the death on April 9 of Albert Cardinal Meyer, head of the Chicago diocese of the Roman Catholic Church. In the late summer his successor, Archbishop John Patrick Cody, was warmly welcomed to Chicago from his former post as archbishop of New Orleans.

HUAC Hearings. On May 25-27 the U.S. House Un-American Activities Committee held hearings in Chicago on organizational changes in the Communist party. Efforts on the part of two subpoenaed witnesses to obtain a court injunction against the hearings failed. During the proceedings, crowds of over 200 persons protested the committee's activities, and 71 demonstrators were arrested.

Economy. The consumer price index for the Chicago area was 107.7 in July 1965 (1957-59 = 100). During the first 8 months of 1965, investment in industrial plants was valued at \$492,075,000, and steel production amounted to 17,033,000 tons. In the same period 11,918 building permits were issued. Unemployment in Chicago averaged 101,200 during the first 8 months of 1965, and the number of persons employed averaged 3,088,900.

Affairs, University of Chicago

CHILD WELFARE AGENCIES ease the plight of orphans throughout the world. Here, South Korean children are about to receive gift parcels from abroad.

CHILD WELFARE

This article reviews social and economic developments affecting children and youth, under two headings: (1) U.S. Programs; and (2) International Programs. (For information about juvenile delinquency, see *CRIME*; for medical information on children's diseases, see *PEDIATRICS*.)

U.S. PROGRAMS

Child welfare programs in the United States in 1965 were planned to combat four basic evils: denial of civil rights, poverty, ignorance, and poor health. The Children's Bureau of the Department of Health, Education, and Welfare is the chief federal agency dealing with child welfare problems, particularly through its Social Sciences and Health Services divisions. Its work and that of other child welfare agencies has been aided by recent federal legislation providing new methods for overcoming the economic and social deprivations of children. Both the Economic Opportunity Act of 1964, which established the Office of Economic Opportunity to administer anti-poverty activities, and the Civil Rights Act of 1964, which was implemented by regulations of the Department of Health, Education, and Welfare, gave child welfare agencies new weapons to use in their efforts to provide equal services and opportunities for all children.

Expansion of Services. Under the impact of this recent legislation, the range of activities included in child welfare service has been broadened considerably. However, reports from states and regions in 1964 and 1965 indicated that many problems re-

main to be solved. Confusion and overlapping of services have resulted from the development of existing programs and the initiation of new ones. Many difficulties have arisen from inadequate state legislation, the lack of professionally trained personnel, and the ferment arising from the Civil Rights Act with regard to the racial integration of public schools and other facilities.

State Legislation. All states and territories reported in their 1964 welfare plans that their legal base was adequate for extending public child welfare services to all political subdivisions, for expanding the range of services, and for improving the quality of services provided. But they also registered certain reservations, chiefly that legislation was permissive rather than mandatory, that there was no correlation between the scope and extent of services authorized and the funds allotted for them, and that certain specific enactments were necessary before services could be considered as authorized.

However, a rough assessment in 1965 by the Division of Social Services of the Children's Bureau found that only 12 of the 54 states and territories had adequate legislation, that 30 had fairly adequate laws, and that 12 had inadequate statutes. The bureau reported that some states need a basic children's welfare act, and that others need legislative revision to broaden the concept of child welfare, expand the range of services, or provide for licensing of social workers. Most states need legislation to require the provision of services and to provide funds for them.

Personnel. One of the serious problems facing

UPDEGRAFF FOR UNICEF

MATERNAL AND CHILD CARE patients await medical attention at a UNICEF-sponsored health center in Tunisia.

child welfare services is the shortage of professionally trained workers. It is estimated that 21,000 full-time workers will be needed by 1970. Positions must be classified, licensing must be standardized, and working conditions will have to be satisfactorily maintained. In 1965, three bureaus of the Welfare Administration—the Bureau of Family Services, the Children's Bureau, and the Office of Aging—held meetings to discuss these problems in five geographic areas. Two workshops for state and local staff development, held in Washington, D.C., reported their findings on the characteristics of staff development provisions.

The child welfare training program had \$3,579,455 in federal funds available for the fiscal year 1965–66, of which \$3,578,589 was actually granted. Allocations were made to schools of social work and other institutions of higher learning to provide for teaching grants, traineeships, and/or short-term training grants for qualified students.

Day-Care Programs. The Division of Social Services cooperates closely with the Office of Economic Opportunity on the problems of day-care service. A disturbing factor is the rapid increase in the number of working mothers. A preliminary report issued in 1965 by the Children's Bureau and the De-

partment of Labor's Women's Bureau estimated that there were 9.5 million working mothers, or double the number in 1950. The report forecast a 43% rise in the number of working mothers with preschool-age children by the 1970's. It also reported that the number of children under 14 with working mothers totaled 12,291,000, of whom 1,229,100 were in family or group day-care programs.

Fifty of the states and territories had approved day-care services in 1965, as against 46 in 1964. Although the available allotment for these services was the same in both years, fiscal reports from the states indicate a substantial increase in expenditure on their part. A 1965 federal appropriation act requires that the states match federal day-care funds on a 50% basis.

On May 15 a conference attended by more than 1,000 persons to discuss day-care problems was held in Washington, D.C. It was sponsored by the National Committee for the Day Care of Children, the Child Welfare League of America, and the Children's Bureau.

Education. The Elementary and Secondary Education Act of 1965 furnished great impetus to educational programs by providing special financial assistance to schools with large numbers of low-income students. (See EDUCATION.)

Anti-Poverty Programs. The Office of Economic Opportunity has established highly successful programs to combat poverty. The Job Corps was designed to remove youngsters from both city and rural slum environments and give them useful employment in corps centers, while at the same time providing them with basic education. The Neighborhood Youth Corps provided work training and work study programs in the youngsters' home towns. (See ANTI-POVERTY PROGRAM.)

Foster Family Care. Foster family care was the subject of special consideration in 1965, especially in urban districts where fewer families take in children and care for them each year. Although such programs have been difficult to finance, the Children's Bureau reported that 23 states had 4,861 children from 2,614 families in foster homes (excepting 263 in institutions) in March 1965, whereas only 12 states had 1,120 children from 466 families in foster homes in March 1962. Largely as a result of the difficulty in finding foster homes, agency-operated group homes have increased in number.

Mentally Retarded Children. It is estimated

SYBIL SHELTON FROM MONKMEYER

PROJECT HEAD START opens new vistas of learning for preschool children from the underprivileged neighborhoods in American cities. The children share play and work activities under the guidance of skilled teaching personnel.

that 34,000 mentally retarded children now receive services from public welfare agencies, and more than 5,500 from voluntary agencies.

(Information in this article was supplied by the Children's Bureau, U.S. Department of Health, Education, and Welfare.)

INTERNATIONAL PROBLEMS

The United Nations Children's Fund (UNICEF) was created to coordinate programs providing for the health and welfare of children throughout the world, and to aid in financing these programs. The 1965 Nobel Prize for peace was bestowed upon it in recognition of its work. Henry R. Labouisse, executive director of UNICEF, formally accepted the award on December 10. (See NOBEL PRIZES.)

UNICEF works in collaboration with other United Nations agencies, forming joint committees with them—in health, with the World Health Organization (WHO); in education, with the United Nations Educational, Scientific and Cultural Organization (UNESCO); and in nutrition, with the Food and Agricultural Organization (FAO).

UNICEF held its annual meeting at United Nations headquarters in June 1965 to make plans for 1965-66. It was reported that contributions from the member countries must be increased because the child population of the countries assisted by UNICEF is increasing at the rate of 2.5% annually. The UNICEF European National Committees, at their annual meeting in May at Montreux, Switzerland, reported that if the contributions of developed European countries were reckoned in terms of their gross national products they would have to be doubled to compare favorably with those of developing countries. The United States repeated its offer to increase its annual contribution if the total of contributions from other countries was increased substantially.

In 1962, UNICEF had made allocations totaling \$44 million, and expected to be able to increase this amount annually. Instead, available funds tapered off. Expenditures in 1965 fell 15% below those in 1962. Expenditures for 1966, totaling \$36,411,285 in approved commitments, were estimated at 10% below those of 1962. The Executive Committee approved allocations of \$33,708,385 for 1966, of which 62.72% is for health services, 17.22% for education, and 11.4% for nutrition.

UNICEF decided to give special attention during 1965-66 to the needs of children between the ages of one and six years. In many developing countries the mortality rate for children in this group is 40% to 50% higher than in developed countries. Even in those countries where health and economic needs of children generally are well taken care of, social and emotional problems persist for them.

The possible future role of UNICEF aid for family planning came under consideration. It was pointed out that not only was too little definitely known about the biology of human reproduction, but that each country first had to decide its own policy in regard to family planning.

MAIA WOJCIECHOWSKA won the American Library Association's 1965 John Newbery Medal for *Shadow of a Bull*—a story for teenagers about a boy who grows up in the shadow of his deceased father, a matador.

CHILDREN'S LITERATURE

Individual volumes of excellence among children's books in 1965 easily stood out from the year's generally mediocre production. The most encouraging overall trend was a willingness on the part of authors to deal realistically with contemporary social problems.

A slight drop from the previous year was recorded in the number of titles published. Preliminary figures calculated by *Publishers' Weekly*, trade journal of the book publishing industry, placed the number of books at over 2,500. Paperback publishing in the children's field continued to expand, with several publishers making their first appearance in this area. In addition, there was a discernible improvement in quality.

Awards. Several important honors were bestowed in 1965 for children's books published the previous year. The American Library Association's John Newbery Medal for the most distinguished contribution to children's literature went to Maia Wojciechowska for *Shadow of a Bull*. The association's Randolph Caldecott Medal for the most distinguished American picture book for children was given to Beni Montresor for his illustrations in *May I Bring a Friend?* Ruth Harnden received the Child Study Association's award for *The High Pastures*, as the best book dealing with problems confronting young people today.

Subjects. The year saw the usual countless volumes of mysteries and sports, as well as books of fiction and fact devoted to horses and riding. It was a good year for pirates, with a dozen volumes given to their exploits, and for Leonardo da Vinci, whose life and work was saluted in several handsome volumes. The use of Negroes in illustrations and as characters in stories continued to increase, and there were more books of fiction and history dealing with racial integration.

Fiction. The literary event of 1965 in children's book publishing was the publication of *The Animal Family*, written by poet and critic Randall Jarrell. Received with general acclaim by the critics, this

timeless, deceptively simple story about a hunter, a mermaid, a lynx kitten, a bear cub, and an orphan boy was hailed by P.L. Travers in the *New York Times* as "not so much a book as a kind of visitation . . . a paean to family life." Jarrell was tragically killed in an accident shortly before publication of the book.

The year also saw the passing of two other famous authors: Thornton W. Burgess, one of the grand old men of children's books (he created the Peter Rabbit Briar Patch series), and the equally prolific British author, Eleanor Farjeon. (See *NECROLOGY*.)

Among picture books, the most noteworthy volumes for ages four to seven were: *Oasis of the Stars*, written by Olga Economakis and illustrated by Blair Lent—a lyrical account of a young nomad's search for water; *Salt*, a Russian folktale adapted by Harve Zemach and illustrated by Margot Zemach—a prize-winning book in the *New York Herald Tribune's* Spring Book Festival; *Tom Tit Tot*, an English folktale illustrated by Evaline Ness; Alvin Tresselt's *Hide and Seek Fog*, with impressionistic illustrations of mist-shrouded Cape Cod done by Roger Duvoisin; and *Aesop's Fables*, selected and adapted by Louis Untermeyer, and illustrated by Alice and Martin Provensen.

Some outstanding books were published for children in the age group eight to twelve. The most notable were: *Drop Dead*, by Julia Cunningham—a tale with a touch of Gothic and about an orphan boy serving an isolated apprenticeship to a cruel ladder-maker; *The Empty Schoolhouse*, by Natalie Savage Carlson—a story set in Louisiana and telling how the friendship of two girls, one white and one Negro, is tested under the stress of integration; Jack Sendak's *The Second Witch*, a comic yet tragic fantasy with a prankish witch and a sensitive bear; and Rebecca Caudill's *A Certain Small Shepherd*, a poignant Christmas story.

Among the novels for young persons over twelve, the best volume was James Forman's *Ring the Judas Bell*, a story of a shepherd boy and his sister caught in the anguish and turmoil of the Greek civil war in the late 1940's. Other distinguished fiction for this age group included Harold Keith's *Komantcia*, an unflinchingly grim account of captivity among the Comanche Indians; Nat Hentoff's *Jazz Country*, which tells of a young man's efforts to break into the world of professional jazz musicians; Elizabeth Borton de Trevino's *I, Juan de Pareja*, a delicately restrained fictionalized biography of the Negro who served the 17th-century painter Velázquez; and Rosemary Sutcliff's *The Mark of the Horse Lord*, a historical novel set in 2nd century Roman Britain.

Biography. The most meritorious biographies for teenagers were Leo Gurko's *The Two Lives of Joseph Conrad*, Burke Wilkinson's narrative account of France's Henry IV in *The Helmet of Navarre*, Polly Longworth's *Emily Dickinson*, and Aylesa Forsee's *Pablo Casals*. For the same age, in the field of history, three books stood out: *Trail Drive*, Andy Adams' classic narrative about cowboy life, edited for young readers by Glen Rounds; *The Wreck of the Whaleship Essex*, Owen Chase's 1821 account of a 90-day ordeal in a whaleboat, edited by Iola Haverstick and Betty Shepard; and Betty Schechter's *The Dreyfus Affair*.

Poetry. There were several distinguished anthologies of poetry for readers in their early teens: Lillian Morrison's *Sprints and Distances*; Louise

Bogan and William Jay Smith's *The Golden Journey*; and Charles Causley's *Modern Ballads and Story Poems*. For children aged six to ten, Conrad Aiken produced a volume of 16 original poems, *Cats and Bats and Things With Wings*, superbly illustrated by Milton Glaser.

CHILE

President Eduardo Frei Montalva sought to implement a sweeping reform program in the early part of 1965, but met determined opposition in the national congress. The president's Christian Democratic party received strong support in an election in March, and the outlook for passage of key legislation brightened. The president's prestige was enhanced by his three-week trip to western Europe in July. However, economic difficulties continued to plague Chile during the year.

The Reform Program. At his inauguration in November 1964, President Frei outlined an ambitious program of social and economic reforms, which he described as a "revolution within liberty and law." His program called for the government to share in the ownership of large copper mining companies, and for land redistribution, taxes on concentrated wealth, and the reduction of inflationary pressure. Left-wing members of the congress rejected the administration's proposals as too mild, and members of center and conservative parties found them too revolutionary, so Frei was unable to proceed. Frei asked for power to legislate by decree, but congress refused to grant him that power.

Seeking to "Chileanize" foreign-owned industry, the administration reached an agreement late in 1964 with the three principal copper companies (United States private corporations) operating in Chile. The agreement provided for joint ownership by the companies and the Chilean government, for limits on taxation, and for expansion plans that would double copper production by 1970. Agreements were announced also for the joint ownership of the Chilean Telephone Company, a subsidiary of the International Telephone and Telegraph Company, and for the purchase of the Chilean Electrical Company from the American and Foreign Power Company. However, execution of the agreements was blocked in Congress, which also refused to pass the administration's proposed capital levy on personal wealth.

Elections. The congressional election on March 7, 1965, provided evidence of massive popular support for Frei's program. The Christian Democratic party won 82 of the 147 seats in the Chamber of Deputies; this was the first time since 1841 that a single party had received an absolute majority

in the lower house. The Christian Democrats also obtained 13 of 45 seats in the Senate, for a gain of 9.

The new congress, which convened in May, by November 4 had passed the administration's copper bill. Despite objections by 17,000 copper miners, who conducted a 35-day strike to obtain additional benefits, President Frei vetoed numerous amendments to the new law.

Foreign Affairs. A state visit to Europe by President Frei in July dramatized his intention of giving Chile a prominent and independent role in international affairs. Frei met with heads of state of Italy, France, Britain, and West Germany, with Pope Paul VI, and, en route, with the presidents of Argentina, Uruguay, Brazil, Venezuela, and Peru. He emphasized Chile's independence of the United States by issuing a joint statement with President de Gaulle of France that implied criticism of American military intervention in the Dominican Republic. On his return, however, Frei welcomed the assistance of both the United States and European countries in the development of Latin America.

During a tour of South America in November, Senator Robert F. Kennedy of New York conferred with President Frei. He met a hostile reception by leftist elements among university students.

Disasters. An earthquake in central Chile on March 28 lasted only 90 seconds, but caused severe damage. More than 400 people lost their lives, and 250,000 people were left homeless. The vil-

LONDON DAILY EXPRESS

CHILE'S PRESIDENT FREI sadly views bodies of copper miners buried by disastrous earthquake of March 28, 1965.

EDUARDO FREI MONTALVA, who was elected president of Chile in September 1964, received a strong mandate for his reform program in March 1965, when voters gave his Christian Democratic party a clear majority in the Chamber of Deputies. Hampered by a hostile "lame duck" Congress during the early months of his six-year presidential term, Frei had campaigned for a "parliament for the president." The election results improved chances for implementing his "profound revolution within liberty and law."

Frei was born in Santiago, Chile, on Jan. 16, 1911. While a law student at the Catholic University of Chile (1928-33), he became familiar with the social and political theories of Roman Catholic philosophers. In 1938 he left the Conservative party to help organize the National Falange, a party dedicated to Christian principles that became the nucleus of the new Christian Democratic party in 1957. Frei was minister of public works from 1945 to 1949, and a member of the Senate from 1949 to 1964.

CHILE · Information Highlights

Area: 292,256 square miles.

Population: 8,492,000 (June 30, 1964 est.).

Chief Cities (1964 est.): Santiago, the capital (Greater Santiago, 2,184,149); Valparaíso, 273,158; Concepción, 170,034; Viña del Mar, 131,479.

Government: President—Eduardo Frei Montalva (inaugurated Nov. 3, 1964). Congress—Chamber of Deputies, 147 members (party seating, 1965: Christian Democrats, 82; Radicals, 20; Communists, 18; Socialists, 15; Liberals, 6; others, 6); Senate, 45 members (party seating, 1965: Christian Democrats, 13; Radicals, 9; Socialists, 7; Communists, 6; Liberals, 5; others, 6).

Religious Faiths: Roman Catholics, 88% of population; Protestants, 7%.

Education: Literacy rate (1960)—84% of population aged 15 and over. Total school enrollment (1962)—1,557,777 (primary, 1,245,973; secondary, 178,008; teacher-training, 9,297; technical 97,315; higher, 27,184).

Finance (1964 est.): Revenues, \$755,000,000; expenditures, \$948,000,000; public debt, \$882,000,000; monetary unit, escudo (2.70 escudos equal U.S.\$1).

Gross National Product (1964): \$605,000,000.

National Income (1964): \$530,000,000; average annual income per person, \$62.

Economic Indexes (1964): Manufacturing production, 146 (1958=100) agricultural production, 124 (1955-57=100); cost of living, 400 (1958=100).

Manufacturing (metric tons, 1964): Cement, 1,266,000; crude steel, 545,000; gasoline (1963), 713,000; lumber (1963), 785,000 cubic meters; meat (1961), 199,000; sugar, 108,000; wheat flour (1963), 659,000.

Crops (metric tons, 1964-65 crop year): Wheat (1963-64), 1,304,000; potatoes, 798,000; sugar beets, 706,000; maize, 152,000; barley (1963-64), 136,000; oats (1963-64), 133,000; dry beans, 100,000.

Minerals (metric tons, 1964): Iron ore, 9,852,000 (ranks 13th among world producers); copper, 630,434 (world rank, 4th); natural gas (1963), 192,401,000 cubic feet (world rank, 8th); silver (1963), 2,390,120 troy ounces (world rank, 15th); gypsum, 130,000; manganese, 20,366; molybdenum, 3,896.

Foreign Trade (1964): Exports, \$623,000,000 (chief exports, 1963: copper ingots, \$347,000,000; iron ore, \$57,000,000; salt peter, \$30,000,000); imports, \$609,000,000 (chief imports, 1963: raw cotton and lint, \$31,000,000; electrical machinery and apparatus, \$29,000,000; cereals, \$28,000,000). Chief trading partners (1963): U.S. (took 34% of exports, supplied 35% of imports); West Germany (took 11% of exports, supplied 12% of imports); Great Britain (took 14% of exports, supplied 7% of imports).

Transportation: Roads (1964), 36,425 miles (2,074 paved); motor vehicles (1964), 146,500 (automobiles, 66,000); railways (1963), 4,857 miles; merchant vessels (1964), 48 (251,000 gross registered tons); state airline, Linea Aerea Nacional de Chile (LAN); principal airport—Santiago.

Communications: Telephones (1964): 235,046; television stations (1964), 3; television sets (1964), 50,000; radios (1962), 1,500,000; newspapers (1962), 44.

lage of El Cobre, a mining community 100 miles north of Santiago, was completely wiped out when a nearby dam broke as a result of the quake.

The earthquake followed a drought that had caused food shortages in Coquimbo and Atacama provinces. Later in the year, winter storms assailed the same region. Resulting floods caused 96 deaths, left 70,000 homeless, and strained the economy.

Economy. Economic conditions showed little improvement in 1965. Although Chile had experienced a 4% increase in real income in 1964, growth was slower in 1965. The cost of living, which had increased 38% in 1964, rose another 21% by October 1965. The government tried to limit wage increases to no more than the rise in the cost of living, but settlements were higher in the copper industry.

The balance of trade, which had shown a surplus of \$14 million in 1964, as compared with an adverse balance of \$97 million in 1963, continued to benefit in 1965 from favorable prices for copper and the curtailment of imports. In August, however, cattle purchases were slowed, and Chileans had to go without beef two days a week to reduce imports.

Chile's foreign debts totaled more than \$1.7 billion by the end of 1964, and their amortization in 1965 would have required half of Chile's export earnings. However, payments were reduced substantially by renegotiation. The United States government made available about \$110 million in loans.

CHINA

CHINA

CHINESE COMMUNIST LEADERS Liu Shao-chi and Mao Tse-tung (2nd and 3rd from left) are shown at an anti-American rally in Peking, February 10.

China, the most populous country in the world, continues to be divided into two political entities: Communist China (the People's Republic of China), situated on the mainland; and Nationalist China (the Republic of China), located on the island of Taiwan.

COMMUNIST CHINA

Communist China continued to support the Vietcong guerrillas in Vietnam in 1965, and on several occasions threatened to intervene if the United States attacked North Vietnam. The Vietnam crisis, however, did not bring Communist China and the Soviet Union together as some had expected. During the Indian-Pakistani conflict in September, Peking's ultimatum to India to withdraw from the Sikkim frontier was ignored by New Delhi, but this crisis, too, did not lead to the war. The Peking-Djakarta axis suffered a serious, if not irreparable, rupture during 1965 when the Indonesian army smashed an abortive leftist coup in September and launched a campaign against the Communists.

On the home front, Peking exploded its second nuclear device on May 14, but made little effort to celebrate the occasion. In general, life in Communist China became better in 1965 after good harvests were gathered in the Yangtze Valley and in South China. Peking tightened ideological controls by cracking down on alleged revisionist tendencies among functionaries and intellectuals.

Vietnam. Peking reacted precipitately against United States retaliatory air attacks on North Viet-

nam in February 1965. It branded the United States action as "undisguised war provocation" and warned that the Chinese people would "definitely not stand by." On February 13 the Chinese Communists declared that aggression against North Vietnam meant aggression against China and that there could be no peace in Southeast Asia so long as U.S. military forces remained there. After President Johnson stated on April 7 that the United States was ready for unconditional discussion to end the war in Vietnam, both Peking and Hanoi rejected the offer as a "hoax."

But in spite of its militant statements, Communist China avoided direct involvement in the war in Vietnam. It increased its shipment of military equipment and war materials to North Vietnam, but not the size of its personnel. Peking's basic policy was revealed by Ch'en Yi, the foreign minister, when he declared that Communist China would intervene if U.S. forces crossed the 17th parallel or if the existence of the North Vietnamese government was threatened. He undoubtedly meant crossing by ground forces, for subsequent U.S. air strikes against North Vietnam did not lead to Peking's armed intervention. The United States position that there would be no territorial sanctuary for Communist China if it became directly involved in the war, and the possibility that the United States might take advantage of the war to destroy China's nuclear installations, were two weighty factors that undoubtedly deterred the Peking government from taking rash actions.

sion" that threatened the peace of Asia. On the following day, Peking delivered a note to the Indian government protesting against "military aggression and provocation" along the border between Tibet and Sikkim, an Indian protectorate. As the world watched with anxiety, an ultimatum was handed to the Indian envoy in Peking on September 16, demanding that India withdraw its troops and dismantle its fortifications along the Sikkim-Tibet border in three days, or face "grave consequences." On September 19, Peking extended the deadline by three days.

In the meantime, Communist Chinese troops reportedly began to fire across the border in two sections—the Sikkim area in the east and the Ladakh region in the west. Then, on September 21, as suddenly as it had issued the ultimatum, Peking announced that India had dismantled its military installations along the Sikkim border, as China had demanded. China also surreptitiously withdrew its troops from positions near the Sikkim border.

Relations with the Soviet Union. When the United States first launched retaliatory air strikes against North Vietnam, the Soviet Union made a strong appeal for unity in the Communist world. It soon became apparent, however, that the ideological and policy differences between Moscow and Peking were too deeply rooted to be resolved on the basis of a temporary need for cooperation. An inauspicious event in relations between the two countries occurred on March 4, when a Chinese-led demonstration by Asian students in Moscow to protest U.S. air attacks on North Vietnam was forcibly quelled by Soviet police and troops. Peking immediately protested, charging the Russians with "police brutality" and demanding that the Soviet government apologize to the students and punish the police officials involved. Moscow rejected the demands.

Subsequently, Peking accused Moscow of following "a line of compromise and capitulation that encouraged the imperialist forces of aggression." The parallel action taken by the Soviet Union and the United States in helping to formulate a cease-fire under the auspices of the United Nations in regard to the Indian-Pakistani war was cited as evidence of Moscow's betrayal of the Communist cause by working "hand-in-glove with U.S. imperialism."

The Asian-African Conference. To limit Soviet influence in Asia and Africa, Communist China stubbornly opposed the participation of the Soviet Union in an Asian-African conference, originally scheduled to open in Algiers on June 29. Peking insisted that the Soviet Union, with two thirds of its population in Europe, was not an Asian country. Premier Chou En-lai went to Algiers in March to seek Algerian backing for the exclusion of the Soviet Union from the conference, but failed to obtain the necessary support. When Algerian President Ahmed Ben Bella, who was friendly to the Soviet Union, was overthrown by a coup on June 19, Peking immediately recognized the new regime headed by Col. Houari Boumedienne.

Although both Chou En-lai and President Nasser of the United Arab Republic urged that the conference open on schedule, it was postponed until November 5, to the disappointment and frustration of Peking. Later, when it became apparent that Peking was not able to prevent conference sponsors from issuing an invitation to Moscow, Peking decided to boycott the conference. As a result, the conference was postponed indefinitely.

Military Strategy. Because of its vulnerability to aerial attacks, Peking saw the advantage of fighting the war by proxy. Its immediate objective was to have the Vietcong mire U.S. forces in South Vietnam. Its long-range strategy was to encircle the West by inciting similar revolutionary wars in other underdeveloped countries. In an article published on September 3 in *Jen Min Jih Pao*, the official Chinese Communist newspaper, Marshal Lin Biao, the minister of defense, envisaged "people's wars" in Asia, Africa, and Latin America, which would defeat the "American colossus piece by piece." The idea was derived from Mao Tse-tung's military strategy of establishing revolutionary bases in rural areas so that the urban centers would be outflanked and conquered. In international terms, North America and western Europe are analogous to the cities, and Asia, Africa, and Latin America are analogous to the rural areas.

Ultimatum to India. The border war in 1962 between Communist China and India strained relations between the two countries, with Peking maintaining close ties with Pakistan, India's perennial antagonist, and with India looking to both the Soviet Union and the United States for increased aid. Many times in 1965, Peking and new Delhi accused each other of border intrusions.

When armed conflict between India and Pakistan along the Kashmir truce line erupted into war in September, Peking sided with Pakistan. On September 7, Communist China declared that India's military thrust into Pakistan represented "naked aggres-

SOVfoto

MAO TSE-TUNG, the 72-year-old chairman of the Chinese Communist party (above, with Soviet Premier Khrushchev), remained the number one man in China in 1965. He was hailed by other Chinese leaders for his contributions to the theory and tactics of armed revolutionary struggle. Countries in Asia, Africa, and Latin America were urged to adopt his theory of revolutionary war as the basic strategy of achieving world communism. Mao appeared in photographs to be in good health despite contrary reports.

Mao was born in 1893 in Shao Shan, Hunan province, China. He joined Sun Yat-sen's Revolutionary Army in 1911, and 10 years later helped to found the Chinese Communist party. In 1931, Mao was elected chairman of the first All-China Congress of Soviets. After the Communist victory over the Nationalists in 1949, he became chairman of the People's Republic of China. He resigned this office in April 1959, but retained the powerful position of chairman of the Communist party Politburo.

UPI

CHOU EN-LAI, the 67-year-old premier of Communist China, is his country's chief spokesman to the outside world. In 1965 he visited many African and Asian countries (above, he is with Sukarno in Indonesia). In each country he repeated his attacks on U.S. actions in Latin America, Vietnam, and the Congo, and proposed the creation of a new United Nations that would be free of the "manipulation of United States imperialism." He also attempted to exclude the Soviet Union from the Afro-Asian conference that was to have been held in Algiers.

Chou was born in 1898 in Kiangsu province, China. He joined the newly founded Chinese Communist party in 1921 and the Kuomintang-Communist alliance in 1924. After the Nationalists and Communists split, he organized the nucleus of the Communist Chinese army. Chou continued to rise in the Communist party during the long civil war with the Nationalist forces, and, following the Communist victory in 1949, he became the first premier of Communist China.

Relations with Other Countries. Communist China launched vigorous diplomatic offensives in Africa and Asia for the dual purpose of undermining Soviet influence and encircling "Western imperialism led by the United States." While Premier Chou En-lai visited Algeria and the United Arab Republic in March and April, Foreign Minister Ch'en Yi toured Afghanistan, Pakistan, and Nepal. Peking became virtually the dominant power behind the Congo (Brazzaville) government in its efforts to build a "scientific Socialist state." It also succeeded in getting President Julius K. Nyerere of Tanzania to denounce United States involvement in Vietnam.

But Peking also had its frustrations. On Jan. 30,

1965, Burundi severed relations with China. In Kenya and Malawi, Peking was denounced for dubious activities and improper interference.

During his visit to Indonesia in August, Foreign Minister Ch'en Yi reportedly reached an understanding with President Sukarno to form a bilateral arrangement that would outflank United States positions in Southeast Asia. This Peking-Djakarta axis was shaken to its foundations, however, by an abortive leftist coup in Indonesia on September 30. After crushing the coup, Indonesian army leaders launched a violent campaign against the Communists. Under army pressure, President Sukarno, who had attempted to arbitrate the dispute between

Manufacturing (metric tons, 1964): Crude steel, 13,600,000; cement, 10,500,000; cotton yarn (1960), 1,632,600; sugar, 2,110,000; aluminum, 100,000.

Crops (metric tons, 1964): Rice (1963), 78,400,000 (ranks 1st among world producers); soybeans, 10,770,000 (world rank, 2nd); peanuts, 2,291,000 (world rank, 2nd); tea, 158,800 (world rank, 3rd).

Minerals (metric tons, 1964): Coal 290,000,000 (ranks 1st among world producers); iron ore, 37,000,000 (world rank, 4th); salt, 11,000,000 (world rank, 2nd); manganese, 1,000,000 (world rank, 5th); gypsum, 590,000 (world rank, 14th); bauxite, 406,000 (world rank, 16th); crude petroleum, 62,050,000 barrels (world rank, 19th); lead, 100,000 (world rank, 8th); zinc, 100,000 (world rank, 11th).

Foreign Trade (1963): Exports, \$1,600,000,000; imports, \$1,100,000,000. Chief trading partners (1962): USSR (took 31% of exports, supplied 12% of imports); Albania (took 28% of exports, supplied 11% of imports).

Transportation: Roads (1958), 249,000 miles; motor vehicles (1963), 230,300 (automobiles, 32,700); railways (1963), 19,500 miles; merchant vessels (1964), 166 (613,000 gross registered tons); interior airlines (1964), 20.

Communications: Telephones (1948), 244,028; television stations (1964), 26; television sets (1964), 100,000; radios (1963), 8,000,000; newspapers (1955), 392 (daily circulation, 12,000,000).

the army and the Indonesian Communists, reportedly considered creating a new Indonesian Communist party purged of Chinese influence. Thus, Peking's relations with Djakarta appeared to be as uncertain as Indonesia's political situation.

United Nations. On Nov. 17, 1965, by a tie vote of 47 to 47, the UN General Assembly again denied Communist China a seat in the world body. An earlier resolution of the assembly had stipulated the issue of Chinese representation an important question, the decision of which would require a two-thirds majority of the members present and voting. Following the vote, *Jen Min Jih Pao* commented that "the United States may keep China out of the United Nations for 1,000 or even 10,000 years without harming China one iota." The Chinese Communist newspaper also indicated that Peking would not want to be a member unless the United Nations would free itself "from the control of the United States, rectify all its mistakes, and undergo a thorough reorganization and reform." Earlier in the year, Premier Chou En-lai had twice suggested the establishment of a "revolutionary United Nations unless the world organization purges itself."

Economy. Drought was reported in northeastern and western China in 1965, but emergency work by millions of peasants salvaged the summer harvest in a number of provinces. Bountiful crops were harvested in the Yangtze Valley and South China. Government officials estimated that overall agricultural production in 1965 would be higher than that of the preceding year.

While food output was returning to the level reached during the period immediately preceding the disastrous 1958 "great leap forward" campaign, agricultural production was unable to keep up with the demand created by the increase in population. However, life in China in 1965 was generally better than it was three years before, when food shortages were critical. In Canton, for example, the markets were well stocked with meat, poultry, fish, and vegetables. Rice and edible oils were still rationed throughout China, though less stringently.

Nuclear Test. Communist China exploded its second atomic device in the atmosphere on May 14, just seven months after its first nuclear test. The use of the more technically advanced uranium-235 as the explosive material led specialists to speculate that Communist China might develop a hydrogen bomb in a few years.

Peking calmly announced its second nuclear explosion. There was no organized demonstration to celebrate the event, and the brief official announcement was tempered by a statement that Communist China was developing nuclear weapons "solely for defensive purposes."

Military Affairs. Its nuclear successes notwithstanding, Communist China emphasized the role of its ground forces in its call for "realistic" preparation for nuclear war. The correct strategy against the United States, wrote General Lo Jui-ch'ing, chief of staff of the Chinese army, was "active defense" which would sacrifice territory to gain time and prepare for a counterattack and offensive by ground troops that would pursue and destroy the enemy "in his nest." In January 1965 the enlistment periods for land forces and special branches of the army were lengthened by one year and two years, respectively. The move was intended to give the soldiers better training in the use of advanced infantry weapons.

Steps were also taken by the Chinese Communists

to tighten control over the army. In a decree published on May 25, Peking announced that generals and other officers would no longer wear insignia signifying rank. Political control of the army through party commissars was strengthened to ensure that "the party will control the gun, and the gun will never be allowed to control the party."

Ideological Struggle. Sympathy with so-called revisionism was found among an increasing number of party and government functionaries. According to *Jen Min Jih Pao*, some teachers of political theory "harbor revisionist views and distort and obliterate the thought of Mao Tse-tung by every conceivable means." Resentment against political pressure was also reported among young scientists and other intellectuals, who deplored the practice of holding so many political meetings and disagreed with the system of strict ideological control.

In a counterattack on these "heretical tendencies," Peking called for a militant class struggle that would turn every school campus into "an arena where the proletariat and the bourgeoisie are locked in violent combat." Books for children were to stress stories "stained with blood and tears" in the struggle against capitalism. A campaign against "Western bourgeois music" was launched in April; works by such classical Western composers as Ludwig van Beethoven were denounced as undesirable because they tended to create illusions of universal love and thus had paralyzing effects on "the revolutionary fighting will" of the listeners. Peking sounded the death knell of traditional operas and dramas when, at the close of a festival in August, it declared that modern plays should henceforth "completely eclipse traditional ones both in political and ideological content and in artistic quality."

Frontier Regions. Tibet was given the status of an autonomous region on Sept. 1, 1965. The change, however, did not affect Peking's absolute control over the region, since the local government remained, in reality, an agency through which Peking's decisions were channeled and implemented. Sporadic

SECOND NATIONAL GAMES were held in Peking in September. Athletes from the Tibetan Autonomous Region lead the ceremonial parade into the stadium on the opening day.

revolts by Khamba tribesmen were reported in Tibet, where, in the words of the Chinese Communists, the class struggle remained "protracted and complicated."

In February 1965, in the Sinkiang-Uigur region, a reform of the written language of Muslim minorities was ordered by the Chinese government. The Arabic script of the Uigur and Kazakh minority groups was to be replaced by a modified Latin alphabet based on a phonetic system for writing Chinese. The program was a step in the direction of assimilating the two groups.

NATIONALIST CHINA

Much of Nationalist China's diplomatic activity in 1965 was directed toward winning international support for the formation of an anti-Communist alliance in Asia. Internally, Taiwan's economy showed sufficient strength to survive the termination of United States economic aid, while the death of Vice President Ch'en Ch'eng left open the question of presidential succession.

Foreign Relations. In the face of Peking's threatening gestures in support of North Vietnam, Nationalist China reemphasized the theme that no peace in Asia could be maintained before effective actions were taken to crush Communist China. On March 29, 1965, President Chiang Kai-shek called for a three-stage strategy to recover the mainland: (1) the destruction of the Chinese Communist nuclear installations; (2) a popular uprising on the Chinese mainland; and (3) a quick breakthrough of Communist China's coastal defenses. To carry out this strategy, U.S. cooperation was necessary.

In August, Madame Chiang Kai-shek flew to the United States for her first visit in six years. In September, Chiang Ching-kuo, the minister of defense and son of President Chiang, paid a 10-day official visit to the United States. Although there was no indication that Washington encouraged the opening of a second battle front in Asia, both Madame Chiang and Chiang Ching-kuo expressed confidence that the Nationalists would recover the Chinese mainland in the near future.

In the summer, Foreign Minister Shen Ch'ang-huan paid official visits to New Zealand, Australia, and Japan. The main purpose of these trips was to promote in Asia an anti-Communist alliance of which South Korea and South Vietnam had already expressed approval. New Zealand and Australia, however, were more interested in having a meeting of the region's foreign ministers than in creating a stronger anti-Communist alignment.

In Japan, Shen Ch'ang-huan was confronted with the strong desire by Japanese officials to expand trade with Communist China, and he appealed to them to limit their trade with Peking. He emphasized the significance of former Japanese Prime Minister Shigeru Yoshida's letter to President Chiang in April 1964, in which Yoshida gave assurances that the Japanese government would not encourage trade with the Chinese Communists. Japanese officials were vague toward Shen's bid, but they expressed the desire to promote friendly relations with Taiwan. On September 22, Nationalist China and the Japanese Export and Import Bank signed an agreement to utilize Japan's yen credit of \$106 million to de-

NATIONALIST CHINA · Information Highlights

ASIA

Area: 13,885 square miles.

Population: 12,429,000 (June 30, 1965 est.).

Chief Cities (1963 est.): Taipei, the capital, 1,027,648; Kaohsiung, 539,771; Tainan, 375,101; Taichung, 336,280; Keelung, 258,412.

Government: President—Chiang Kai-shek (took office in 1948); Premier—Yen Chia-kun (took office in 1963). Parliament—National Assembly (1,521 members).

Religious Faiths: Roman Catholics, 2% of population; Protestants, 2%; Muslims, 3%.

Education: Literacy rate (1964)—96.7% of population aged 12 and over. Total school enrollment (1962–63)—2,605,635 (primary, 2,097,957; secondary, 366,313; teacher-training, 5,318; technical, 91,733; higher, 44,314).

Finance: Revenues (1964), \$266,350,084; expenditures (1964) \$292,552,953; monetary unit (1965), New Taiwan dollar (NT\$40 equal U.S.\$1).

Gross National Product (1964): \$2,352,000,000.

National Income (1964): \$1,921,400,000; average annual income per person, \$160.

Economic Indexes (1964): Industrial production, 222 (1958=100); agricultural production, 136 (1956–57=100); cost of living, 148 (1958=100).

Manufacturing (metric tons, 1964): Cement, 2,355,000; sugar, 870,000; wheat flour, 247,000; gasoline (1963), 243,000; meat (1963), 220,000; cotton yarn, 50,520; aluminum, 17,749.

Crops (metric tons, 1964): Rice, 2,795,000 (ranks 13th among world producers); tea, 18,300 (world rank, 8th); sweet potatoes and yams, 3,383,000; cassava (1963), 217,000; peanuts, 116,000; citrus fruits, 67,000; tobacco, 17,100; jute, 17,000.

Minerals (metric tons, 1964): Salt, 602,000 (ranks 19th among world producers); bituminous coal, 5,027,000; clays, 1,014,000; lime, 92,000; pyrites, 46,700; iron ore, 7,100; copper, 1,738; silver, 60,633 troy ounces; gold, 17,660 troy ounces.

Foreign Trade (1964): Exports, \$433,000,000 (chief exports: sugar, \$128,000,000; rice, \$20,000,000; tea, \$7,900,000); imports, \$428,000,000 (chief imports, 1963: raw cotton, \$40,000,000; wheat and maslin, unmilled, \$27,700,000; iron and steel, \$25,100,000). Chief trading partners (1963): Japan (took 32% of exports, supplied 30% of imports); U.S. (took 16% of exports, supplied 42% of imports); South Vietnam (took 10% of exports, supplied 0.2% of imports).

Transportation: Roads (1964), 10,135 miles (1,777 paved); motor vehicles (1964), 30,456 (automobiles, 11,992); railways (1963), 2,308 miles; merchant vessels (1964), 103 (639,000 gross registered tons); national airlines, Civil Air Transport and Foshing Airlines; principal airports, Hualien, Kaohsiung, Keelung, Sungshan.

Communications: Telephones (1964), 132,524; television stations (1964), 2; television sets (1964), 18,000; radios (1963), 1,114,000; newspapers (1963), 32 (daily circulation, 750,000).

velop Taiwan's economy. The credit was part of the Japanese government's \$150 million loan to assist development projects in Taiwan over a period of five years.

Termination of U.S. Aid. United States economic aid was formally phased out on June 30, 1965. But military aid was continued, and an estimated \$178 million worth of materials and services under the economic aid program remained to be delivered within three years. In addition, development funds jointly established in July by Nationalist China and the United States were to provide an estimated \$250 million for economic and social projects in the next five years. The money was to come from payments for U.S. aid-financed equipment, repayment of U.S. loans, and proceeds from the sale of United States surplus agricultural products. Nationalist China, commended as being one of the countries to have used American aid most successfully, found itself well on the path of economic development in 1965.

Economy. To facilitate industrialization, Taiwan planned to develop seven new industrial districts. Scheduled for development in 1965 were two districts at Kwei Shan and Ting Kan, both near Taipei, and one at Toufen, in Miaoli county.

Taiwan registered healthy growth in both the industrial and agricultural sectors of the economy in 1965. In spite of the plunging sugar price, income from sugar exports was relatively high.

Government. A major development of the political scene was the return to Taiwan in May of Thomas Liao, who formerly headed the so-called Taiwan Independence Movement and who had been a political refugee in Japan and other countries. He renounced the independence movement, which rapidly collapsed as one leader after another gave up the idea of Taiwan's secession from China. Upon his return, Liao was immediately pardoned by President Chiang.

The death of 67-year-old Vice President Ch'eng Ch'eng on March 5, 1965, was mourned in Taiwan. (See *NECROLOGY*.) As vice president, he was the

legal successor to the president, should the office become vacant. His death made the question of presidential succession more pressing than before.

Sea Battles. On May 1 a Nationalist patrol boat won a battle with a number of Communist gunboats, some 35 miles off the Matsu Islands. In another sea battle fought in the Formosa Strait on August 6, three Communist vessels were sunk and two Nationalist ships were lost. The sea engagements did not lead to large-scale military action between Nationalist and Communist China.

CHRISTIAN CHURCHES (Disciples of Christ)

In the year 1965 worldwide membership in the Christian Churches (Disciples of Christ) totaled 2,153,599 persons, organized in 9,313 congregations. There were 218 missionaries and 2,009 national leaders serving in 13 fields. Church contributions for missionary, benevolent, and educational purposes totaled \$13,246,726. The amount contributed in 1965 for all work, at home and abroad, was \$93,346,814. Unified Promotion, the central receiving agency for missionary funds, received \$12,173,417. The pension fund reported total assets in 1965 of \$53,794,258.

In 1965, 13 Regional Assemblies were held in various parts of the United States between October 6 and 23. The 1966 Assembly will be held in Dallas, Texas, September 23–28.

New members of the Christian Churches totaled 92,252. This figure included 42,395 baptisms in the United States and Canada, and 49,857 transfers.

Ecumenical concerns were underwritten in part through the annual offering of the Week of Compassion, which in 1965 totaled \$582,421. This fund was distributed for relief, rehabilitation, and educational services of the World Council of Churches and the National Council of Churches.

The headquarters of the Christian Churches (Disciples of Christ) are at 221 Ohmer Avenue, Indianapolis, Ind. This denomination's publications include *World Call*, a monthly, and *The Christian*, a weekly.

A. DALE FTERS
Executive Secretary

CHRISTIAN SCIENCE

In 1965, Christian Scientists set up new lines of communication with other churches and initiated efforts to identify basic areas of agreement between Christian Science and the other denominations. These efforts were in keeping with the theme of unity among races and religions stressed at the annual meeting in June of The Mother Church, The First Church of Christ, Scientist, in Boston, Mass. At this meeting Frances S. Wells of San Antonio, Texas, was elected president of The Mother Church.

Ralph E. Wagers, past church president and associate editor of religious periodicals, was appointed manager of the Board of Lectureship. Other lecturing appointments included Josephine H. Carver of Boston, Norman B. Holmes of Chicago, Glenn L. Morning of San Francisco, Jane Robbins of Boulder, and Edward C. Williams of Indianapolis.

The *Christian Science Monitor* appeared in a new five-column format in 1965, and doubled the size of its staff in an effort to achieve broader national and international news coverage.

In July the Christian Science Board of Directors announced plans for a 15-acre "church center" to accommodate the expanding headquarters activities in Boston. In August more than 4,500 college and university students from around the world attended the Biennial Meeting for Christian Science College Organizations held in Boston, Mass.

The Christian Science Pavilion at the New York World's Fair opened its doors during the 1965 season to several hundred thousand visitors.

New translations of the writings of Mary Baker Eddy were made in the Arabic, Efik, Finnish, Hebrew, and Hungarian languages.

DAVID E. SLEEPER

The First Church of Christ, Scientist, Boston

CHRONOLOGY, 1965. See the listing of important dates and the Topical Survey of the year's important events on pages 2 to 20.

CHURCH MEMBERSHIP, U.S. See RELIGION.

CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS

In 1965 the church had 3,749 wards and independent branches in 400 stakes (territorial units), and 2,038 branches in 74 missions. There were approximately 16,275 missionaries serving in the missions and stakes throughout the world. Total church membership was 2,234,916, including 93,483 convert baptisms.

In 1965 the North Scottish Mission was made a part of the Scottish Mission, the Northeast British Mission was combined with the North British Mission, and the Bavarian Mission became part of the South German Mission. The British South Mission was organized from parts of the British Mission and the Southwest British Mission, and the Guatemalan-El Salvadoran Mission was created from a division of the Central American Mission.

On Oct. 29, 1965, President David O. McKay se-

lected Joseph Fielding Smith and Thorpe B. Isaacson to serve as additional counselors in the First Presidency. Other counselors are Hugh B. Brown and N. Eldon Tanner.

In January, upon special invitation, the Salt Lake Mormon Tabernacle Choir participated in President Lyndon B. Johnson's inauguration. This choral program was broadcast to the world on radio and television by means of a Telstar communications satellite.

A record crowd of more than 100,000 witnessed the annual Hill Cumorah Book of Mormon pageant near Palmyra, N.Y.

The church introduced a new program of teaching and living the Gospel in the home. This provides for weekly home meetings where parents discuss Gospel truths with their children. The program is implemented by courses of instruction in the ward and stake priesthood quorums and at meetings of women's and children's organizations.

The Correlation Committee's emphasis upon the priesthood home teaching, welfare, genealogical, and temple programs, together with cultural and character-building activities of the auxiliaries among the young and old, gave new impetus to these programs.

A new plan of mission supervision enlarged the world assignments of the Council of the Twelve and others of the General Authorities. It divides the missions of the world into 12 large areas. A member of the Twelve will be directly in charge of each area, and will be aided by one or more assistants.

JOSEPH ANDERSON
Secretary to the First Presidency

CIGARETTES AND CIGARS. See TOBACCO.

CHURCHES OF CHRIST

The 2.5 million members of the Churches of Christ in 1965 placed renewed emphasis on promoting their plea for Christian unity based on the teachings of the New Testament alone. Church "Exodus" movements and "Inner City" programs emerged, and foreign mission activities, campaigns at home and abroad, and radio and television programs increased.

Exodus/Bay Shore, involving 60 families who moved in 1963 from the South and West to Long Island, New York, where they established the West Islip Church of Christ, furnished the inspiration for other groups. These groups prepared to move and exert a religious influence on their new neighbors.

The group of families from the Golf Course Road Church of Christ in Midland, Texas, who planned to move to Somerset County, N.J., in 1966, gave this explanation of their purpose. "Exodus/New Jersey is a creative adventure in faith planned for some 100 or more families—vocational missionaries—who will make a permanent move in August of 1966 to Somerset County, N.J., to establish a strong non-denominational church patterned after the doctrine of the New Testament."

"Inner city" areas, with their socially, economically, and morally deprived families, are increasingly attracting the attention of Churches of Christ. The Brookline (Mass.) Church of Christ, through its House of the Carpenter, led the way for similar programs in Chicago and Philadelphia.

President, Northeastern Christian Junior College

CHURCHILL, Sir Winston

British on his father's side, American on his mother's, Sir Winston Leonard Spencer Churchill embodied and expressed the double vitality and the national qualities of both peoples. His names testify to the richness of his historic inheritance: Winston, after the Royalist family with whom the Churchills married before the English Civil War; Leonard, after his remarkable grandfather, Leonard Jerome of New York; Spencer, the married name of a daughter of the 1st duke of Marlborough, from whom the family descended; Churchill, the family name of the 1st duke, which his descendants resumed after the Battle of Waterloo. All these strands come together in a career unparalleled in British history for richness, range, length, and achievement.

Churchill took a leading part in laying the foundations of the welfare state in Britain, in preparing the Royal Navy for World War I, and in settling the political boundaries in the Middle East after the war. In World War II, he emerged as the leader of the united British nation and Commonwealth to resist the German domination of Europe, as an inspirer of the resistance among free peoples, and as a prime architect of victory. In this, and in the struggle against communism afterward, he made himself an indispensable link between the British and American peoples, for he foresaw that the best defense for the free world was the coming together of the English-speaking peoples. Profoundly historically minded, he also had prophetic foresight: British-American unity was the message of his last great book, *A History of the English-Speaking Peoples*.

His dominant qualities were courage—he did not know what fear was—and imagination. Less obvious to the public, but no less important, was his powerful, original, and fertile intellect. He had intense loyalty, marked magnanimity and generosity, and an affectionate nature with a puckish humor. Oratory, in which he ultimately became a master, he learned the hard way, but he was a natural wit. The artistic side of his temperament was displayed in his writings and oratorical style, as well as in his paintings. He was a combination of soldier, writer, artist, and statesman. He was not so good as a mere party politician. Like Julius Caesar, he stands out not only as a great man of action, but as a

Important Dates in Churchill's Life

Born at Blenheim Palace, Nov. 30, 1874.
 Graduated with honors from Sandhurst, December 1894.
 Entered the British army, March 1895.
 Taken prisoner by Boers in South Africa, November 15, 1899; escaped Dec. 12, 1899.
 Elected to Parliament as Conservative M.P., 1900.
 Elected as Liberal M.P., 1906.
 Named undersecretary of state for the colonies, 1906.
 Married Clementine Ogilvy Hozier, Sept. 12, 1908.
 Became first lord of the Admiralty, Oct. 23, 1911.
 Demoted after Dardanelles campaign, May 1915; resigned from government, November 1915.
 Returned to Conservative party; appointed chancellor of the exchequer, 1924.
 Resigned from cabinet, June 1929.
 Became prime minister, May 10, 1940.
 Signed Atlantic Charter during meeting with Roosevelt aboard ship off Newfoundland, Aug. 9–12, 1941.
 Addressed joint session of U.S. Congress, Dec. 26, 1941.
 Met with Roosevelt and Stalin at Teheran, Nov. 27–Dec. 2, 1943; at Yalta, Feb. 4–11, 1945.
 Resigned as prime minister, April 5, 1955.
 Warned West of Soviet aims, at Fulton, Mo., March 15, 1946.
 Took office as prime minister, Oct. 26, 1951.
 Resigned as prime minister, April 5, 1955.
 Proclaimed honorary citizen of the U.S., April 9, 1963.
 Died in London, Jan. 24, 1965.

Sir Winston Churchill flashes his famous "V" for victory signal, symbolizing his determination to win World War II. UPI

writer of it too. He had genius; as a man he was charming, gay, ebullient, endearing.

As for personal defects, such a man was bound to be a great egoist—if that is a defect. So strong a personality was apt to be overbearing. He was something of a gambler, always too willing to take risks. In his earlier career, people thought him of unbalanced judgment partly from the very excess of his energies and gifts. That is the worst that can be said of him. With no other great man is the familiar legend more true to the facts. We know all there is to know of him.

Young Churchill: 1874–1900. He was born on Nov. 30, 1874, at Blenheim Palace, the famous palace near Oxford built by the nation for John Churchill, 1st duke of Marlborough, the great soldier. Blenheim, named after Marlborough's grandest victory (1704), meant much to Winston Churchill. In the grounds there he became engaged to his future wife, Clementine Ogilvy Hozier (b. 1885). He later wrote his historical masterpiece, *The Life and Times of John Churchill, Duke of Marlborough*, with the archives of Blenheim behind him.

His father, Lord Randolph Churchill, was a younger son of the 7th duke of Marlborough. His mother was Jennie Jerome; and as her mother, Clara Hall, was one-quarter Iroquois, Sir Winston had an Indian strain in him. Lord Randolph, a brilliant Conservative leader who had been chancellor of the exchequer in his 30's, died when only 46, after ruining his career. His son wrote that one could not grow up in that household without realizing that there had been a dis-

(Continued on page 170)

PICTORIAL PARADE: 1880

She shone for me like the evening star, Churchill said of his mother, the former Jennie Jerome of New York. She always seemed...like a fairy princess.

UPI: 1884

By being so long in the lowest form, he wrote about his school days at Harrow, I was taught English. I got into my bones the essential structure of an ordinary English sentence—which is a noble thing.

UPI: 1898

Talk of fun! Where will you beat this! He thus described his experience as an army officer in Africa when he was in his early 20's.

SIR WINSTON CHURCHILL (1874-1965)

UPI: 1941

As British prime minister in World War II, he roused his countrymen with the inspiring words: You ask, what is our policy? I will say: It is to wage war, by sea, land and air, with all our might and with all the strength that God can give us....Without victory, there is no survival.

In the 1940 Battle of Britain, when nightly air raids reduced large parts of England's great cities to rubble, Churchill exhorted his countrymen: Let us therefore brace ourselves to our duties, and so bear ourselves that, if the British Empire...last for a thousand years, men will still say, "This was their finest hour."

UPI: 1940

He was knighted by Elizabeth II in 1954. In 1952, on the accession of the young queen, he had said: I, whose youth was passed in the...Victorian era, may well feel a thrill in invoking..."God Save the Queen."

BRITISH INFORMATION SERVICES: 1955

In 1952, Churchill addressed a joint session of the U.S. Congress for the fourth time. In his first speech to Congress (1941) he had said: I cannot help reflecting that if my father had been an American and my mother British, instead of the other way round, I might have got here on my own.

UPI: 1952

UPI: 1908

I married and lived happily ever after, he wrote of his marriage to Clementine Hozier in 1908.

I am finished were his words upon learning of his dismissal as first lord of the admiralty in 1915, after the failure of the Dardanelles campaign which he had supported. Almost immediately, he went to France as an officer in the 2nd Grenadier Guards.

In War: Resolution • In Defeat: Defiance • In Victory: Magnanimity • In Peace: Goodwill

We shall not flag or fail, he promised the British people. We shall fight on the seas and oceans...we shall fight on the beaches, we shall fight in the fields and in the streets...we shall never surrender.

UPI: 1945

ACME: 1946

From Stettin in the Baltic to Trieste in the Adriatic, an iron curtain has descended across the continent, he said in his famous speech at Fulton, Mo., in March 1946.

At 77, Churchill again campaigned for his seat in Commons. Three years later, as prime minister, he said: If I stay on...it is because I have the feeling that I may...have an influence on what I care about above all else—the building of a sure and lasting peace.

ACME: 1951

UPI: 1965

He was unafraid of death. I am prepared to meet my Maker, he once quipped. Whether my Maker is prepared for the great ordeal of meeting me is another matter. In a more serious vein, he said of death: Only faith in a life after death...can give consolation.

aster in the background. It was an early spur to him to try to make up for his gifted father's failure, not only in politics and in writing, but on the turf. Young Winston, though the grandson of a duke, had to make his own way in the world, earning his living by his tongue and his pen. In this he had the comradeship of his mother, who was always courageous and undaunted.

In 1888 he entered Harrow, but he never got into the upper school because, always self-willed, he would not study classics. He concentrated on his own language, willingly writing English essays, and he afterward claimed that this was much more profitable to him.

In 1894 he graduated from the Royal Military College at Sandhurst. He then was commissioned in the 4th Hussars. On leave in 1895, he went for his first experience of action to serve as a military observer and correspondent with the Spanish forces fighting the guerrillas in Cuba.

Rejoining his regiment, he was sent to serve in India. Here, besides his addiction to polo, he went on seriously with his education, which in his case was very much self-education. His mother sent out to him boxes of books, and Churchill absorbed the whole of Gibbon and Macaulay, and much of Darwin. The influence of the historians is to be observed all through his writings and in his way of looking at things. The influence of Darwin is not less observable in his philosophy of life: that all life is a struggle, the chances of survival favor the fittest, chance is a great element in the game, the game is to be played with courage, and every moment is to be enjoyed to the full. This philosophy served him well throughout his long life.

In 1897 he served in the Indian army in the Malakand expedition against the restless tribesmen of the North-West Frontier, and the next year appeared his first book, *The Story of the Malakand Field Force*. In the same year, 1898, he served with the Tirah expeditionary force, and came home to seek service in General Kitchener's campaign for the reconquest of the Sudan. Once again young Churchill managed to play the dual role of active officer and war correspondent. As such he took part at Omdurman in one of the last classic battles of earlier warfare—cavalry charges, a thin red line of fire against clouds of fanatical dervishes. The Battle of Omdurman was the end of a world. Once more Churchill wrote it up, and the whole campaign, in *The River War* (2 vols., 1899), a fine example of military history by an eyewitness. He made enemies among the professional soldiers by his frank criticisms of army defects. He entertained himself by writing a novel, *Savrola* (1900), which curiously anticipates later developments in history, war, and in his own mind.

On the outbreak of the South African War in 1899, he went out as war correspondent for the *London Morning Post*. Within a month of his arrival, he was captured when acting more as a soldier than as a journalist, by the Boer officer Louis Botha (who subsequently became the first prime minister of the Union of South Africa and a trusted friend). Taken to prison camp in Pretoria, Churchill made a dramatic escape and traveled, with a price of £25 on his head, via Portuguese East Africa back to the fighting front in Natal. His escape made him world-famous overnight. He described his experiences in a couple of journalistic books and made a first lecture tour in the United States. The proceeds from the

tour enabled him to enter Parliament (M.P.'s were not paid in those days).

Rising Politician: 1901-1915. On Jan. 23, 1901, Churchill became member of Parliament for Oldham (Lancashire) as a Conservative. But he had returned from South Africa sympathetic to the Boer cause, and his army experiences had made him extremely critical of its command and administration, which he proceeded to attack all along the line. The tariff proposals of Joseph Chamberlain completed his alienation from the Conservative party, and in 1904 Churchill left the party to join the Liberals. In consequence he was for years execrated by the Conservatives, and was unpopular with army authorities.

As Liberal M.P. for Northwest Manchester (1906-1908) and for Dundee (1908-1918), he was in a position to share in the long Liberal run of power and to take his place in one of the ablest British governments in modern times. As undersecretary of state for the colonies he played a considerable part in making a generous peace with the Boers. In 1906 he published his authoritative biography, *Lord Randolph Churchill* (2 vols.), and in 1908, *My African Journey*, a first-class example of his lifelong flair for journalism. In this year, 1908, he married and, in his own words, "lived happily ever afterwards." By his marriage to Clementine Hozier there were one son (Randolph) and four daughters (Diana, Sarah, Mary, and one who died in infancy).

As president of the board of trade (1908-1910) and home secretary (1910-1911), he contributed largely to the early legislation of the welfare state. He helped to create labor exchanges, to introduce health and unemployment insurance, to prescribe minimum wages in certain industries, and to limit working hours. As first lord of the admiralty (1911-1915), he was in a key position, as German naval power rose to its peak and modernization of the British fleet became an urgent necessity. Churchill's collaboration with Admiral Lord Fisher to this end was historic: it produced the changeover to oil-fueled ships from coalburning vessels, the creation of a naval air service, and the first development of the tank. With war approaching, Churchill, on his own responsibility, kept the fleet fully mobilized.

With the German onrush through neutral Belgium in 1914, he led a naval detachment to Antwerp, but failed to stem the tide. In 1915 he made himself responsible for the campaign to force the Dardanelles, with the aim of pushing Turkey out of the war, of linking up with Russia, and of taking the Central Powers in the rear. The campaign foundered, partly through bad luck, partly through lack of experience in combined operations. Churchill was made to take the responsibility, and when a coalition government was formed in May 1915, the Conservatives made it a condition that he should be dropped as first lord of the admiralty.

Changing Political Fortunes: 1916-1939. The Dardanelles failure seemed the end of his political career. He took up painting as a hobby and a consolation, and he remained devoted to it for the rest of his life. His accomplishment in the art should not be underestimated. In 1916 he went back to the army, gallantly volunteering for active service on the western front, where he commanded the 6th Royal Scots Fusiliers. But his energy and ability could not be dispensed with, and Prime Minister Lloyd George called him back to become minister of munitions.

At the end of the war, Churchill became secretary of state for war and also for air (1919–1921). In this post he pushed through army reforms and the development of air power, and became a pilot himself. He involved himself in much controversy by backing the efforts of the counterrevolutionaries against the Bolsheviks in Russia. As secretary of state for air and colonies (1921–1922), he took a leading part in establishing the new Arab states in the Middle East, while supporting a Jewish national home in Palestine as an act of historic and humanitarian justice. He was also closely concerned in the negotiations to establish the Irish Free State, and thus earned further Conservative distrust.

Having lost his seat in Parliament in the 1922 elections, Churchill lived in the political wilderness for the next two years. He was able to go forward with his memoirs, *The World Crisis* (5 vols., 1923–29), a large canvas. After various attempts to form a central, antisocialist grouping, he went back to the Conservative party in time to become chancellor of the exchequer in Prime Minister Stanley Baldwin's government (1924–1929). He was least happy in this office and ill at ease with economic affairs. Churchill was responsible for returning Britain to the gold standard, with the pound sterling set at \$4.88 parity. This step was in conformity with the best expert advice, though Churchill's instinct was against it, and the policy was disastrous. It led to the coal strike, which precipitated the general strike in 1926. The general strike left a legacy of ill will and justified resentment throughout the labor movement, in particular a distrust of Churchill. It helped to bring about widespread unemployment, and was a factor in creating the world economic crisis that undid the recovery from World War I, promoted Hitler's rise to power in Germany, and brought about World War II.

During the whole of this disastrous period of 1929–1939, Churchill was out of office. During these years of political frustration he wrote his major works: *Marlborough* (4 vols., 1933–38); the first draft of *A History of the English-Speaking Peoples* (4 vols., 1956–58); a vivid and characteristic autobiography, *My Early Life* (1930); a revealing and suggestive book, *Thoughts and Adventures* (1932); and a volume of brilliant, if generous, portrait sketches,

Great Contemporaries (1937). He also began to collect his speeches and newspaper articles warning the country of the wrath to come.

No one would take heed of his reiterated warnings of the folly of attempting to appease Hitler and of the necessity to bring together a "Grand Alliance" against the aggressor powers before it was too late. Baldwin and Chamberlain were too solidly entrenched in power to shift. Churchill tried to rally the right-wing Conservatives against Baldwin's liberal Indian policy, and he backed Edward VIII against Baldwin at the time of the king's abdication in 1936. These weapons broke in his hands, and only lost him support. Appeasement of Hitler went on to the bitter end.

When war came in 1939, Churchill was inevitably recalled, as first lord of the admiralty. The signal went round the fleet, "Winston is back," a quarter of a century after his first going to the post. But the first wave of German military power overwhelmed Poland in September, and in the spring of 1940 the tidal wave overwhelmed northwestern Europe, followed shortly afterward by the fall of France.

War Leader: 1940–1945. On May 10, 1940, in the midst of this cataract of disasters, Churchill was called to supreme power and responsibility by a spontaneous revolt of the best elements in all parties. He, almost alone of the nation's political leaders, had had no part in the disaster of the 1930's, and he really was chosen by the will of the nation. For the next five years, 1940–1945—perhaps the most heroic period in Britain's history—he held supreme command, as prime minister and minister of defense, in the nation's war effort. At this point his life and career became one with Britain's story and its survival.

At first, until 1941, Britain fought on alone. Churchill's task was to inspire resistance at all costs, to organize the defense of the island, and to make it the bastion for an eventual return to the continent of Europe, whose liberation from Nazi tyranny he never doubted. He breathed a new spirit into the government and a new resolve into the nation. Upon becoming prime minister he told the Commons: "I have nothing to offer but blood, toil, tears, and sweat . . . You ask, what is our policy? I will say: It is to wage war, by sea, land, and air, with all our

As British wartime prime minister, Churchill attended a summit conference at Yalta, USSR, in February 1945, to discuss Allied war strategy and postwar planning with U.S. President Franklin D. Roosevelt and Soviet Premier Joseph Stalin.

might You ask, what is our aim? I can answer in one word: Victory."

Meanwhile he made himself the spokesman for these purposes among all free peoples, as he made Britain a home for all the faithful remnants of the continental governments. These included the Free French, for Churchill had himself picked out Charles de Gaulle as "the man of destiny." But Churchill's personal relationship with President Franklin D. Roosevelt was Britain's lifeline. Britain had lost most of her army equipment in the fall of France and during the evacuation of the British Expeditionary Force from Dunkirk in June. Roosevelt rushed across the Atlantic a supply of weapons that made a beginning.

By the autumn of 1940, Churchill was convinced that Germany could not bring off the invasion of Britain. Secure in this conviction, he took the momentous decision to send one of the only two armored divisions left in Britain to Egypt, to hold the land bridge to the East. Submarine warfare had placed a severe strain on the British navy, and Roosevelt again came to Britain's aid with the lease of 50 destroyers. Churchill took the grievous decision to cripple the French fleet at Oran, Algeria. He could not take the risk of the French navy's being taken over by the Germans, for this probably would have been the end for Britain.

The turning point of the war came in 1941, when Churchill took advantage of his opponents' mistakes. Hitler's invasion of Russia brought Russia into the war, and Churchill seized the opportunity of welcoming a powerful ally with both hands. Japan's attack on Pearl Harbor brought the United States into the war, and Hitler made the mistake of declaring war on the United States. Churchill's unforgettable speech to Congress after Pearl Harbor expressed something of the inspiration and high resolve in the face of mortal danger that he had given his countrymen while they had fought on alone for over a year.

The "Grand Alliance" to combat aggression that he had had in mind from the 1930's was now a fact. Churchill made himself the linchpin, journeying uncomplaining between Roosevelt and Stalin, though an older man than either. It was possible now to plan the liberation of the world from the aggressors. He and Roosevelt set forth their war aims in the Atlantic Charter, signed aboard ship off Newfoundland in August 1941.

The first fruits of Allied cooperation were the landings in North Africa, the rounding up of the Nazi forces there, and the invasion of Sicily and Italy, "the soft under-belly of the Axis." It proved harder going than was expected, supporting Churchill's opposition to the opening of a second front in the west. Not until the summer of 1944 were the preparations complete for the invasion of Normandy, to break open Hitler's Europe. Churchill had always had an acute personal interest in combined operations, and he regarded the mobile "Mulberry" harbors as in large part his own idea. Only the personal order of King George VI prevented the prime minister from landing with the landing forces on D-day.

The last year of the war saw the famous partnership between Churchill and Roosevelt dissolving. Churchill looked to the shape of things that would emerge after the war, with the immense accession of strength to Russia and to communism in Europe. At the summit conferences in Teheran and Yalta, Churchill was grieved to find

the president not supporting him in his struggle with Stalin to contain Russian expansion after the war. On the surrender of Germany in May 1945, Churchill rode around London in the victory celebrations, but, as he wrote, there was foreboding in his heart.

Peacetime Leader: 1945-1955. Before the surrender of Japan, Churchill's wartime government broke up, and the Labour party won a large majority in the general election of July 1945. Churchill was deeply affected by this blow, though it was in no sense a vote of censure upon him but upon 20 years of Conservative rule. He continued to enjoy the esteem of his countrymen while remaining leader of the opposition Conservative party.

He turned to writing a personal history, *The Second World War* (6 vols., 1948-1953), and to painting, exhibiting regularly at the Royal Academy. Though he was out of office, his prestige was a major asset to his country. In his famous "iron curtain" speech at Westminster College in Fulton, Mo., he warned the West against Russia's aims and the aggrandizement of communism, making a plea for cooperation between the English-speaking peoples as the only hope of checking it. This aroused a storm of controversy in the United States, but events soon confirmed Churchill's view of the world picture.

On Oct 26, 1951, at the age of 77, he again became prime minister, as well as minister of defense. As the Conservatives held a very small majority and Britain faced very difficult economic circumstances, only the old man's will-power enabled his government to survive. He held on to see the young Queen Elizabeth II crowned at Westminster in June 1953, himself attending as a Knight of the Garter, an honor he had received a few weeks earlier. In 1953, also, he received the Nobel Prize in literature. On April 5, 1955, in his 80th year, he resigned as prime minister, but he continued to sit in Commons until July 1964.

Last Years. Churchill's later years were relatively tranquil. In 1958 the Royal Academy devoted its galleries to a retrospective one-man show of his work. On April 9, 1963, he received, by special act of the U.S. Congress, the unprecedented honor of being made an honorary American citizen. When he died in London on Jan. 24, 1965, at the age of 90, he was acclaimed as a citizen of the world, and on January 30 he was given the funeral of a hero. He was buried at Bladon, in the little churchyard near Blenheim Palace, his birthplace.

CITY PLANNING

Municipal planning officials devoted most of their attention in 1965 to the improvement of downtown areas in their respective cities. By the end of 1965, many American cities had initiated, completed, or were actively engaged in redeveloping central districts that long ago had fallen into woeful neglect. Until recently, urban construction was focused primarily on housing developments in slum areas of the city and in open areas near its perimeter. In the early 1960's, private developers and city planners began to shift their emphasis from residential to commercial and administrative structures, and from the perimeter of the city to its dilapidated center.

Urban Renewal. By 1965, major urban renewal projects were in full swing in many large cities throughout the United States. In Cleveland, Ohio, roughly \$250 million and 194 acres of land were committed to downtown construction, dominated by the gleaming façade of the huge Erieview Plaza building. Philadelphia devoted itself to the completion of its \$120 million Penn Center near City Hall—an immense complex of office buildings, bus terminals, hotels, and underground concourses. In Boston, within easy walking distance of the historic Common, six large redevelopment projects were in various stages of construction. Baltimore placed the finishing touches on its highly modernistic civic center, and St. Louis completed the Gateway Arch

designed by Eero Saarinen (See SAINT LOUIS). In the midst of a bitter controversy over a plan to build a Lower Manhattan expressway, New York City continued to add to the massive array of glass and metal office buildings that dominate Park Avenue in midtown and parts of the financial district.

An increasing number of urban dwellers, however, were seriously questioning the attractiveness of the renewal projects, and asking whether the projects enhanced or diminished man in relation to the American city. Many of the renewal structures were criticized as architecturally uninspired glass monuments, monotonously rectangular in form and overwhelming in height. Many of the redevelopment projects and structures impart a sense of crushing oppression to cities that have already reached gigantic proportions and sprawl over scores of square miles. Many critics found newly constructed government buildings in Boston's Scollay Square a tasteless backdrop to the colorful State House, and regarded the glass canyons leading through Penn Center to Philadelphia's City Hall as an incongruous vista in a city famed for its Georgian structures. It has been argued that urban sprawl has two dimensions: it reaches far over the face of the land and looms upward into the sky. Many feel that the American city is becoming too large for the average citizen to grasp and too overwhelming to arouse his civic interest.

Urban Transportation. The growth of American cities, both upward and outward, has created a need for new or improved transportation to business centers. For nearly 20 years the automobile nibbled

away at the dominance of rail transportation, until the major streets in most cities were strangled by vehicular traffic. In many parts of large cities, automobiles, trucks, and buses became the principal sources of air pollution and noise. (See POLLUTION.) With the increase in traffic congestion, a number of American cities awakened to the need for new or improved systems of rail transportation within the community and between cities.

San Francisco took the most ambitious and far-reaching step in this direction. Known as the Bay Area Rapid Transit System District (BART), San Francisco's new rail system will consist of 75 miles of underground, surface, and elevated track, reaching from the center of the city into the two counties that house most of the city's commuters. BART will be fully operating by 1969. Its air-conditioned trains, moving at an average speed of 50 miles per hour, will be controlled by scheduling devices that will provide trains every two or three minutes at rush hours.

Although BART will represent the most advanced form of commuter transportation in an American city, San Francisco is not the only community to adopt a rapid transit system. In September 1965, President Johnson signed an authorization for constructing a long-overdue subway system in Washington, D.C. The new system, consisting initially of 25 miles of track, will eventually be expanded to 83 miles, extending from the center of the capital into its Maryland and Virginia suburbs. The subway is expected to begin operating in 1970.

As recently as November 1964, the voters of Atlanta, Ga., approved a constitutional amendment to build an extensive rapid transit system, and plans were under way in 1965 to construct 65 miles of track. Many cities with established rapid transit systems are planning to improve or extend existing facilities, but their plans, in most cases, fall far short of a real solution to their mounting transportation problems.

In Los Angeles, plans for a rapid transit system similar to BART were quashed by the state legislature with the explanation that the system was to be financed by a special tax on motorists. Ironically, motor vehicles produce most of the acrid smog that afflicts the city during summer months.

A great deal of attention during 1965 was devoted to novel forms of high-speed, intercity transportation. Inspired partly by Japan's "two-mile-per-minute" rail service between Tokyo and Osaka, the U.S. Congress passed legislation to investigate the feasibility of a high-speed transit system between Boston, New York City, and Washington, D.C. As a result of this legislation, it is hoped that ultimately new ways will be found to reduce rail travel time between northeastern coastal cities to a fraction of the time now required.

Urban Government. Developments in transportation have a profound effect on developments in urban government. Theoretically, the historical ideal of American government is federalism, a political system based on decentralized communities. In practice, federalism has been yielding steadily to centralized government—regional, state, or national—and the average citizen often feels that he has surrendered his sovereignty in public affairs to the professional specialist.

The trend toward centralization and professionalism is especially clear in municipal government. Many cities, because they are extensive urban complexes, cross several county and state lines, conflict-

ing with traditional village and town jurisdictions inherited from a decentralized community culture. The New York metropolitan area, for example, encompasses more than 1,000 separate governments, and the Chicago area, more than 900.

The problem of managing these separate jurisdictions as a single entity is giving rise to periodic governors' conferences, regional commissions, and interstate authorities. For example, the air pollution control board in Los Angeles County now deals with the pollution problems of a large complex of separate communities and is the prototype for a new form of regional government. The Port of New York Authority, although it is a unit of local government, involves the interests of two states, New York and New Jersey.

Increasingly, cities are vesting authority in professional city managers and city planners, few of whom are elected by the municipal constituency. More and more, architects, engineers, lawyers, and technicians are making vital municipal decisions that were once debated and formulated by the citizenry. The federal government participates in local urban affairs by providing funds for renewal projects, road-building programs, and water and air pollution control. A cabinet-level Department of Housing and Urban Development was established in August 1965, to help cities cope with their problems. On Jan. 18, 1966, Robert C. Weaver, former administrator of the Housing and Home Finance Agency, was sworn in as head of the department. The federal government can now be expected to wield even more influence in municipal affairs.

Short of decentralizing the large cities, there seems to be no solution to the diminishing authority of the individual citizen over his immediate urban area. There is some evidence of a trend toward decentralization, although it is overwhelmingly outweighed by the trend toward centralization. A national program for so-called new towns or satellite cities was proposed to Congress by President Johnson in May 1965; and in August 1965, Arthur T. Row, Jr., professor of city planning at Yale University, advanced a plan for building satellite cities in the New York metropolitan area.

The satellite city concept, which gained impetus from Britain's New Towns Act of 1946, envisions largely self-sustaining communities near big urban centers. Designed to prevent excessive congestion, the satellite cities hold some promise of providing the average city dweller with greater authority over the destiny of his community. Several satellite cities, privately financed, are now being planned or are under construction outside Los Angeles, Houston, and Washington, D.C. However, these projects represent only a minuscule countertendency to the formless urban belts and highly centralized regional governments that are emerging in the metropolitan areas of the United States. NEGRO AND WHITE CIVIL RIGHTS WORKERS marched from Selma to Montgomery, Ala., March 21-25.

CIVIL RIGHTS

Civil rights legislation in 1965 concentrated on making the civil rights of Negroes a reality. The most important single piece of civil rights legislation, the Voting Rights Act of 1965, provided not only for the suspension of "tests and devices" where they were administered to prevent Negroes from voting, but also, under certain circumstances, for the appointment of federal registrars. Legislation improving educational facilities and raising the standard of living in depressed areas is also expected to benefit the Negro's fight for equality.

The judiciary in general and the U.S. Supreme Court in particular have long been held to be the ultimate protectors of American civil liberties. In recent years, in addition to important legislation protecting civil rights—the Civil Rights Acts of 1957, 1960, and 1964—there have been historic decisions by the Supreme Court. In 1965 the court added to this list by holding that portions of the Civil Rights Act of 1964 are constitutional.

Although 1965 saw no civil rights demonstrations of the magnitude of the 1963 march on Washington, voter registration drives in the South and protests against *de facto* school segregation in the North continued. Violence erupted in Watts, the Negro section of Los Angeles, in August, and was not brought under control until hundreds of persons had been injured and several killed. Probably the most important demonstration of 1965 was the "freedom march" from Selma to Montgomery, Ala., in March.

VOTING RIGHTS ACT OF 1965

Like the right of free speech, the right to vote is a basic pillar of a democratic society. The Voting Rights Act of 1965, the culmination of countless attempts to guarantee the franchise to the Negro, was a "promissory note" that this constitutional guarantee would be made effective. It gave legislative meaning and sanction to the century-old 15th

Amendment to the U.S. Constitution, which had been enforced only through isolated decisions of the judiciary, particularly the U.S. Supreme Court. The Voting Rights Act cannot be considered solely from the legal point of view. It also must be measured in light of the marches and demonstrations, such as those that took place in 1965 in Selma, Ala., that gave impetus to its passage, and in its effect on traditional federal-state relations by emphasizing that the United States is one nation, not 50.

Background. The Voting Rights Act must be understood in historical perspective. Before the act, particularly in the deep South, the Negro was effectively barred from exerting his constitutionally guaranteed privileges. In 1964, Alabama's voting lists included 70% of the potential white electorate, but only 23% of possible Negro voters. Only recently has there been an increase in Georgia's Negro registration, to 44% of those eligible, compared with 75% of eligible whites. Mississippi, with a majority Negro population, counted only 29,000 Negroes among its 550,000 registered voters. Much the same picture was found in Louisiana and South Carolina, and even in some of the border states.

Discrimination was made effective in the South by the threat of force or by the application of economic sanctions against the Negro community. Furthermore, as administered, literacy tests, "understanding tests," or poll taxes allowed the white but not the Negro applicants to register and vote. These measures replaced the long-outlawed "grandfather clauses" (an individual could vote if his grandfather could vote) and the device excluding Negroes in Democratic primary elections, in a one-party system in which only whites could be members of the party. The Civil Rights Acts of 1957 and 1960 had been ineffective against discriminatory practices, since their provisions for inspection of voting records were insufficient to guarantee voting rights to all.

Provisions of the 1965 Act. The 1965 act provides for the suspension of "tests and devices" (such as

PIX

THE RIGHT TO VOTE was reinforced on August 6 when President Johnson signed the Voting Rights Act of 1965.

tests in which the applicant is required to read and explain extremely difficult parts of a state constitution) in cases where the U.S. attorney general determines that such tests or devices were in force on Nov. 1, 1964, and where less than 50% of the persons eligible to vote had been registered on that date or had voted in the presidential election of November 1964. By this provision, the act clearly was aimed at the centers of hard-core resistance.

Furthermore, the act provided that if state registrars and clerks refused to register Negroes, even with state regulations suspended, the U.S. attorney general was empowered to institute court proceedings by which federal examiners would be appointed to register the victims of discrimination, for both federal and state elections. Another provision benefited non-English-speaking persons, particularly Puerto Ricans, by banning English literacy tests and substituting the requirement of completion of the sixth grade in a school in American flag territory. A federal Court of Appeals decision upheld this section, and superseded a New York Supreme Court decision holding to the contrary.

Constitutionality. Most experts in constitutional law have given the green light to the Voting Rights Act. At issue is the reconciliation of the 15th Amendment with Article I of the Constitution, which gives the states the power to determine who shall vote, not only in state elections but also in federal elections. The 15th Amendment is largely negative in its phraseology, declaring that a state may not abridge the right to vote because of "race, color, or previous condition of servitude." But the unfamiliar second clause of this amendment gives Congress the power "to enforce this article by appropriate legislation." Until 1965, this clause was not used, and any enforcement of the right to vote had usually been in the hands of the judiciary. Although there had been some accomplishments, such as the outlawing of certain discriminatory state statutes, the administration of "tests and devices" prevented any real breakthrough in Negro voting registration.

The Voting Rights Act of 1965, approved by Con-

gress on August 4, would seem to be the kind of "appropriate" legislation referred to in the 15th Amendment. On Oct. 21, 1965, the Justice Department, in an unusual move, asked the Supreme Court to use its original jurisdiction to declare the act constitutional. This, in effect, would prevent obstruction of the new law by the voting laws of Alabama, Louisiana, Mississippi, and South Carolina, where state courts have ordered local officials not to enroll Negroes registered by federal examiners. Through September, federal examiners in the first three states had certified some 46,000 voters, but none had been placed on state lists. Relative to South Carolina, the law was to be tested in a case set for argument before the U.S. Supreme Court in January 1966.

Federal-State Relationship. Another important issue raised by the Voting Rights Act is the practical effect of direct federal action in what has long been regarded as a basic right of the states—the determination of who can vote. The states recognized this issue in the 1965 statute, because immediately after the act was signed into law by President Johnson in the presence of Roy Wilkins and other civil rights leaders on August 6, literacy tests as a prerequisite to voting were suspended in Alabama, Alaska, Georgia, Louisiana, Mississippi, South Carolina, and Virginia, in 26 counties of North Carolina, and in one county of Arizona. Suits were also filed in federal district courts to outlaw the poll tax in Alabama, Mississippi, Texas, and Virginia.

As of November 1, federal voting registrars had been sent into only 20 counties. This caused some ill-feeling between the Justice Department and civil rights leaders. The attorney general hoped that the suspension of "tests and devices" would force states to cooperate without the need of even greater federal interference, but civil rights groups wanted their own efforts reinforced by a quickened pace of federal intervention through voting registrars.

Civil Rights Demonstrations. The Voting Rights Act was directly connected with public civil rights demonstrations, such as those held in Selma, Ala., in 1965. It was in Selma that Rev. Martin Luther King, Jr., instituted the voter registration campaign that resulted in demonstrations and arrests in February, "Bloody Sunday" (March 7), and finally, the 54-mile "freedom march" from Selma to Montgomery on March 21–25, protected by the federalized Alabama National Guard.

SCHOOL SEGREGATION

Congress provided \$1.3 billion in aid for elementary and secondary schools in 1965. A problem connected with federal aid for schools is the very practical one of aid to segregated schools. There is a question as to the amount of pressure the federal government can use to accelerate the *de jure* desegregation required "with all deliberate speed" by the Supreme Court decisions of 1954 and 1955.

Desegregation and Federal Aid. Acting under Title VI of the Civil Rights Act of 1964, by which recipients of federal education aid must carry on activities without discrimination, U.S. Commissioner of Education Francis Keppel decreed on April 29, 1965, that aid would not be given to a public school system after the fall of 1967 unless all its grades were integrated. He also stated that a "substantial good faith start" must be made not later than the fall of 1965, with some degree of integration in four grades: the first grade of elementary school, the first grade of junior high school, and the

BLACK STAR

JAMES FARMER, former national director of the Congress of Racial Equality (CORE), is the grandson of a slave. He pioneered in the use of sit-ins and freedom rides in civil rights demonstrations. In April 1965 he led CORE's voter registration drive in Bogalusa, La. In June, Farmer was one of 225 persons arrested in Chicago demonstrations protesting the slow pace of school desegregation there. In July he was back in Bogalusa to resume the voter registration drive.

Farmer was born on Jan. 12, 1920, in Marshall, Texas. He studied for the Methodist ministry at Howard University (B.D., 1941), but refused to become a minister because the Methodist Church in the South was segregated. He organized the first chapter of CORE in Chicago in 1942, later became national chairman of the organization, and in 1961 was made national director. On December 25, Farmer resigned from CORE, effective March 1, 1966, to head a private agency in Washington, D.C.

PIX

ROY WILKINS, executive secretary of the National Association for the Advancement of Colored People (NAACP), has stressed the Negro's responsibilities as a citizen. On Jan. 4, 1965, he announced that the NAACP would begin a nationwide program of "citizenship clinics" for Negroes. With other civil rights leaders, Wilkins was present on August 6 when President Johnson signed the Voting Rights Act of 1965. When rioting broke out among Negroes in Los Angeles later in August, Wilkins called for a study of the causes, emphasizing that "the Negro community as well as the white community must assume adult responsibility. . . ."

Wilkins was born in St. Louis, Mo., on Aug. 30, 1901. He grew up in St. Paul, Minn., graduating from the University of Minnesota in 1923. He went to work as a newspaperman, and in 1934 became editor of *Crisis*, the official organ of the NAACP. He was appointed executive secretary of the NAACP in 1955.

PHOTO RESEARCHERS

MARTIN LUTHER KING, JR., led some 3,200 whites and Negroes on a "freedom march" from Selma to Montgomery, Ala., from March 21 to 25, 1965. From July 24 to 26, he led a campaign against *de facto* school segregation in Chicago, culminating in the largest civil rights demonstration in Chicago's history—a march to the City Hall by 10,000 to 20,000 demonstrators on July 26.

King was born in Atlanta, Ga., on Jan. 15, 1929. After graduating from Atlanta's Morehouse College in 1948, he attended Crozer Theological Seminary in Chester, Pa. (B.D., 1951), and earned his Ph.D. at Boston University in 1955. He became a national figure in 1955 when, as president of the Southern Christian Leadership Conference, he led a successful bus boycott by Negroes in Montgomery. In 1963 he was one of the leaders of the civil rights march on Washington, D.C. King was awarded the 1964 Nobel Peace Prize for his work on behalf of Negro civil rights.

first and last grades of high school. Keppel also insisted that steps must be taken toward faculty desegregation.

In an early report, the commissioner pointed out that pledges of compliance, or court orders, or voluntary desegregation plans, had been given by some 19,000 of the nation's 27,000 school districts. However, very few of these had come from Southern and border states. It is likely that financial pressure exerted by the federal government will be more effective than Supreme Court decisions in establishing school desegregation in the recalcitrant districts where *de jure* segregation exists.

De Facto Segregation. Events of the summer and fall of 1965 underscored the problem of *de facto* segregation. In June, James Farmer of CORE led a demonstration against *de facto* school segregation in Chicago. In July, at the White House Conference on Education, a special panel agreed that *de facto* segregation must go. However, the threat of withdrawing federal aid because of *de facto* segregation, as it exists in many Northern cities, is quite a different matter from the same threat against intentional discrimination.

Many political and educational leaders agreed that any federal attempt to achieve desegregation at the expense of the neighborhood school concept could produce an adverse effect on the entire civil rights movement. The 1965 mayoralty campaign in New York City had undertones of appealing to white sentiment for retaining the neighborhood school, and

CIVIL RIGHTS DEMONSTRATORS picket the White House in March, calling for federal intervention in Alabama.

UPI

PICTORIAL PARADE

FREEDOM MARCHERS gather on the Dallas County Court House steps in Selma, Ala., before march to Montgomery.

candidates for Boston's school board apparently campaigned with this appeal in mind.

In October, national attention was again focused on Chicago, where, because of "probable noncompliance" with the Civil Rights Act of 1964, Commissioner Keppel froze more than \$30 million in federal aid to the city's schools. Chicago's school superintendent, Benjamin C. Willis, retorted that "education is a state function and Congress did not give Mr. Keppel the power to alter this." After President Johnson's intervention, the funds were released.

The opposite official attitude toward *de facto* racial imbalance was indicated in New York State, where the Court of Appeals refused to review an action of the state commissioner of education which eliminated *de facto* segregation in the town of Hempstead, L.I. (See NEW YORK.) On the other hand, in a case argued before it (*Downs v. Board of Education*), the U.S. Supreme Court refused to review a lower court decision that upheld the redrawing of school district lines on a neighborhood and pupil-load basis, even though racial imbalance resulted. (See also EDUCATION.)

OTHER LEGISLATION

Much civil rights legislation was approved by the states in 1965. By September, the number of states with fair-housing laws had increased to 16. Several states passed laws in 1965 against discrimination in public accommodations, and almost three quarters of the states now have such statutes. Eight states passed fair employment practice laws, bringing the total to 32. Some of this progress resulted from the federal Civil Rights Act of 1964, which deferred federal action against states that have laws forbidding discrimination in employment and places of

public accommodation because of race or color.

The effectiveness of civil rights legislation varied with the type of discrimination. For example, the events in Selma and the passage of the 1965 Voting Rights Act proved that previous legislation in this area had not been sufficient. The provisions of the 1964 Civil Rights Act against discrimination in public accommodations, particularly in Southern urban centers, found widespread compliance. However, compliance with the sections on fair employment practices were not mandatory until July 1, 1965. Civil rights leaders pointed out that positive federal measures were required to enforce both the public accommodation and fair employment sections of the law.

PUBLIC DEMONSTRATIONS

In 1965, although civil rights groups led by Martin Luther King, Roy Wilkins, James Farmer, and other leaders continued to demonstrate, there was a falling off in the number of civil rights demonstrations and riots. Also, the "white backlash"—actions by persons and groups opposed to the Negro's attaining his civil rights—was less in evidence. Agitation for civil rights focused on a few events, particularly the Selma-to-Montgomery "freedom march" and the riots in the Watts section of Los Angeles. As expected, the trials of whites for alleged murders of participants in civil rights demonstrations ended in acquittals by Southern juries, giving added incentive to the extremists who advocate the use of force in the civil rights struggle.

Selma "Freedom March". Selma, Ala., was the primary location of Martin Luther King's campaign for voter registration. Without the dramatic impact of the Selma campaign, the Voting Rights Act of 1965 might not have become law. Selma, however, proved beyond question that the hard core of resistance to Negro voting would not be quashed by the more anemic statutes of 1957 and 1960. By early spring, after more than two months of marches and demonstrations, accompanied by arrests and the use of force by local police, only about 50 Negroes had been added to the voting lists in Selma.

Civil rights leaders, feeling that more dramatic measures had to be taken, planned a 50-mile march from Selma to the state capital at Montgomery. On March 7 ("Bloody Sunday"), state troopers broke up the march, injuring a number of participants. Eventually, however, a well-organized, peaceful march took place on March 21-25. Civil rights leaders were even more convinced that the deep South would not register Negroes unless the federal government itself intervened.

Watts Riots. The demonstration in the Watts section of Los Angeles was of a different order. It amounted to an explosive revolt in a Negro ghetto against poverty, lack of job opportunity, and alleged brutality and discriminatory tactics by the city police—the type of riot that law enforcement officials in all large U.S. cities had feared would take place in the summer of 1965. From August 11 to 14, the area was ablaze with hundreds of fires, and looting was rampant. More than 5,000 National Guardsmen were needed to restore order, and the rioting left at least 34 persons dead and over 1,000 injured. (See also LOS ANGELES.)

Murder Trials in the South. The first trial of Collie Leroy Wilkins, Jr., in Hayneville, Ala., for the murder of Mrs. Viola Liuzzo, a civil rights demonstrator who had participated in the Selma-to-Montgomery march, ended in a mistrial in May. In a retrial in

MOUNTED POSSEMEN and an Alabama state trooper wield canes and clubs as they charge into a group of civil rights demonstrators in Montgomery on March 16, five days before Martin Luther King led the Selma-Montgomery freedom march.

UPI

October, Wilkins was acquitted. At the end of September, also in Hayneville, an identical verdict was reached in the murder trial of Tom Coleman, who had been accused of killing a white theological student. But in December, an all-white jury in Anniston, Ala., found Hubert D. Strange, a white man, guilty of the July 15, 1965, slaying of Willie Brewster, a Negro. And in Hayneville, Collie Leroy Wilkins and two others were convicted of conspiracy to withhold the civil rights of Mrs. Liuzzo.

THE JUDICIARY

In the two decades since World War II, the U.S. Supreme Court has played an increasingly dominant role as the guarantor of the Bill of Rights, including its extension to the states through the 14th Amendment. In recent years, almost half of the cases heard by the Supreme Court have concerned civil liberties, and four out of five were decided in favor of the litigant. Although most of these decisions merely amplified earlier constitutional standards, a few struck out in new directions.

Racial Discrimination. A series of cases on racial discrimination was particularly related to the objectives of recent federal legislation. Two decisions in December 1964, *Heart of Atlanta Motel v. United States* and *Katzenbach v. McClung*, upheld Title II

of the 1964 Civil Rights Act, which prohibits discrimination in places of public accommodation. In 1965 a more unusual decision was rendered in the case of *Hamm v. Rock Hill*, when a bare majority of the court held that the convictions of sit-in demonstrators should be reversed because the 1964 Civil Rights Act prohibited prosecutions against those who actively objected to discrimination. In *Louisiana v. United States*, the court struck down a Louisiana "understanding" test as a prerequisite for voting.

Other Cases. In another civil liberties case (*Cox v. Louisiana*), the court reversed convictions for picketing and breach of peace, on the ground of invasion of freedom of speech; and in *Garrison v. Louisiana*, it reversed a criminal libel conviction by applying the tort standard announced in 1964 in N.Y. "*Times*" v. *Sullivan*. In *Zemel v. Rusk*, the court found no constitutional infraction in government restrictions on travel to Cuba.

At least 16 Supreme Court cases involved criminal procedure covering such subjects as illegal searches, self-incrimination, unbiased juries, waiver of jury trial, and, in *Estes v. Texas*, the effect of television on a fair trial. (See also LAW; UNITED STATES; and articles on the individual states.)

WIDE WORLD

CLEVELAND'S MAYORALTY ELECTION in 1965 was the closest the city has ever known. Ralph S. Locher (above) was reelected by fewer than 2,200 votes over Carl B. Stokes (left), Negro member of the state House of Representatives.

WIDE WORLD

CLEVELAND

Cleveland (1965 est. pop.: city, 810,865; metropolitan area, 2,070,000) had the closest mayoralty election in its modern history in 1965.

Elections. In a four-man race, with some 237,000 votes cast, Ralph S. Locher was reelected mayor by a margin of less than 2,200 votes over his leading opponent, Carl B. Stokes, a Negro member of the Ohio House of Representatives; both are Democrats. Locher took the oath of office for another two-year term on November 8, although Stokes sought to delay the ceremony until the results of a recount were known. Of the 33 councilmen who were elected, 31 were Democrats. Council President James V. Stanton retained his post.

One of the reasons for Mayor Locher's near defeat was his support of a 0.6% city income tax designed to raise an estimated \$18 million a year for the city's operating expenses. Voters defeated the tax measure in the May 4 primary election. The mayor also suffered from his refusal to confer with a civil rights delegation.

Industry. Industries in the Cleveland area boomed in 1965, with high rates of employment and a consequent shortage of skilled labor. In September the state Bureau of Unemployment Compensation reported that employment in the durable goods industries in the metropolitan area, which includes Cuyahoga, Lake, Geauga, and Medina counties, stood at 222,300, up 5% from the previous year. Total employment was estimated at 774,100, up 2.8%.

New Buildings and Improvements. Work continued on construction of the 32-story federal office building that is included in the downtown Erieview renewal project. Completion of the building is scheduled for September 1966. Ground was broken in the Erieview area in October 1965 for a new apartment building, the first to be constructed in the downtown area in many years.

Announcement was made of the sale of 70 acres or the 100-acre Standard Oil Company (Ohio) property, southeast of downtown Cleveland, where, in the 1860's, John D. Rockefeller and his associates started the oil-refining business that developed into the Standard Oil Company. The buyers reported that they plan to turn the acreage into a freight distribution center after the present refinery buildings have been razed.

Construction of a new campus for Cuyahoga Community College, a public two-year school opened in 1963, was cleared by passage of a county 0.6-cent tax levy expected to raise \$17.5 million in five years.

A \$4 million street improvement bond issue also was approved, but a \$6 million sewer bond issue was defeated.

Cleveland State University. The changeover of privately supported Fenn College, near downtown Cleveland, into Cleveland State University was completed in September 1965. Work began on plans for enlarging the campus area and adding buildings to accommodate thousands of additional students.

Other Events. Bishop Clarence G. Isenmann, formerly of Columbus, Ohio, was installed as coadjutor to Archbishop Edward F. Hoban and as apostolic administrator on Feb. 2, 1965. The Thompson Auto Album, an extensive collection of old automobiles and small airplanes, moved into a new \$1 million wing of the Western Reserve Historical Society on East Boulevard. The Cleveland Orchestra, conducted by George Szell, made a triumphant tour of Europe in the summer of 1965.

Public Finance. Cleveland's 1965 operating budget was set at \$61,091,994. The net funded debt, as of Jan. 1, 1965, amounted to \$144,853,000. The city tax rate was \$46.60 per \$1,000 of assessed real estate valuation.

CLOTHING

Apparel firms and allied industries continued in 1965 to make inroads into the ranks of big business. This development was achieved through diversification of products, mergers, acquisitions, and public stock issues.

Sales and Diversification. In 1965, more firms continued the trend toward multiproduct operations. Many dress companies manufactured accessories, and many men's firms added a women's line. Manufacturers having annual sales of over \$10 million gradually raised their share of both total industry volume and profits. These industry giants achieved this increase to some degree by surmounting the obstacles faced by one-man businesses—inadequate capital, outmoded machinery and equipment, complete dependence on the vagaries of fashion, and competition with better-known clothing manufacturers.

The dominant styles reflected the growth in suburban population and the trend toward casual living. The emphasis also reflected the coming-of-age of postwar children, with a resultant increase in the most clothes-conscious age group. Most large firms manufactured sports and other casual wear,

and junior-size and other youthful apparel, in styles neither entirely classic nor too daring, and at moderate prices.

However, small producers continued to dominate the industry in 1965. One fourth of the women's clothing and accessory producers in the United States had individual sales of less than \$250,000, and two thirds had sales of less than \$1 million.

Principal Markets. New York City led all principal U.S. markets in manufacturers' sales of women's and misses' unit-price dresses, coats, and suits; girls' and children's wear; and men's suits and coats. Other important centers were Los Angeles and Philadelphia (unit-price dresses); Chicago and Los Angeles (coats and suits); Philadelphia and Los Angeles (girls' wear); and Philadelphia and Chicago (men's suits and coats).

Columnist, "Women's Wear Daily"

COAL

World output of coal rose from 2.9 billion short tons in 1963 to an estimated 3.0 billion tons in 1964—a 3.8% increase—according to the U.S. Bureau of Mines. The USSR had the largest output, but about one fourth of its total was lignite, a lower-grade product. The United States had the largest output among non-Communist countries. (See MINING for coal output of major countries.)

United States. Domestic coal production of all grades totaled 504,182,203 short tons in 1964 (16.6% of the world total). This was an increase of 26,986,644 tons over 1963. The 1964 output rose for

both bituminous coal and lignite, but anthracite coal, mined only in Pennsylvania, dropped slightly.

At the start of the fourth week of October 1965, the year's output of bituminous coal and lignite to that date was about 404,887,000 net tons. This constituted a 3.5% increase over the 391,188,000 tons produced in the same period of 1964. Anthracite output by November 1965 was about 12,903,000 net tons, a 10.6% decrease from the 14,430,000 tons for the same period of 1964. The average price per net ton of bituminous and lignite coal increased from \$4.39 in 1963 to \$4.45 in 1964. Based on total production, including colliery fuel and dredge coal, the average value of Pennsylvania anthracite in 1964 was \$8.64 per short ton, a gain of 3% over the 1963 price of \$8.40.

The U.S. bituminous coal industry spent \$800 million in 1964 on improvements and supplies, including two new types of continuous automatic underground mining machine that considerably increase production rates, and a 140-cubic-yard shovel that strips surface earth and rock away from coal seams at a rate of 210 tons in 45 to 55 seconds.

Other Countries. Seventeen countries accounted for 95.3% of the world coal output in 1964. They were: USSR, 20.1%; United States, 16.6%; Communist China, 10.5%; East Germany, 9.4%; West Germany, 9.3%; Great Britain, 7.1%; Poland, 5%; Czechoslovakia, 3.8%; India, 2.3%; France, 2%; Japan, 1.9%; Australia, 1.7%; South Africa, 1.6%; and Hungary, Yugoslavia, Bulgaria, and Belgium, about 1% each. Coal production among countries in the European Economic Community was down almost 4% in the first 9 months of 1965, as compared with the same period of 1964.

International Activities, U.S. Bureau of Mines

COAST GUARD, U.S.

In the year 1965 the U.S. Coast Guard continued to advance toward its traditional peacetime goals of marine safety and law enforcement. Its long-range modernization program moved ahead in all sectors, ashore and afloat. Budget funds rose from about \$415 million in 1964 to over \$452 million in 1965. Military personnel numbered 31,671 in 1965. Authorized civilian personnel totaled 5,332.

The Coast Guard's law-enforcement activities involved boarding and examining the papers of 138,222 vessels and reporting 45,093 violations of the Motorboat Act. Other activities included issuing 519 permits to load or discharge explosives, covering 344,568 tons of explosives; and screening 7,658 waterfront workers for security.

Other services performed by the Coast Guard in 1965 included answering 38,586 calls for assistance, involving almost \$2 billion in cargo and property; towing 17,265 vessels 149,550 miles; rescuing 1,984 persons in peril; investigating 4,432 marine casualties; inspecting 5,343 vessels with a combined gross tonnage of 11,765,913; and reviewing plans for 40,641 vessels.

The Coast Guard maintained 41,778 navigation aids in the United States and elsewhere. The aids included 66 loran stations, 189 radio beacons, 7,193 day beacons, 11,084 lights (including lightships), 583 fog signals (except sound buoys), and 22,665 lighted, unlighted, and river-type buoys. Four ocean stations were maintained in the North Atlantic and two in the Pacific. These stations provided search

and rescue services, communication systems, air navigation facilities, and meteorological services along heavily traveled ocean routes. The Coast Guard continued its oceanographic work and aerial reconnaissance in operating the International Ice Patrol.

In 1965 the Coast Guard's surface fleet numbered 319 floating units, ranging from major cutters to small craft assigned to stations. Fixed and rotary-wing aircraft in operation in 1965 totaled 151.

The reserve strength of the Coast Guard was 3,122 officers and 26,367 enlisted personnel. The nonmilitary, voluntary Coast Guard Auxiliary was active in 826 flotillas throughout the United States. Its 23,000 members gave instruction to 137,395 persons, examined 183,002 motorboats, patrolled 2,875 regattas, and responded to 5,985 calls for assistance.

The automated Merchant Vessel Reporting System (AMVER), originally active in search and rescue work in the Atlantic Ocean, was extended to the Pacific Ocean area.

COFFEE

In the 1965-66 marketing year, world coffee production recovered sharply from the unusually small crop of 1964-65. The total of 78,234,000 bags (of 132.3 pounds each) was over 50% larger than the 51,727,000-bag total of the year before, and was the largest crop since 1960. About 63,358,000 bags were for export, up from the 37,121,000 bags of the previous year.

South America continued to be the world's largest continental coffee producer, with a total output in 1965-66 of 44,733,000 bags, or more than twice as

PRODUCTION OF GREEN COFFEE IN PRINCIPAL COUNTRIES (No. of bags of 132.3 lbs each)

Country	Average, 1955-56 to 1959-60	1964-65	Estimate, 1965-66
Brazil.....	28,300,000	10,000,000	34,000,000
Colombia.....	7,360,000	8,000,000	8,000,000
Ivory Coast.....	2,130,000	3,500,000	4,800,000
Angola.....	1,443,000	3,200,000	3,100,000
Uganda.....	1,508,000	2,600,000	2,800,000
Mexico.....	1,716,000	2,680,000	2,950,000
Indonesia.....	1,343,000	2,200,000	2,000,000
El Salvador.....	1,436,000	2,000,000	2,100,000
Guatemala.....	1,357,000	1,600,000	1,900,000
Ethiopia.....	1,100,000	1,550,000	1,570,000
World total.....	58,306,000	51,727,000	78,234,000

many as in 1964-65. About 35,362,000 bags were for export, or more than triple the 1964-65 level.

Africa, again the second-ranking continent, produced 17,894,000 bags, or 10% more than a year earlier. The North American crop, of 11,355,000 bags, was up 9% from 1964-65.

Most of the production increase in 1965-66 was in Brazil, the world's top producing country. Brazil's crop of 34,000,000 bags was more than triple its output of 10,000,000 bags in 1964-65, when heavy frost and drought decreased the crop.

Americans used an average of about 15 pounds of coffee per person in 1965, or 2% less than the consumption of 15.3 pounds in 1964, and 4% less than the 1957-59 average. Total coffee consumption in the United States was slightly less than the 22,374,000 bags consumed in 1964.

RAY REIMAN
President, Farm Business, Inc.

COIN COLLECTING

Shiny new silver coins appeared in pocket change for the last time in 1965, as Congress and President Johnson approved a law that virtually eliminated the scarce metal from U.S. coins. On the

brighter side, the coin shortage eased, and ground was broken for a new mint in Philadelphia.

New Coins. The supply of silver in the U.S. Treasury has been dwindling in recent years. As a result, Congress passed and the president signed, on July 23, the Coinage Act of 1965, which marked the first basic change in U.S. coinage since the nation's monetary system was established in 1792. The new law provided for a new dime and quarter, each with a copper core sandwiched between layers of cupronickel. The silver content of the new half dollar was reduced from 90% to 40%, with the rest copper. The design of the coins was not affected.

Quarters with the new composition were first struck on August 23 in Philadelphia, and were put into circulation on November 1. The new quarters were the only coins dated 1965 that were circulated during the 1965 calendar year. The 1964 dates had been retained on other coins released in 1965 in order to discourage hoarding. By the end of 1965, the coin shortage had been alleviated.

Production of the new dimes and half dollars began during 1965, but none was released until 1966, and all were to bear the date 1965 for the time being. Striking of cents and nickels dated 1965 also began just before the end of 1965. The "date lag" will be continued until the coin shortage ends. Production at the mint continued at a record pace in order to ensure that no coins dated 1964 or 1965 will become scarce. To further discourage hoarding, mint marks will be omitted from coins dated 1965 and thereafter.

The shortage of silver and of circulating coins resulted in other disappointments for the collector. The Philadelphia Mint did not strike any proof sets during 1965, and the sale of uncirculated coins by the mint was suspended until further notice. President Johnson had ordered 45 million silver dollars to be struck in 1965, but he rescinded the order because of the silver shortage.

New Philadelphia Mint. With coins in heavy demand, more steps were taken to increase production. On September 17, ground was broken for a new mint in Philadelphia that will accommodate revolutionary high-speed minting processes. The plant is scheduled to open in July 1967. The old San Francisco Mint (closed since 1955) was pressed into use on September 1 for the striking of cents, but they bore no mint mark.

Trends in Collecting. The Canadian Mint was swamped with 6 million orders for 1965 Canadian proof sets (six coins, 1 cent to \$1, face value \$1.91) bearing the new mature portrait of Queen Elizabeth II. On Jan. 2, 1965, the first day that orders were accepted, they were also cut off. More than 4 million orders were returned, triggering a speculative boom that boosted the price quotations per set from \$4 to \$18 within a month. As a result, the mint resumed production, using expanded facilities to fill all orders.

In recent years, speculation had resulted in steep advances in the prices of recent U.S. uncirculated and proof coins, most of which—paradoxically—existed in vast quantities. The collapse of the boom in 1965 caught speculators hoarding bags of coins. Values in some older U.S. series declined to a lesser degree. Many collectors welcomed the end of the speculative frenzy.

Foreign coins became more popular with U.S. collectors. Britain struck a crown honoring the late Sir Winston Churchill, the first commoner to appear on a British coin in more than 2,000 years. Other

NEW COINS issued in 1965 included South African currency made of bronze and nickel. Silver was omitted to head off a coin shortage. The springbok, South Africa's national symbol, appears on the rand. Other coins are the 50, 20, 10, 5, 2, and 1 cent pieces.

SOUTH AFRICA INFORMATION SERVICE

commemoratives included two coins by India honoring the late Prime Minister Jawaharlal Nehru, and coins from the Soviet Union and Czechoslovakia marking the 20th anniversary of the end of World War II.

The first Australian decimal coins were released early in 1966. South Africa omitted silver from its new coins. Other new releases came from many countries in 1965, with new African nations accounting for much of the increment.

Thefts. The theft of coins continued to plague private institutions, individual collectors, and coin dealers. On May 29, thieves stole 4,000 coins, including an extremely rare Brasher Doubloon, from the collection of Yale University. The university placed a value of more than \$980,000 on the coins. A Chicago coin dealer was later arrested in connection with the robbery, and indicted on a charge of interstate transportation of stolen property.

ANA Site Chosen. The American Numismatic Association in 1965 announced that its new home and headquarters would be built at Colorado Springs, Colo. Omaha, Nebr., the ANA's first choice, was abandoned when the available site proved to be too small.

COLLEGES AND UNIVERSITIES

A selected list of accredited junior colleges, senior colleges, and universities in the United States, Puerto Rico, the Canal Zone, Guam, and Canada appears on pages 184-197. This list includes schools of higher education which had an enrollment of 200 or more students during the 1963-64 academic year.

The information given for each school comprises the following data: its degree-granting status (if it is a senior college or a university); the composition of its student body; the legal controlling body of each institution; and the total enrollment of students of college grade as reported by the registrar for 1963-64.

All of the American institutions listed are officially recognized by the U.S. Office of Education in its *Education Directory*, Part 3, Higher Education. Canadian colleges and universities listed are accredited by the province in which they are located.

For a discussion of educational developments during 1965, see **EDUCATION**.

MAJOR COLLEGES AND UNIVERSITIES, U.S. AND CANADA

Note: Symbols and abbreviations that follow the name of each school listed are as follows: Level of Instruction—(1) 2-year junior college; (2) senior college granting bachelor's and/or first professional degree; (3) senior college granting master's and/or second professional degree; (4) college or university offering a doctoral program. Student Body—(M) men only; (W) women only; (Coed) coeducational; (Coed) separate colleges for men and women. Control—(Public) district, municipal, state, or federal; (Private) proprietary, corporate, or church. Enrollment—All students of college grade for the academic year 1963-64, excepting correspondence course students.

COLOMBIA

Political inaction during most of 1965 by a government preoccupied with elections scheduled for 1966 contributed to worsening economic conditions in Colombia. Kidnappings and terrorism added to the country's general unrest. Late in the year the government made a new effort to stimulate economic recovery and enlist outside financial support.

Political Deadlocks. The political stalemate hardened after December 1964, when the United States, the International Bank for Reconstruction and Development, and the International Monetary Fund denied further credits to Colombia until the government made drastic economic reforms. President Guillermo León Valencia, a Conservative, at first refused to devalue the peso for fear of increasing inflation. His own economic proposals were rejected by Congress, split among numerous factions of the Liberal and Conservative parties. Congressional members repeatedly demanded his resignation.

The cabinet likewise could not act because its members often disagreed with the president's policies. Gen. Alberto Ruiz Novoa, minister of war, was removed from office on January 27, because it was feared that his political activities might lead to a military coup. He later became a presidential candidate. Two successive ministers of finance resigned in disputes over economic policy. Finally, in August, 11 of the 13 cabinet members resigned, precipitating the third major reshuffle during Valencia's term of office.

Economic Problems. The economic crisis threatened to turn into a depression when the government curtailed imports in order to conserve dwindling currency reserves. This action cut off raw materials, forced some factories to shut down, and increased unemployment. Protesting shortages and price increases, the Union of Colombian Workers, a federation of 45 of the country's largest unions, threatened a general strike for January 25 and again for October 1. Appeals by the president averted these strikes, but labor protests continued.

COLOMBIAN STUDENTS riot in Bogotá, Colombia, in May, protesting U.S. intervention in the Dominican Republic.

Colombia's economic problem was partially alleviated in 1965 by favorable prices for coffee. The country had a trade deficit of \$38 million in 1964, but achieved a surplus of \$53 million in the first half of 1965. The domestic growth rate, which reached 6% in 1964, declined in 1965.

Economic Policies. On September 1, President Valencia put into effect by decree a new economic program. He authorized a partial devaluation of the peso and imposed new taxes and restrictions on non-essential imports. Consumer prices rose sharply following the devaluation, but the new policies enabled Colombia to qualify for renewed financial assistance. The United States Agency for International Development and three other international lending agencies gave assurances that if the new measures were maintained, Colombia would receive \$322 million in loan support during 1966.

Kidnappings. A series of kidnappings of wealthy Colombians terrorized Bogotá and rural areas in 1965 as extortionists used this means to raise funds, sometimes for political motives. Harold J. Eder, a prominent industrialist and landowner, was abducted and slain in March. During the first half of the year an estimated 400 persons were kidnapped.

COLOMBIA · Information Highlights

Area: 439,512 square miles.

Population: 15,434,090 (July 1964 est.).

Chief Cities (1964 est.): Bogotá, the capital, 1,487,920; Cali, 813,210; Medellín, 776,970; Barranquilla, 521,070.

Government: President—Guillermo León Valencia (took office 1962). Vice President—Dr. Carlos Lleras Restrepo. Congress—House of Representatives, 182 members; party seating (1965)—National Front (Liberal-Conservative coalition), 123; Liberal Revolutionary Movement (MRL), 29; National Popular Alliance, 30. Senate, 86 members; party seating (1965)—National Front, 74; MRL, 12.

Religious Faith: Roman Catholics, 97% of population.

Education: Literacy rate (1963)—58% of the population aged 7 and over. Total school enrollment (1962)—2,291,579 (primary, 1,948,772; secondary, 174,966; teacher-training, 41,928; technical, 95,497; higher, 30,416).

Finance (1965 est.): Revenues, \$278,000,000; expenditures, \$345,000,000; public debt (1963), \$471,000,000; monetary unit, peso (12.82 pesos=U.S.\$1, average rate, 1964).

Gross National Product (1963): \$3,268,000,000.

National Income (1963): \$2,776,000,000; average annual income per person, \$184.

Economic Indexes: Industrial production (1961), 121 (1958=100); agricultural production (1964), 121 (1956-57=100); cost of living (1964), 192 (1958=100).

Manufacturing (metric tons, 1963): Cement (1964, 1,965,000; gasoline, 1,287,000; coke, 380,000; sugar, 368,000; crude steel (1964), 195,600; wheat flour (1962), 190,000; natural gas, 101,000.

Crops (metric tons, 1964-65 crop year): Rice, 600,000 (ranks 20th among world producers); coffee, 475,000 (world rank, 2nd); cacao, 16,000 (world rank, 10th); potatoes (1962-63), 871,000; maize, 800,000; cassava (1962-63), 780,000; bananas (1962-63), 508,000; cottonseed, 140,000; sesame (1964-65), 55,000; tobacco (1964-65), 41,900.

Minerals (metric tons, 1964): Gold, 364,991 troy ounces (ranks 9th among world producers); crude petroleum (1963), 60,343,000 barrels (world rank, 17th); bituminous coal (1963), 3,200,000; iron ore, 710,000; salt, 340,000; gypsum, 110,000; silver (1963), 106,278 troy ounces.

Foreign Trade (1964): Exports, \$548,100,000 (chief exports: coffee, \$394,100,000; petroleum, \$75,000,000); imports, \$586,300,000 (chief imports, 1963: electrical machinery, \$42,893,000; motor vehicles, \$38,746,000; iron and steel, \$35,924,000). Chief trading partners (1963): U.S. (took 52% of exports, supplied 52% of imports); West Germany (took 12% of exports, supplied 10% of imports); Netherlands (took 7% of exports, supplied 2% of imports).

Transportation: Roads (1964), 23,988 miles (3,740 paved); motor vehicles (1964), 217,340 (automobiles, 108,588); railways (1963), 2,135 miles; merchant vessels (1964), 22 (106,000 gross registered tons); national airline, Avianca; principal airports—Barranquilla, Bogotá, Cali, Medellín.

Communications: Telephones (1964): 372,217; television stations (1964), 15; television sets (1964), 350,000; radios (1963), 4,000,000; newspapers (1962), 37 (daily circulation, 847,000).

Student Riots. A state of siege, or modified martial law, was imposed by the government on May 21, after rioting by 30,000 students in Medellín, Bogotá, Bucaramanga, and Barranquilla. The demonstrators protested intervention by the United States in the Dominican Republic. President Valencia utilized the stage of siege to carry out economic measures that Congress had refused to approve.

Forthcoming Elections. It was anticipated that the elections for Congress in March 1966 and for the presidency in August would test the Liberal-Conservative National Front coalition's ability to survive. Vice President Carlos Lleras Restrepo of the Official Liberal party withdrew as a candidate in May 1965, but was expected to return to the race.

JAMES H. STREET

COLORADO

One of the worst floods in Colorado's history left a trail of destruction in the South Platte River valley and elsewhere along the east face of the Rocky Mountains in June 1965. The floods, caused by heavy rainstorms that swept the foothill areas of central Colorado, began on June 16. When the water receded a week later, at least 13 persons had been killed and property damage was estimated at about \$102 million. In metropolitan Denver, areas

on either side of the South Platte were badly damaged, and 15 bridges were swept away. President Lyndon Johnson declared Colorado a major disaster area and made federal emergency aid available.

Tourism. The summer tourist business suffered a brief setback after the June floods but soon recovered. Rocky Mountain National Park, in its 50th year, had almost 2 million visitors.

The booming ski industry reported that skiers spent \$65 million in Colorado during the 1964-65 season. The 1965-66 season, bolstered by increased advertising and by expanding resorts, was expected to break all records.

Legislation. The General Assembly held its second-longest session in Colorado's history from January 6 to May 13. Despite political rivalry between the Democratic-controlled House and the Republican-controlled Senate, much legislation was passed. Highlighting the legislative session was the enactment of a fair-housing bill and a bill that affords state support for birth control education. A new apportionment law providing for the same distribution of seats in the General Assembly as now exists was also passed by both houses. A strong anti-billboard law was blocked, but a compromise version that had the approval of the outdoor-advertising industry was later adopted.

The legislature also made it a felony to evade food and lodging bills of over \$50; tightened the law regarding assaults on children; and allowed judges to set penalties in cases of first degree murder where a guilty plea is entered. Other bills made the office of state auditor appointive, and regulated the use of underground water.

Fiscal Measures. The legislature approved budget appropriations of \$250 million for the 1966 fiscal year—a rise of \$28.3 million over the 1965 budget. Of the total 1966 budget, \$188 million came from the general fund. The budget included \$71.1 million for primary and secondary education, \$3.5 million for junior colleges, and \$64.8 million for regular colleges and universities.

To raise additional revenues, the legislature increased the state sales tax from 2 to 3%, but allowed each resident a \$7 annual tax refund to compensate for taxes paid on food. The 3% sales tax was extended to beer, wine, and liquor, and the cigarette tax was raised from 3 to 5 cents a pack.

Highways. Colorado learned in 1965 that it would receive \$50,896,943 in federal funds under the U.S. Department of Commerce's expanded highway program. Of the total, about \$35,600,000 will be used for the construction of interstate highways.

Flood-damaged highways and bridges received legislative attention at a special session called by Governor Love in July. The legislature passed a special tax of 1 cent, to be added for 13 months to the regular motor fuel tax of 6 cents per gallon. The additional tax is expected to bring in about \$8,300,000, which will be matched by federal funds.

Nuclear Power Station Planned. The Public Service Company of Colorado announced plans to build a \$45 million nuclear power station that will supply 330,000 kilowatts of electricity. Several sites were under consideration for the plant, which is expected to be completed by 1971.

COLORADO · Information Highlights

Area: 104,247 square miles.

Population: 2,003,000 (1965 est.).

Chief Cities (1965 est.): Denver, the capital (520,000); Pueblo (98,000); Colorado Springs (82,000); Aurora (68,000); Lakewood (51,000); Boulder (50,000); Arvada (37,000); Englewood (35,800).

Government: Chief Officers—governor, John A. Love (R); Lt. gov., Robert L. Knous (D); secy. of state, Byron Anderson (R); atty. gen., Duke W. Dunbar (R); treas., Homer F. Bedford; comm. of education, Byron W. Hanford; chief justice, Edward E. Pringle. Legislature—General Assembly (convened Jan. 13, 1965): Senate, 35 members (20 Republicans, 15 Democrats); House of Representatives, 65 members (23 R, 42 D).

Education: School enrollment (1964-65)—public elementary, 314,000 pupils (10,896 teachers); public secondary, 198,000 pupils (9,440 teachers); nonpublic schools, 49,600 pupils (1,650 teachers); college and university (fall 1964), 64,809 students. Public school expenditures (1964-65)—\$212,000,000 (\$470 per pupil); average teacher's salary, \$6,025.

Public Finance (fiscal year 1964): Revenues, \$484,456,000 (including sales tax, \$60,724,000; motor fuel tax, \$43,939,000; federal funds, \$120,793,000). Expenditures, \$482,051,000 (including \$169,337,000 for education; \$95,353,000 for health, welfare, and safety; \$97,994,000 for highways).

Personal Income (1964): \$5,044,000,000; average annual income per person, \$2,566.

Public Assistance (fiscal year 1965): \$88,257,089 to 77,856 recipients (aged, \$60,325,786; dependent children, \$18,165,528).

Labor Force (employed persons, July 15, 1965): Agricultural, 62,400; nonagricultural (wage and salary earners), 701,000 (13% manufacturing, 20% trade, 20% government). Unemployed persons (July 15, 1965)—20,900.

Manufacturing (1963): Value added by manufacture, \$1,202,958,000 (food and food products, \$255,895,000; non-electrical machinery, \$66,978,000; fabricated metals, \$47,096,000; electrical machinery, \$43,068,000; primary metals, \$7,046,000).

Agriculture (1964): Cash farm income, \$711,492,000 (live-stock, \$462,915,000; crops, \$190,730,000; govt. payments, \$57,847,000). Chief crops (1963)—hay, 2,794,000 (ranks 17th among the states); sugar beets, 2,793,000 (rank, 3rd); alfalfa, 1,877,000 (rank, 16th); wheat, 829,920 (rank, 16th); potatoes, 472,900 (rank, 9th); barley, 256,944 (rank, 10th); apples, 40,800 (rank, 16th).

Mining (1964): Production value, \$316,011,000. Chief minerals (tons)—coal, 4,355,000 (ranks 11th among the states); uranium, 833,282 (rank, 3rd); zinc, 53,682 (rank, 4th); crude petroleum, 34,755,000 barrels (rank, 10th); silver, 2,626,000 troy ounces (rank, 5th); gold, 42,122 troy ounces (rank, 8th).

Transportation: Roads (1965), 79,814 miles (16,302 surfaced); motor vehicles (June 1965), 1,136,698; railroads (1963), 3,788 miles; civil aircraft (1964), 2,043 (163 airports).

Communications (1965): Telephones, 971,900; television stations, 13; radio stations, 83; newspapers, 26 (daily circulation, 855,077 in 1964).

COMMONWEALTH OF NATIONS

BRITISH SOLDIER on roof guards main street in Aden, on October 6, after rioting by persons seeking elimination of British power in the Arabian Peninsula state.

UPI

COMMONWEALTH OF NATIONS

Two countries, Gambia and Singapore, became independent members of the Commonwealth of Nations in 1965, but Rhodesia's unilateral declaration of independence left the former African colony politically and economically isolated from the Commonwealth.

Gambia won its independence on February 18. Singapore seceded from Malaysia on August 9, and was admitted to the Commonwealth as its 22nd sovereign member. (See GAMBIA; SINGAPORE.)

The Commonwealth of Nations is a voluntary association of sovereign states and their dependencies, linked by a common recognition of Queen Elizabeth II of Great Britain as its head and the symbol of the Commonwealth association. For a list of the Commonwealth members, see the accompanying table.

Commonwealth Relations. The Commonwealth heads of government met in London on June 17-25, 1965. A Commonwealth Secretariat and a Commonwealth Foundation to promote interchanges between Commonwealth organizations in professional fields were established. Arnold Smith, a Canadian, was named secretary-general of the Secretariat. The conferees discussed the situation in Rhodesia (see below) and the war in Vietnam. They agreed to form a four-man peace mission that would seek to open the door to negotiations on Vietnam, but the mission failed when the leaders of the Soviet Union, Communist China, and North Vietnam refused to meet with the group.

Delegates to the Commonwealth conference wel-

comed the establishment of the British Ministry of Overseas Development, as well as the British decision to provide interest-free loans where appropriate.

Delegates from the Commonwealth countries, plus Ireland and South Africa, attended a Commonwealth Standards Conference in London, in July. They discussed the implications of Britain's impending changeover to the metric system. The Commonwealth Economic Consultative Council met at Kingston, Jamaica, on September 22 and 23. Delegates discussed the growth rate of developing countries and their difficulties in obtaining development finance, and the possibilities of establishing stable and acceptable price levels for commodities important in Commonwealth trade. The first Commonwealth medical conference was held in Edinburgh in October.

In recent years, the influx of immigrants, particularly Negroes, from Commonwealth countries has caused some friction in Britain. Therefore, measures taken by Britain to control immigration and to ensure the integration of immigrants into the community were of considerable interest to the Commonwealth as a whole.

In the spring of 1965, Earl Mountbatten of Burma headed a fact-finding mission to eight Commonwealth countries. Lord Mountbatten made his report to the British government in June, and on August 2 the government issued a white paper on immigration. Under the new policy, Commonwealth immigration into Britain will be limited to 8,500 persons a year. A new National Committee for Commonwealth Immigrants was established to make grants

toward the salaries of full-time paid officials employed by local voluntary liaison committees helping immigrants adjust to their new environment. Prospective immigrants are now obliged to produce health certificates and to undergo health examinations at the port of entry. The government pledged a "determined attack on the housing shortage." On August 5, Parliament passed a Race Relations Act aimed at ending discrimination in public accommodations.

Rhodesia. Relations between Britain and Rhodesia became increasingly difficult during 1965 as the Rhodesian government, under Prime Minister Ian Smith, pursued a defiant policy that culminated in a unilateral declaration of independence on November 11.

The British government, under Prime Minister Harold Wilson, had refused to agree to Rhodesian independence on the basis of the existing constitution, which left political power in the hands of a white minority of 223,000 in a population of more than four million. Arthur Bottomley, secretary of state for Commonwealth relations, and Lord Gardiner, lord chancellor, visited Rhodesia from February 21 to March 3, 1965. They discussed the independence question with the Rhodesian government and with other representatives of Rhodesian opinion, including African nationalists, tribal chiefs, and white businessmen and farmers. Bottomley told the British Parliament on March 8 that progress seemed possible on the basis of discussions between the two prime ministers.

A white paper, issued by the Rhodesian government on April 26, questioned the efficacy of any economic sanctions that Great Britain or other countries might attempt to impose after a unilateral declaration of independence. But the white paper was criticized in Rhodesian economic circles and by Prime Minister Wilson, who warned in Commons, on April 29, that a "rebellion" would result in economic hardship for Rhodesia. Seeking a fresh mandate from his countrymen, Smith called a general election for May 7. His party, the Rhodesian Front, won 50 of the 65 seats in the Legislative Assembly.

A communiqué, issued at the conference of Commonwealth prime ministers in London in June, called for a conference between the British prime minister and all political leaders of Rhodesia "to seek agreement on the steps by which Rhodesia might proceed to independence within the Commonwealth at the earliest practicable date on a basis of majority rule."

Further talks took place in Rhodesia in July between the Rhodesian government and Cledwyn Hughes, British minister of state for Commonwealth relations, but neither side modified its position. Smith and D.W. Lardner-Burke, Rhodesian minister of law and order, met with Wilson and Bottomley in London in October. After the talks broke down, Wilson proposed that senior Commonwealth prime ministers visit Rhodesia to ascertain whether a peaceful solution could be found. This was rejected by Smith on October 18.

Wilson and Bottomley flew to Rhodesia on October 24 in a final effort to postpone independence. Wilson conferred with representatives of the Rhodesian government, and with spokesmen for all sections of Rhodesian opinion, including African nationalist leaders. He and Smith agreed on the appointment of a royal commission to determine whether the people of Rhodesia wanted independence under the present constitution. But after Wilson returned to London on October 30, events in Rhodesia moved swiftly toward a showdown. The Rhodesian government proclaimed

RHODESIA declared independence unilaterally on November 11, two weeks after fruitless talks between Prime Ministers Ian Smith of Rhodesia and Harold Wilson of Britain.

a three-month state of national emergency on November 5. On the next day, Smith charged that Wilson had hedged his acceptance of the royal commission to the extent that the idea had been scuttled. On November 10, Rhodesia pledged its "constant loyalty" to the British crown, no matter "whatever happens." The next day, Smith, on behalf of his government, declared Rhodesia independent.

Britain condemned the action, imposed economic sanctions, and airlifted oil to Rhodesia's landlocked neighbor, Zambia. But Prime Minister Wilson refused Zambia's request to send troops to protect the Kariba Dam, on the Rhodesian border, which supplies power for Zambia's copper industry. Angered at Britain's failure to subdue the Rhodesian regime, nine African nations, including Commonwealth members Ghana and Tanzania, cut diplomatic ties with Britain in December. (See also RHODESIA; UNITED NATIONS.)

Other Territories. In the African dependent territories, other than Rhodesia, progress toward independence was smooth. On March 1, Bechuanaland chose a Legislative Assembly under a new constitution providing for a ministerial form of government based on universal adult suffrage. The Bechuanaland Democratic Party (BDP) won 28 of the 31 seats in the assembly, and its leader, Seretse Khama, became the country's first prime minister. The BDP advocates a multiracial society. Khama told the assembly on December 13 that Bechuanaland would join the Commonwealth when it became independent as the Republic of Botswana on Sept. 30, 1966.

An election in Basutoland on April 29 resulted in victory for the Basutoland National Party, which won 31 of 60 seats in the National Assembly, and then formed a government under a "pre-independence" constitution that came into force on May 1. On July 7, Chief Leabua Jonathan was sworn in as prime minister. In the Swaziland legislature the announcement of constitutional review, leading to a new constitution, was made on August 19.

Participants in a Fiji constitutional conference, held in London from July 26 to August 9, recommended that Fiji should have an elected majority in the legislative council; that full adult suffrage, including the enfranchisement of minority groups, should be instituted; and that a ministerial system

¹Includes Northern Island, Channel Islands, and Isle of Man. ²Great Britain did not recognize Rhodesia's independence, declared on Nov. 11, 1965. Rhodesia thus technically retains its Commonwealth status as an internally self-governing colony. ³Mid-1963 est. ⁴Excludes dependencies, part of which became a separate colony, called British Antarctic Territory, on March 3, 1962. ⁵Not an integral part of the Commonwealth. ⁶1964 est. of India-held portion only.

should be set up. However, the Indian community in Fiji objected to a number of the detailed proposals toward these ends.

In South Arabia, progress toward independence, in accordance with a 1963 resolution by the United Nations General Assembly, was held up by local disagreements and trouble within Aden. (See ARABIA.)

As a result of a constitutional conference in London, September 7-24, Mauritius will become independent before the end of 1966, after a six-month preliminary period of full internal self-government. British Guiana will become independent on May 26, 1966, and will adopt its old name, Guyana. Racial turmoil subsided in 1965 under the leadership of Premier Forbes Burnham. (See BRITISH GUIANA.)

On April 5, the British government published a white paper rejecting recently asserted Spanish claims to Gibraltar. Frontier restrictions imposed by Spain in 1964 continued to impair Gibraltar's economy. Gibraltar's prime minister, Sir Joshua Hassan, was informed in London on July 21 that Britain would make grants of £1,100,000 and loans of £200,000 available over a three-year period.

On December 30, the Colonial Office proposed a new constitutional status, "states in association with Britain," for six Caribbean islands and island groups—Antigua, St. Kitts-Nevis-Anguilla, Dominica, St. Lucia, St. Vincent, and Grenada. The islands would be internally self-governing, but Britain would handle their foreign affairs and defense.

Recommendations for an overhaul of the constitution of the British Virgin Islands and the establishment of a partial ministerial system were contained in the report published August 12 by the constitutional commissioner, Dr. Mary Proudfoot.

In elections in British Honduras on March 1, the People's United Party, which advocates independence within the next few years, won 16 of 18 seats in the legislature. (See BRITISH HONDURAS.)

Aid to the Territories. Aid from Britain to the Commonwealth in 1964-65 was estimated at £127.1 million. Aid to the dependencies under the colonial welfare and development program from 1946 to March 31, 1965, totaled £295,992,303, of which £14,748,339 was disbursed in 1964-65. On Jan. 1, 1965, the Commonwealth Development Corporation was operating 121 projects at a total commitment of £125 million; new investment during 1964 totaled £12.1 million. Between 1953 and March 31, 1965, the Commonwealth Development Finance Corporation invested £30.8 million overseas, of which £2.2 million was put into 16 new projects in 10 countries in 1964-65.

Commonwealth External Trade. Exports from Commonwealth members totaled £11,746 million in 1964, an increase of 9% over 1963. Imports, at £13,362 million, rose 12%. In the first quarter of 1965, exports at £2,936 million were slightly lower than in the last quarter of 1964, but imports at £3,451 million showed a gain of £207 million.

Colombo Plan. The 15 members of the Colombo Plan for Cooperative Development in South and Southeast Asia received \$14,864 million from outside the area between 1950 and March 31, 1964. Of this, \$2,165 million was provided in 1963-1964.

COMMUNISM suffered a major setback in 1965 in Indonesia, where an abortive coup by Communists failed on October 1. Here, soldiers interrogate a suspected Communist.

COMMUNISM

The fall of Soviet Premier Nikita S. Khrushchev in October 1964 did not stop the disintegration of the world Communist movement. In 1965, Communist China continued to accuse the Soviet Union of betraying the Communist cause. The Chinese Communist press indicted the new Soviet leaders for cooperating with the United States, splitting world Communist unity, incorrectly revising Marxism, establishing a system of "phony" communism, adhering to a fraudulent treaty banning above-ground nuclear tests, and appeasing American aggression in Vietnam. The Chinese Communists also insisted that violent Communist revolution is preferable to peaceful coexistence between Communist and capitalist countries, and that a world war between them is inevitable. China also declared that Stalin was a great leader during a period of immense Soviet difficulties.

Soviet-Chinese Split. During the year, 10 Communist parties, mostly in the Far East, deserted Moscow's leadership in favor of Peking's. These parties were in Albania, Indonesia, Japan, Laos, Malaysia, New Zealand, North Korea, Thailand, and both North and South Vietnam. In addition, new Communist parties loyal to Peking were operating in 18 other nations—Australia, Belgium, Greece, the Netherlands, Portugal, Spain, Switzerland, and Yugoslavia in Europe; Brazil, Colombia, Guatemala, Mexico, Paraguay, and Peru in Latin America; and Burma, Ceylon, Lebanon, and India in Asia. To complicate matters, the Communist parties in Austria, Ecuador, Nepal, and Norway were split between pro-Moscow and pro-Peking groups.

In March, the Soviet Union convened a conference of Communist parties to plan a world Communist congress that would settle the Sino-Soviet dispute. This conference, as originally proposed by the former Soviet premier, Nikita S. Khrushchev, was to have taken place in late 1964 and to have included representatives of 26 countries. Khrushchev's successors, Premier Aleksei N. Kosygin and Communist First Secretary Leonid I. Brezhnev, postponed the meeting until March 1965. They were disappointed when delegates from the Communist parties in Albania, China, Indonesia, Japan, North Korea, North Vietnam, and Rumania refused to attend. Party leaders

COMMUNISM

came only from Australia; from Argentina, Brazil, and Cuba in Latin America; from Britain, Finland, France, Italy, and West Germany in western Europe; from India, Mongolia, and Syria in Asia; and from the Soviet eastern European satellites—Bulgaria, Czechoslovakia, East Germany, Hungary, and Poland. Delegates from the United States attended as observers. To avoid offending China, the conference change its title from "preparatory" to "consultative." The delegates failed to reach a decision on convening a world Communist congress.

Because the delegates of foreign Communist parties to the Moscow conference were unwilling to undertake any joint action against the Chinese Communists, the Soviet Union's position in the Sino-Soviet dispute was weakened. In reply to almost constant attacks by the Chinese Communist press against Soviet leaders and policy, Soviet spokesmen in 1965 merely stressed that the Chinese attitude imperiled world Communist unity. However, the Soviet government's actions were stronger than its words. In March, China was angered when Soviet police and soldiers broke up a Chinese-led riot of Asian students protesting before the U.S. embassy in Moscow against American involvement in Vietnam. Soviet police dispersed a similar demonstration by Vietnamese students in Leningrad in early April.

Communist China timed the explosion of its second nuclear test for May 14, 1965—the 10th anniversary of the conclusion of the Warsaw Pact. The USSR immediately published atomic air raid precautions in the press of Soviet Central Asia.

COMMUNIST ARMS CACHE in Caracas is guarded by Venezuelan soldier after seizure by government in November.

Despite militant gestures against each other, both China and the Soviet Union supplied arms to North Vietnam and to pro-Communist rebels fighting the established African government in the Congo (Léopoldville). Soviet weapons captured from the Congolese rebels proved to have been manufactured in 1964 expressly for guerrilla warfare.

The Sino-Soviet dispute created other difficulties. After a coup on June 19 had deposed the pro-Soviet Algerian government, the Soviet Union, despite Chinese objections, postponed the 1965 World Youth Festival until 1966, arguing that the original site in Algeria was no longer suitable. At the World Peace Congress in Helsinki, Finland, in July, both the Albanian and Chinese delegations accused the USSR of cooperating with the United States.

Eastern European Satellites. In 1965, the Communist parties of eastern Europe displayed increasingly independent tendencies. Official Czechoslovak propaganda praised the civil liberties and intellectual freedom of the Czechoslovak bourgeois republic of 1918-39. In March, a Polish Communist leader rejected the Soviet concept of a new Communist International dominated by one Communist country. In July, Rumania changed its designation from "people's republic" to "Soviet republic," and adopted a new constitution eliminating all references to the Soviet liberation of Rumania during World War II.

Even Bulgaria, the most pro-Soviet of all the USSR's European satellites, experienced nationalistic unrest during 1965. In April, five army officers and five prominent civilians led a small military revolt in an unsuccessful attempt to overthrow the Bulgarian government and establish a Communist regime independent of Moscow. The rebels, who included a foreign ministry official and a college dean, were apparently sympathetic to independent Communist Yugoslavia, not Communist China. The leaders were tried and given relatively moderate prison sentences ranging from three to 15 years.

Although the eastern European satellites showed increased independence, Soviet troops remained in three satellite nations; there were two divisions in Poland, four in Hungary, and 20 in East Germany. The USSR continued to refuse to allow its European satellite armies to have long-range rockets, heavy bombers, or nuclear weapons. The armies of the active Warsaw Pact nations—Bulgaria, Czechoslovakia,

East Germany, Hungary, Poland, Rumania, and the USSR—continued to be commanded by a Soviet assistant minister of defense. These nations held joint military maneuvers in the Carpathian Ukraine in May, and in the Thuringia region of East Germany in November.

Although the Communist bloc countries in 1965 produced about two fifths of world industrial output, Communist industry was inefficient, often producing machines and goods of poor quality. Except in increasingly independent Rumania, rates of industrial growth were slowing down in Russia and eastern Europe, the two main concentrations of Communist industry. Bad weather caused poor harvests in 1965 in both areas, and their governments instituted economic reforms to increase profits in industry and agriculture.

The Council for Economic Mutual Assistance (CEMA), whose active members are Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Rumania, Outer Mongolia, and the USSR, again failed to establish a Communist common market to aid Communist national economies. Soviet appeals for eastern European satellites to concentrate on specialized industries fell on deaf ears. Each satellite government preferred a well-rounded industrial economy that would be self-sufficient should the nation leave the Soviet orbit in the future. Most of the satellites felt that a specialized economy would create dangerous dependence on other CEMA countries for key products.

In 1965 the Soviet Union was troubled by the tendency of its eastern European satellites to increase trade with Western countries. The satellites also welcomed Western tourists who brought in foreign currency. Some of the eastern European nations permitted West German, British, and American firms to build and operate enterprises within their borders. Rumania purchased from West Germany machines that were also available in East Germany, and when East Germany protested, Rumania replied that the West German machinery was better. Meanwhile, eastern Europe, the USSR, and Communist China all continued to buy grain from some Western countries, notably Canada.

Communist economic troubles may be one reason for the apparent lack of faith of eastern Europeans in Marxism. A poll by Radio Free Europe of several thousand eastern Europeans traveling in western Europe revealed that of those interviewed only 14% of the Czechoslovaks, 13% of the Rumanians, 7% of the Hungarians, and a mere 6% of the Poles believed in the Communist system.

Asia. A grave setback for the Communist idea of forcible revolution occurred in Indonesia in late September and early October, when armed Communist civilians and pro-Communist air force units failed in a week-long attempt to seize power. Apparently instigated by Communist China, the revolt was crushed by the Indonesian army, which traditionally has been anti-Communist. Muslim mobs, without interference from the army, looted and burned buildings belonging to the Indonesian Communist party, the Communist youth league, and pro-Communist trade unions. Communist leaders either went into hiding or fled the country. Violence flared again in late October and November when Communist forces in the province of Central Java clashed with Indonesian army troops. An army directive established martial law in Central Java on October 28.

The abortive Communist revolt against Indonesia's

President Sukarno, Chinese border attacks upon India during and after the undeclared three-week Indian-Pakistani war, and Peking's refusal to mediate the Vietnamese war, all frightened many Asian and African governments which Red China had been wooing. In the fall of 1965, few official representatives from underdeveloped nations of the free world attended ceremonies in Peking honoring the founding of Communist China.

Latin America. A great change occurred in the revolutionary tactics of Latin-American Communists at the beginning of 1965. For decades Communists had tried to gain power by infiltrating national governments, or groups like national armies and trade unions that might have or might get political power. Recently both Communist China and Cuba have opposed such infiltration "from the top," and have started to organize Communist guerrilla bands among the impoverished Latin American peasantry. Fearful of alienating Cuba's Premier Fidel Castro, and jealous of Chinese Communist influence, the USSR convened a meeting of Latin American Communist leaders in Havana at the close of 1964. They were instructed to render all-out support to Communist guerrillas already fighting the legal governments in six nations—Colombia, Guatemala, Haiti, Honduras, Paraguay, and Venezuela. Latin American Communist leaders were also ordered to put pressure on their governments to resume diplomatic relations with Cuba, to end the economic blockade of Cuba, and not to take unfriendly actions against Cuban Premier Castro.

Meanwhile, there were indications that all was not well in Communist Cuba during 1965. In May, Ernesto ("Ché") Guevara, the former chief of Cuba's economic planning, disappeared from Cuban

U.S. COMMUNIST LEADER Gus Hall (above) hails U.S. Supreme Court decision of November 15 that Communist party members may refuse to register as agents of foreign power.

political life. His disappearance came after an official trip to Africa, Egypt, and Communist China, during which he antagonized the Soviet Union by stating that prosperous Communist nations should supply free material aid to underdeveloped Communist countries. It appeared that Guevara might have been purged from Cuban power at Moscow's insistence. Castro asserted that Guevara left Cuba to participate in a revolutionary struggle elsewhere in Latin America.

Shortages of food and housing evidently induced Castro to allow any Cuban who so desired to emigrate to the United States. This offer was accepted by the U.S. government, and the exodus of thousands of Cuban refugees began in October. Cuba thus became the first Communist country to permit large-scale emigration.

North America. The Communist party of the United States, with a membership of only 10,000, officially supported the USSR in the Sino-Soviet dispute, but publicly criticized the Soviet Union for anti-Semitism. During 1965 the party and its sympathizers were active in student meetings opposing U.S. intervention in the Vietnamese war.

On February 24, the U.S. Department of Justice secured the indictment of the Communist party by the U.S. district court in Washington, D.C., for failing to register with the department as required by the Internal Security Act. A separate indictment requested that the party list its members and financial activities. The U.S. Supreme Court ruled on November 15 that individual members of the Communist party may refuse to register with the U.S. Department of Justice. Forcing them to register as agents of a foreign power, the court declared, infringed on their constitutional guarantees against self-incrimination.

On October 6 the U.S. tax court in Washington, D.C., ruled that the Communist party is not a charitable or fraternal organization, and that it is therefore not tax exempt and must pay \$326,313 in federal income taxes and penalties for the year 1951. The party refused to pay and appealed the verdict to a higher court.

In January the Canadian Communist party elected William Kashtan as general secretary to replace Leslie Morris, who died on Nov. 13, 1964. The party supported the USSR in the Sino-Soviet dispute, but a tiny splinter group called the Progressive Workers Movement accepted the leadership of China.

CONGO, Democratic Republic of

As head of the transitional government of Congo (Léopoldville) set up in July 1964, Premier Moïse Tshombe had the responsibility of getting the country to operate under a new constitution. He also had to suppress the rebellion in the northeast, hold parliamentary elections, improve the economy, and make his government acceptable to other African states. He succeeded in these labors in 1965, but was denied the fruits of victory. In October he was dismissed by President Joseph Kasavubu, whose government was overthrown in a military coup led by Maj. Gen. Joseph Mobutu in November 1965.

Rebellion. Congolese rebels continued their struggle against the government even after the rebel capital of Stanleyville fell to government troops in November 1964. Despite the receipt of modern arms from Algeria and Egypt, along with Soviet aid, the rebels were defeated, but not before they had massacred hundreds of European hostages and trained Africans. Attacks on the rebels were spearheaded by white mercenaries recruited in Rhodesia, South Africa, and Europe. Efforts by the Organization of African Unity to effect a reconciliation between the rebels and the government failed.

In March 1965 the rebels lost control of their supply routes from the Sudan and Uganda. On April 29, Tshombe announced that the rebellion was over. Their leaders fled the country and went to Cairo, where they created a 20-member Supreme Council of the Revolution to replace the defeated Stanleyville government. Christophe Gbenye became prime minister and Gaston Soumialot president of the government-in-exile. Cooperation between the leaders was impossible, and the reorganized government was unable to operate effectively.

Tshombe's formal proclamation of victory did not mark the absolute end of the rebellion, however, and armed rebels still roamed the countryside in northeastern Congo late in 1965. If the country's economy and administration are to be maintained on a stable basis, these rebels must be subdued. To help achieve this aim, the government authorized European heads of plantations and mining companies to arm themselves against depredations by rebellious elements.

Economy. The country, particularly the northeastern section, suffered much from the rebellion, which interfered with production and transportation. However, copper production increased, as did the profits of the Union Minière du Haut Katanga, the

country's most important industrial federation. Congo's total exports also rose.

Tshombe's most notable economic achievement was a settlement with Belgium in February that arranged transfer to Congo of \$300,000,000 in securities held by the former Belgian colonial administration.

Elections. Under the 1964 constitution, a National Assembly election was scheduled for February 1965, but was postponed until March 18–April 30. Preparations for the election stirred considerable political activity, and in early February, Tshombe organized 49 of the country's 243 political parties into a loose grouping called the Congolese National Convention (CONACO). The elections gave CONACO a safe majority in both chambers of the National Assembly. However, because of reported irregularities, a special court ordered new elections in three districts where CONACO won 20 of 32 seats.

On the grave questions of whether he would resign and who would be the next president, Tshombe differed with President Joseph Kasavubu. It was Tshombe's view that his government could function until the election of a new president six months after the dissolution of the old parliament, or early in 1966. Tshombe believed that he needed only to enlarge his cabinet by relinquishing most of the nine ministries he himself held.

Although Tshombe made no formal declaration, it was generally believed that he would seek the presidency, an office that held vast political power under the new constitution. Since Kasavubu aspired to retain the presidential office, a serious but unacknowledged rivalry developed between the two men. Kasavubu, who had not been enthusiastic about Tshombe when he made him premier in 1964, was most reluctant to see him in control of the new government and gaining popularity at home and abroad. Kasavubu took the position that Tshombe's mandate would lapse when the results of the elections became known, presumably by June 30.

Finally, Kasavubu decided to act. On July 6 he dismissed Godefroid Munongo, Tshombe's minister of the interior. Instead of letting Tshombe add a tenth portfolio to the nine he already held, Kasavubu appointed Victor Nendaka, former head of the security police, to take over the Interior ministry. The president convoked the National Assembly in an extraordinary session on September 13, although, with election returns not in from all disputed districts, only 155 of the full complement of 166 deputies were present. Tshombe's CONACO supporters

Religious Faiths: Tribal religions, 50% of population; Roman Catholics, 31%; others, 19%.

Education: Literacy rate (1955)—15% of population aged 15 and over. Total school enrollment (1962–63)—1,834,614 (primary, 1,762,000; secondary, 71,000; higher, 1,614).

Finance (1964 est.): Revenues, \$208,000,000; expenditures, \$227,000,000; monetary unit, franc (180 francs equal U.S.\$1.)

National Income (1959): \$268,000,000; average annual income per person, \$19.

Economic Indexes: Industrial production (1959), 99 (1958=100); cost of living (1964), 368 (1961=100).

Crops (metric tons): Palm kernels (1963–64), 101,600 (ranks 3rd among world producers); coffee (1964–65), 48,000 (rank, 16th); tea (1964), 4,500 (rank, 17th).

Minerals (metric tons, 1964): Manganese ore, 309,348 (ranks 9th among world producers); copper, 277,641 (rank, 6th); zinc, 105,540 (rank, 10th); tin, 7,811 (rank, 8th); gem diamonds, 295,000 carats (rank, 7th).

Foreign Trade (1963): Exports, \$132,000,000 (chief export: copper, \$56,100,000); imports, \$110,000,000. Chief trading partners: Belgium-Luxembourg (took 20% of exports, supplied 28% of imports); U.S. (took 4% of exports, supplied 31% of imports).

Transportation: Roads (1964), 90,430 miles (930 paved); motor vehicles (1964), 53,000; railways (1958), 3,215 miles; airline, Air Congo; principal airport, Léopoldville.

Communications: Telephones (1964), 30,000; radios (1959), 35,000; newspapers (1962), 7 (daily circulation, 28,000).

Area: 905,562 square miles.
Population: 15,627,000 (July 1, 1965, est.).
Chief Cities (1964 est.): Léopoldville, the capital, 1,000,000; Elisabethville, 200,000; Stanleyville, 100,000.
Government: President—Gen. Joseph D. Mobutu (assumed office Nov. 25, 1965); Premier—Leonard Mulamba (appointed Nov. 28, 1965). Parliament—National Assembly (Chamber of Deputies, 166 members; Senate, 132 members).

elected their candidate president of the Chamber of Deputies, but had no similar success in the Senate.

In late September and early October, Nendaka formed a political party known as the Congolese Democratic Front to oppose Tshombe's CONACO.

Addressing the joint session of both chambers of the National Assembly on October 13, Kasavubu surprised everybody by dismissing Tshombe and naming Evariste Kimba as his successor. Kimba had served Tshombe as foreign minister in his secessionist government, but had opposed him in the recent elections. The move might be regarded as an attempt to check Tshombe's plans to reunify Katanga Province, which had seceded from the Congo in 1960. Violence broke out in Léopoldville, where mysterious attacks were made on Tshombe's supporters. Demonstrators at the Belgian embassy in Léopoldville charged that Belgian troops were supporting Tshombe.

Army Coup. On November 25, Maj. Gen. Joseph Mobutu, commander of the Congolese army, staged a quiet and bloodless coup to end the growing violence. He took over the office of president himself, cancelled the presidential elections scheduled for the spring of 1966, and announced that he would hold the office for the next five years. He named Col. Leonard Mulamba as premier, to head a government of "national union." Tshombe was not included in the new government. On December 1, Mobutu announced that he would rule the country by decree, although Parliament was given the formal right to veto his decrees. (See also AFRICA.)

CONGO, Republic of the

The government of the Congo (Brazzaville) consolidated its power in 1965 and became more radical in dealing with dissident elements within the country. In foreign affairs, Brazzaville's relations with neighboring Congo (Léopoldville) continued to be strained.

Party Purge. The purge of moderate labor leaders of the Confédération Africaine des Travailleurs Croyants from the ranks of the country's sole political party, the National Revolutionary Movement, was completed in 1965. All workers were organized into a single organization, the Confédération Syndicale Congolaise.

Officials Slain. Three Brazzaville government officials were murdered in February, after Premier Pascal Lissouba warned of a plot against the government involving the "financial backers of Moïse Tshombe," then premier of Congo (Léopoldville). Lissouba's warnings about the plot gained some credence when former President Fulbert Youlou, who had been overthrown in August 1963, fled Brazzaville and was granted asylum in Léopoldville. In

Minerals (metric tons, 1964): Gem diamonds, 316,000 carats (ranks 5th among world producers); zinc, 5,060; lead, 2,177; copper (1963), 290; crude petroleum, 619,000 barrels; gold, 3,567 tray ounces.
Foreign Trade (1964): Exports, \$47,400,000 (chief exports: diamonds, \$19,700,000; wood, \$19,300,000); imports, \$72,500,000 (chief imports, 1963: alcoholic beverages, \$3,100,000; woven cotton fabrics, \$3,000,000; trucks, \$2,200,000). Chief trading partners (1963): France (took 15% of exports, supplied 61% of imports); Belgium-Luxembourg (took 29% of exports, supplied 2% of imports); West Germany (took 17% of exports, supplied 7% of imports).
Transportation: Roads (1964), 6,737 miles (147 paved); motor vehicles (1964), 14,200 (automobiles, 7,400); railways (1963), 321 miles; principal airport, Brazzaville.
Communications: Telephones (1964): 7,186; television sets (1963), 100; newspapers (1959), 3 (daily circulation, 1,100).

June a people's tribunal in Brazzaville sentenced Youlou to death *in absentia*. From Léopoldville, Youlou continued to press for the overthrow of the Brazzaville government.

Foreign Affairs. The most important consideration in Brazzaville's foreign policy during 1965 was the hostility between Brazzaville and Léopoldville. Throughout most of the year each government accused the other of aiding attempts to subvert it.

Brazzaville's relations with the United States were strained in 1965. The major point of friction seemed to be the U.S. backing of the Tshombe government in Léopoldville. On August 13 the United States withdrew diplomatic and consular representation in Brazzaville after protesting their alleged mistreatment by the Congolese government.

In 1965 the Congo continued to maintain friendly relations with France, which is the country's chief supplier of goods and aid.

Communist China increased its influence in Brazzaville in 1965, but the government of President Massamba-Débat also maintained friendly relations with the Soviet Union and France.

CONGRESS

The United States Congress consists of the Senate (100 members) and the House of Representatives (435 members). Senators are elected for six-year terms; with each third elected at two-year intervals. Representatives serve two-year terms.

The first session of the 89th Congress (Jan. 4-Oct. 23, 1965) had 68 Democratic and 32 Republican Senators and 295 Democratic and 140 Republican Representatives. The second session opened on Jan. 10, 1966. A list of members appears on pages 208-209. (For 1965 congressional actions see UNITED STATES.)

EIGHTY-NINTH CONGRESS OF THE UNITED STATES

WIDE WORLD

URBAN RENEWAL IN CONNECTICUT CITIES
is creating many new urban centers, as in Hartford.

CONNECTICUT

Major events of 1965 in Connecticut were the adoption of a new constitution replacing the one in effect since 1818, and the reapportionment of the General Assembly.

New Constitution. A constitutional convention of 42 Democrats and 42 Republicans met from July 1 to October 28, and adopted a new constitution for the state. Voters approved the document on December 14 by a vote of 178,426 to 84,219.

The new constitution provides for a House of Representatives of 125 to 225 members, and a Senate of 30 to 50 members, with mandatory reapportionment every 10 years. Other provisions require a two-thirds vote, instead of a simple majority, to override the governor's veto; strengthen home rule powers for towns; speed up the process for amending the constitution; and provide for future constitutional conventions. Antidiscrimination sections were added to the state Bill of Rights. A controversial provision on eminent domain, giving greater protection to private property, was presented as a separate proposal, but it was defeated at the polls.

Reapportionment. The Assembly, originally elected in 1962, remained in office because of its failure to adopt a reapportionment plan in time for scheduled 1964 elections. The Assembly began a special reapportionment session in November 1964, and on Jan. 18, 1965, adopted a plan accepted as constitutional by the special federal court. The reapportionment bill provides for redrawing the 36 state Senate district lines, and reduces the membership of the House from 294 to 177, to be elected from newly drawn districts. The court then authorized the Assembly to convene on February 2 as the legal legislature for 1965. A new Assembly will be elected in November 1966.

Other Legislation. On budgetary matters the Democratic governor, John Dempsey, and the Senate were in conflict with the Republican House. They eventually accepted a \$510,000,000 six-year road program sponsored by the Republicans, but succeeded in postponing a gasoline tax increase.

The Assembly adopted a court reorganization act which provides for more judges, year-round sessions, better salaries, and a new administrator for the entire system.

Area: 5,009 square miles.

Population: 2,752,000 (1965 est.).

Chief Cities (1965 est.): Hartford, the capital (158,000); Bridgeport (156,000); New Haven (151,000); Waterbury (106,000); Stamford (100,500); New Britain (85,500); Norwalk (75,000); West Hartford (67,500).

Government: Chief Officers—governor, John Dempsey (Democrat); lt. gov., Samuel J. Tedesco (D); secy. of state, Ella T. Grasso (D); atty. gen., Harold M. Mulvey (D); treas., Gerald A. Lamb (D); comm. of educ., William J. Sanders; chief justice, John Hamilton King. **Legislature**—General Assembly (convened Feb. 2, 1965); Senate, 36 members (23 Democrats, 13 Republicans); House of Representatives, 294 members (184 R, 110 D).

Education: School enrollment (1964-65)—public elementary, 392,513 pupils (14,300 teachers); public secondary, 167,566 pupils (10,150 teachers); nonpublic schools, 126,700 pupils (4,700 teachers); college and university (fall 1964), 72,957 students. **Public school expenditures** (1964-65)—\$305,000,000 (\$593 per pupil); average teacher's salary, \$6,975.

Public Finance (fiscal year 1964): Revenues, \$625,688,000 (sales tax, \$111,917,000; motor fuel tax, \$54,761,000; federal funds, \$109,777,000). Expenditures, \$612,139,000 (education, \$136,284,000; health, welfare, and safety, \$89,989,000; highways, \$166,255,000). **State debt**, \$629,742,000 (1964).

Personal Income (1964): \$9,075,000,000; average annual income per person, \$3,281.

Public Assistance (fiscal year 1965): \$57,332,874 to 89,365 recipients (aged, \$7,269,740; dependent children, \$34,875,731).

Labor Force (employed persons, July 1965): Agricultural, 17,300; nonagricultural (wage and salary earners), 1,010,730 (37.8% manufacturing, 16.5% trade, 9.9% government). **Unemployed persons** (July 1965)—53,100.

Manufacturing (1963): Value added by manufacture, \$4,477,894,000 (transportation equipment, \$896,131,000; primary metals, \$320,648,000; nonelectrical machinery, \$684,324,000; electrical machinery, \$476,181,000; fabricated metals, \$397,054,000; food and products, \$170,021,000).

Agriculture (1964): Cash farm income, \$150,091,000 (live-stock, \$89,380,000; crops, \$60,101,000; govt. payments, \$610,000). **Chief crops** (tons)—tobacco, 7,000 (ranks 13th among the states); hay, 247,000; alfalfa, 86,000; potatoes, 70,350; apples, 30,720; peaches, 4,080.

Mining (1964): Production value, \$21,850,000 (ranks 45th among the states). **Chief minerals** (tons)—lime, 39,000 (rank, 18th); sand and gravel, 10,088,000; stone, 5,864,000; clays, 212,000.

Fisheries (1964): Commercial catch, 5,000,000 pounds (\$1,000,000). **Leading species**—blackback flounder, 957,000 pounds (\$52,000); scup or porgy, 722,000 pounds (\$82,000); whiting, 396,000 pounds (\$10,000); clams, 326,000 pounds (\$136,000).

Transportation: Roads (1964), 17,507 miles (16,340 paved); motor vehicles (1965), 1,463,673; railroads (1964), 1,629 miles; airlines (1965), 7 (89 airports).

Communications (1964): Telephones (1965), 1,535,900; television stations, 7; radio stations, 46; newspapers, 26 (daily circulation, 855,077).

Social welfare measures adopted provide for mental health services and day-care centers for disturbed children. The Assembly also authorized the creation of a protective services unit in the Welfare Department to assist abused, neglected, or abandoned children.

A commission on higher education was established to supervise and coordinate all public higher education in the state. Connecticut's colleges and universities had 45,000 undergraduates in September 1965, or 15% more than in 1964.

Birth Control. The U.S. Supreme Court declared unconstitutional Connecticut's famous 1879 law prohibiting dissemination of birth-control information and devices. A birth-control clinic was opened in New Haven.

Economy. Business boomed in Connecticut in 1965. Bank debits rose 14%; manufacturing employment, 3.1%; and residential construction, 12.2%. Connecticut ranked second among the states in per-capita income.

NEW YORK THRUWAY AUTHORITY

CONSERVATION OF NATURAL BEAUTY, as in New York's Mohawk Valley, was aided by 1965 Highway Beautification Act, which encourages removal of roadside eyesores.

CONSERVATION

In many ways, 1965 brought new hope and confidence to those concerned with the conservation of America's natural resources. President Johnson, who has been more active in the field of conservation than any president since Theodore Roosevelt, called a White House Conference on Natural Beauty, which focused the country's attention on the creeping destruction of the urban and rural landscape. The president also asked the 89th Congress to surpass the splendid conservation record written by the

88th Congress in 1964, and Congress responded by passing the Highway Beautification Act, the Water Pollution Control Act, and the Food and Agricultural Act of 1965, as well as other measures to protect the natural heritage of the United States.

Nevertheless, as the country's population climbed to near the 200 million mark, all was not entirely hopeful for conservation. Agencies concerned with single-purpose or limited objectives in land use, notably those responsible for building big dams or major highways, caused conflicts and difficulties. Also, the proliferation of poorly planned or poorly

211

RURAL CONSERVATION is served by man-made pond on this farm in Taylor County, West Virginia. The pond provides water for stock, recreation, and fire protection.

UPI

supervised urban-industrial development continued to destroy or threaten to destroy both natural beauty and vital living space.

White House Conference on Natural Beauty. In Washington, D.C., on May 24 and 25, 1965, 1,000 persons attended the first White House Conference on Natural Beauty. Laurance S. Rockefeller was the chairman. The delegates, observers, and panelists considered means of improving the environment in which Americans live. Participants discussed the elimination or screening of junkyards, the control of highway billboards, the development of scenic roads and parkways, the landscaping of highways, the establishment of new city parks, open spaces, and recreation areas, and the planning of cities and suburbs. President Johnson told the conference that he would ask Congress to eliminate most billboards and junkyards from the country's highways. After the national conference, various state and regional groups met to discuss local problems.

Congress passed the Highway Beautification Act in October. The act provides for withholding federal highway funds from states that fail to eliminate billboards in scenic areas, or to screen or remove junkyards near rights-of-way on interstate and primary highways. In other legislation, Congress provided for the landscaping of some federal highways, and set up regulations to limit air pollution by automobile exhaust pipes.

Dams and Conservation. Vital wilderness areas, national parks, and other wild spaces were threatened during 1965 by the proposed construction of dams on some of the country's rivers. In Alaska, various groups continued to press for the construction of the Rampart Canyon Dam on the Yukon River. Many conservationists believed that this dam might do major damage to wildlife and wild land resources.

Conservationists who have felt secure about the future of the national parks were shocked by the proposal of the federal Bureau of Reclamation to build two massive dams—Bridge Canyon and Marble Canyon—in the Grand Canyon of the Colorado River. The Bridge Canyon Dam would create a 93-mile-long reservoir that would flood the inner gorge of the Grand Canyon National Monument and extend 13 miles into the national park. The Marble Canyon Dam would stop the flow of the Colorado 12½ miles upstream from the Grand Canyon National Park. Both dams would serve principally to produce hydroelectric power, which conservationists maintain can be produced more cheaply by the use of fuel-burning plants.

Other proposals that worried conservationists involved (1) the Tellico Dam on the Little Tennessee River, the last unimpounded river in the TVA system; (2) a dam at Lower Sun Butte in Montana that would back up a major reservoir into the incomparable Bob Marshall Wilderness Area of Montana; (3) a dam on the Sespe River in California that would threaten the few surviving California condors; and (4) the Spruce Park Dam on the middle fork of the Flathead River in Montana that would both destroy a potential addition to the national wild river conservation program and flood an important wilderness region. (See also DAMS.)

To balance this tendency toward destruction of wild country by dams, Congress considered a bill that would give immediate protection to some of the nation's wild rivers. This bill would establish as designated wild rivers the Salmon River and middle fork of the Clearwater in Idaho, the Rogue in Ore-

gon, the Rio Grande in New Mexico, the Green in Wyoming, the Suwannee in Georgia and Florida, and nine other rivers. The first rivers to be set aside as a national riverway in 1965 were the Current and Jacks Forks rivers in the Ozark Mountains of Missouri.

Parks and Seashores. The creation in 1964 of the Canyonlands National Park in Utah was the first such action by Congress in 17 years. In May 1965, President Johnson signed a bill establishing the Nez Percé National Historical Park in Idaho.

Perhaps the most controversial proposal was that to establish the Redwoods National Park in northwestern California, advanced early in 1965 by the National Park Service. Creation of this park, which would protect the ancient redwood forests of California in an area now subject to logging, was opposed by the timber industry.

There is a developing national seashore system. In 1964 Congress approved the establishment of Fire Island National Seashore, New York. In 1965 it set aside the Assateague Island area, a 32-mile-long section off the coast of Maryland and Virginia as part of the system. (See also NATIONAL PARKS.)

UPI

SAVING FARMLAND is an important part of the conservation effort. Program in Monroe County, Wis., includes fallow sections, contour plowing, and protected streams.

Cropland Adjustment. The Food and Agricultural Act of 1965 contained a new farm program that held considerable hope for conservation. Title VI of this act enables the secretary of agriculture to enter into contracts with farmers to convert cropland into vegetative cover useful for soil, water, wildlife, or forest conservation. For five years about 8 million acres will be retired annually from crop use under this program and will be added to lands useful for conservation and public recreational purposes.

Research. An amendment to the Department of the Interior's appropriation bill for 1965-66, sponsored by Senator Karl Mundt of South Dakota, provided for a new research laboratory at the Patuxent Wildlife Research Center in Maryland. This laboratory will serve as a much-needed study facility for the preservation of such endangered wildlife as the whooping crane, California condor, Attwater prairie chicken, black-footed ferret, and Hawaiian nene.

Bills were introduced into Congress in 1965 to provide for research studies or surveys for the proper understanding, management, and preservation of natural environments. An ecological survey agency to be established within the Department of the In-

terior would be enabled to grant contracts to qualified universities, museums, or other agencies or individuals for the necessary research. The bills were not enacted in 1965.

Water Pollution. An expanded and strong Water Pollution Control Act was passed by Congress and signed into law. As a most important feature of this act, a Water Pollution Control Administration was created in the Department of Health, Education, and Welfare. A new assistant secretary to direct this agency has the primary responsibility for controlling water pollution, and will be provided with sufficient funds to establish standards, provide pollution-control demonstrations, and carry out essential studies. Severe drought in the northeastern United States served to point out the inadequate measures that previously had been taken in both watershed management and water pollution control. It was also learned that the water of such major rivers as the Potomac is too polluted to be useful for urban water supply. To alleviate the water shortage, the federal government continued its efforts in 1965 to develop desalinization plants along the eastern seaboard.

THE WHITE HOUSE

AT SIGNING OF HIGHWAY BEAUTIFICATION ACT on October 22, President Johnson presents a pen to Mrs. Johnson, who was one of the chief supporters of the bill.

Public Land Law Review. Congress established a Public Land Law Review Commission in 1965 to review the status of public lands and make recommendations for their retention or disposal. The commission was organized under Representative Wayne Aspinall of Colorado and began to take action. It will study lands in public ownership and recommend retaining those that have a primary value for domestic livestock grazing, timber production, wildlife protection, watershed control, outdoor recreation, or other public uses, if by transferring such lands to other ownership these uses would be lost. (See also WATER SUPPLY.)

RAYMOND F. DASMANN
Chairman, Division of Natural Resources
Humboldt State College

CONSUMER CREDIT

At the end of the first three quarters of 1965, consumer credit in the United States was at a peak of \$81.9 billion. This represented a rise of \$5.1 billion above the level of December 1964, and \$8.4 billion above that of September 1964. Consumer credit includes all credit extended to individuals for household and personal expenditures, except real estate mortgage loans.

A rapid expansion of consumer credit began in March 1965 and consisted largely of the increased use of installment credit. Although repayments on installment loans in the first half of 1965 reached a record 14.4% of disposable personal income—that is, personal income remaining after payment of personal taxes and the like—consumers continued to add substantially to their installment debts.

The total consumer credit outstanding in September 1965 represented about 17% of total disposable personal income, or approximately the same ratio which prevailed in 1964. The new, higher level of consumer credit developed largely because of the use of such credit by more middle-income families, rather than an increase in consumer debt relative to the incomes of credit-using families.

Installment Credit. At the end of December 1964, the major portion of the \$76.8 billion of consumer credit was installment credit totaling \$59.4 billion. The latter consisted of \$24.5 billion of installment sale credit on automobiles, most of which was provided by commercial banks and sales finance companies, and a relatively small portion by other finan-

cial institutions and automobile dealers. Installment credit for other consumer goods (secured usually by the items purchased, and including revolving credit plans of retail stores) amounted to \$15.3 billion. About one half the total was provided by commercial banks and sales finance companies, and the other half by retail outlets such as department and furniture stores. Repair and modernization installment loans for owner-occupied dwellings totaled \$3.5 billion, which was extended mostly by commercial banks. Personal installment loans (signature-alone borrowing) amounted to \$16.1 billion, which was granted by commercial banks, sales finance companies, and other financial institutions.

Noninstallment Credit. The minor portion of total consumer credit in 1964 was noninstallment credit totaling \$17.4 billion. Single-payment loans, extended almost entirely by commercial banks, amounted to \$6.5 billion. Charge accounts at stores amounted to \$6.3 billion (including balances owed on credit card and home-heating oil accounts). Service credit, the amount owed by individuals to professional practitioners and service establishments for such items as medical care and public utility services, totaled \$4.6 billion.

Trends in 1965. At the end of September 1965, consumer credit was 6.6% above the level in December 1964 and 11.4% above the level in September 1964. Installment credit was 9.1% above the year-end level, and 12.7% above the September 1964 level. These increases were slightly greater than those of the corresponding periods in 1963–64. Noninstallment credit was 0.2% below the year-end level, but it exceeded the level of September 1964 by 6.2%.

Automobile credit, the largest component in installment credit, showed increases in September of 12.7% and 13.6%, respectively, as compared with December and September of 1964. Credit for other durable goods declined in the first quarter, and then increased to a level in September slightly above the December level but 12.7% greater than a year earlier. Repair and modernization loans showed only a fractional increase. Personal loans were 10% higher than in December and 3.4% higher than a year earlier. Commercial banks supplied slightly more than half the total increase of installment credit in the first three quarters of 1965.

Single-payment loans, the largest component of noninstallment credit, showed increases in September of 6.1% and 8%, respectively, as compared with December and September 1964. Charge accounts at

stores declined in the first quarter of 1965 and then rose to a September level of 12.7% below the December 1964 level, but 5.7% higher than the level in September 1964. Service credit increased slightly in the first four months of the year, but then declined to a level in September 1965 about 2% higher than in December 1964, and 4.4% higher than a year before.

COPPER

World production of mined copper in 1964 rose to a record 5,420,000 short tons. This was 4% higher than the 1963 total of 5,210,000 tons, according to the U.S. Bureau of Mines. Chile, Zambia, and South West Africa all increased their output. The United States provided 23% of the world's mined copper in 1964; the USSR, an estimated 14.2%; Zambia, 13.7%; and Chile, 12.8%.

World output of smelter copper rose to a new record of 5,750,000 short tons, or almost 5% higher than the 1963 total of 5,480,000 tons.

U.S. Production. In 1964, domestic output of mined copper increased 3%, to a record 1,246,780 short tons. Production of smelter copper from domestic and foreign ores (exclusive of scrap) rose from 1,296,700 tons in 1963 to 1,338,433 tons in 1964. Arizona mined 55.4% of the national total, increasing its output in 1964 by 4.5%.

U.S. MINE PRODUCTION OF COPPER
(In short tons)

State	1961	1962	1963	1964

Source: U.S. Bureau of Mines.

In the first nine months of 1965, the U.S. mined recoverable copper output totaled 1,019,233 short tons—a 4% increase over the 910,426 tons mined in the first nine months of 1964. In the same periods, smelter output rose 9%, to 1,071,089 tons from 979,287 tons.

U.S. Consumption. Consumption of new copper in the United States was the largest since 1944, with 1964 showing an increase of 1,825,300 tons over 1963. Consumption of copper in the free world was estimated to be 10% higher in 1964 than in 1963.

U.S. Trade. U.S. imports of copper ore and concentrates in 1964 increased by 7%, with Canada supplying 48% of the total. There was an overall 6% increase in imports of blister copper. Imports of refined copper increased 16%, with Canada supplying 62%, and Peru 21%. Imports of scrap rose 56%.

U.S. exports of refined copper increased 2% over 1963, with West Germany, Italy, and Britain as the major importers. France, India, and Japan also took

substantial shipments. Japan received 44% of the copper scrap and 77% of the copper-base scrap exported by the United States. (See also MINING.)

International Activities, U.S. Bureau of Mines

COST OF LIVING

The general level of prices in the United States rose slightly in 1965. The average of retail prices of 400 items used to measure changes in the cost of living increased 1.3% in the first three quarters of 1965. In September the average was 1.7% higher than a year before, and 0.5% greater than the annual rate of increase for the six years following 1958. During these six years the average of wholesale prices for about 2,200 items fluctuated fractionally and increased only 0.1% for the entire period. However, in the first three quarters of 1965 the wholesale average increased 2.3%, and in September it was also 2.3% higher than a year earlier.

Consumer Spending. Demand for many consumer durables increased substantially during the year, particularly the demand for automobiles. Demand for nondurables and services increased appreciably and in about equal percentages. In general, total consumer spending expanded in each quarter of 1965. The substantial rise in total personal income and in disposable personal income came about partly because of the slight reduction of personal income taxes that took effect in 1965. In addition, the rate of personal saving decreased fractionally, and greater use was made of credit for consumer purchases. (See CONSUMER CREDIT).

In related areas, the levels of both federal government expenditures and business investments rose in 1965 over 1964.

Production. In 1965, as before, producers were able to supply large quantities of goods. Total crop production was estimated to be slightly above the all-time record of 1963. However, unfavorable weather restricted supplies of vegetables and fruits until the latter part of the year. Also, marketings of hogs and cattle were curtailed as a result of stockmen's reductions in breeding herds because of the low prices that prevailed in 1963 and 1964. Many industries operated slightly below their capacity, but the rate of use of production facilities was generally higher than in 1964.

In a few instances—for example, household appliances, television and radio sets, floor coverings, and textile products of manmade fibers—the increased availability of supplies and vigorous competition among sellers slightly lowered wholesale prices. During the second half of the year total employment improved, and shortages of technicians and skilled workers appeared in many industries.

Consumer Price Index and Retail Prices. The consumer price index (1957–59=100), which shows average changes in retail prices of important goods and services purchased by city dwellers, rose from 108.8 in December 1964 to 110.2 in September 1965. The cost of living in September exceeded the December 1964 level by 1.3% and the September 1964 level by 1.7%. In broad groups of items, the prices of services were up 2.6% in September 1965 over a year earlier; nondurable commodities, up 2.1%; and durable commodities, up 1.1%.

In specific components of items included in the index, the average of retail food prices (which have "weight" or importance in the index of slightly more

than one fifth of the total) was 2.3% higher in September than a year ago. The rise in food prices during the spring and summer was a major contribution to the advance of the overall index. The average price of meats, poultry, and fish showed the greatest increase—8.3%—which was due largely to higher meat prices. Cereals and bakery products, and dairy products showed an increase in price of 1.3% and 0.7%, respectively. Prices of fresh fruits and vegetables rose sharply in May, June, and July to higher levels than in 1964, and then declined to a level in September that was 3.3% lower than in 1964.

Prices of housing items (which have weight in the index of about one third of the total) were 1.1% higher in 1965 than a year earlier, largely because of higher rents and higher costs of homeownership. The average of prices for fuel and utilities declined and was only 0.2% higher in September than a year earlier. This decline was due mainly to lower prices of gas and electricity. Prices of household furnishings in September were only fractionally higher than a year before.

CONSUMER PRICE INDEX FOR EIGHT LARGE CITIES
(1957-59=100)

City	August 1965	August 1964	Percent change 1964 to 1965
Chicago.....	107.7	106.3	1.3
Cleveland.....	107.1	105.2	1.8
Detroit.....	106.8	104.3	2.4
Los Angeles.....	111.5	110.2	1.2
New York.....	112.6	110.5	1.9
Philadelphia.....	110.6	108.6	1.8
Seattle.....	111.5	110.3	1.1
Washington, D.C.....	109.6	108.7	0.8

Source: U.S. Department of Labor, Bureau of Labor Statistics.

The average of apparel prices (with weight of about one tenth) increased 1.2% during the 12-month period prior to September 1965, due mainly to higher prices of footwear. Prices of women's and girls' apparel increased slightly.

Prices of transportation (with weight of about one seventh) in September were 1.9% higher than a year earlier. This increase was the result of appreciably higher prices for both public and private transportation.

Of the remaining components of the index, prices of medical care and of miscellaneous goods and services increased 2.6% and 3.4%, respectively. The average of prices for reading materials and recreation remained approximately the same as a year earlier. The cost of personal care decreased fractionally.

Consumer Price Indexes for Urban Areas. Prices of

items included in the cost-of-living index are collected in 50 cities that are representative of urban areas in the United States. Separate indexes are calculated for each of the 17 largest cities. Figures for eight of these having indexes available in August are presented in the accompanying table. Comparison of city indexes shows that prices in one place may have changed more or less than in another. The indexes do not measure absolute differences in the cost of living between cities.

Among the eight cities represented in the table, the greatest increase in the cost of living between the 1957-59 base period and August 1965 occurred in New York (12.6%). The smallest increase occurred in Detroit (6.8%). During this period the national consumer price index increased 10.0%. From August 1964 to August 1965, the greatest increase in the cost of living occurred in Detroit (2.4%), and the smallest increase in Washington (0.8%). During this one-year period the national consumer price index increased 1.7%.

Wholesale Commodity Prices. The monthly wholesale price index of the U.S. Bureau of Labor Statistics rose rather steadily in the first three quarters of 1965. Higher prices for farm products and processed foods were mainly responsible for the appreciable increase in the index during the first half of the year. The average of industrial prices rose fractionally each quarter. In September the wholesale index (1957-59=100) reached an all-time high of 103, or 2.3% higher than a year earlier and 1.7% higher than the previous record high in September 1962.

The prices of farm products rose substantially in the first half of 1965 to the highest level in almost three years. They declined fractionally in the third quarter, but the average in September was 4% higher than a year before. Prices of livestock and live poultry were up 13%; of eggs, up 10%; and of fluid milk, up 1.4%. Prices of fruits and vegetables, plant and animal fibers, and grains were slightly lower than a year earlier.

The average of prices for processed foods declined fractionally in the first quarter of 1965, but rose thereafter to a level in September that was 4.4% higher than a year earlier. Prices of meats, poultry, and fish were up 9.6%; of crude vegetable oils, up 14.4%; and of animal fats and oils, up 22.4%. Substantially higher prices prevailed for refined vegetable oils and end products, sugar and confectionery, and miscellaneous items. Fractionally higher prices prevailed for cereal and bakery products, and dairy products. Only two subgroups, canned and frozen fruits and vegetables, and packaged beverage materials, were lower in price than a year earlier—0.6% and 4%, respectively.

The average of industrial prices in September 1965 was 1.6% higher than in September 1964. Prices of hides, skins, leather, and leather products were up 5.6%; of fuels and related products, up 4.2%; and of metals and metal products, up 3.2%. Appreciably higher prices prevailed for rubber products, lumber, pulp and paper, and miscellaneous products. Fractionally higher prices prevailed for textile products and apparel, chemicals, and all types of machinery. Prices of nonmetallic mineral products, tobacco products, and bottled beverages remained unchanged. Only one subgroup of the industrial index, furniture and other household durables, showed a decline (0.9%) in the 12-month period.

COSTA RICA

Costa Rican agriculture began a steady recovery in 1965 from the devastation caused by volcanic ash from Mount Irazú, which had been active from March 1963 to October 1964. Increased exports, especially to other member nations of the Central American Common Market (CACM), helped offset losses in agricultural production.

Agricultural Recovery. Crops recovered well from damage caused by volcanic ashfall in the Irazú area, and from insect damage in drought-stricken Guanacaste Province. Nevertheless, the 1964-65 coffee harvest was 50,000 metric tons under the expected 150,000 metric tons. In late 1965 the 1965-66 coffee crop was estimated at 120,000 metric tons. Coffee sales, initially slow to revive, showed nearly 90% recovery by the end of 1965.

Only corn, rice, and black beans, among major crops, remained substantially below normal levels. Milk production was back to normal because many dairymen moved from the Irazú area to the San

COSTA RICA · Information Highlights

Area: 19,575 square miles.

Population: 1,439,000 (May 31, 1965 est.).

Chief Cities (1963 census): San José, the capital, 101,162; San Sebastián, 23,166; Guadalupe, 21,413; Alajuela, 19,620.

Government: President—Francisco Orlich Bolmarich; First Vice President—Raúl Blanco Cervantes. Congress—57 members; party seating (1965): National Liberation (PLN), 29; National Republican (PRN), 19; National Union (PUN), 8; Popular Democratic Action (ACP), 1.

Religious Faiths: Roman Catholics, 78% of population; others, 22%.

Education: Literacy rate (1963)—84% of population aged 15 and over. Total school enrollment (1963)—298,169 (primary, 249,346; secondary, 33,622; teacher-training, 2,385; technical, 7,013; higher, 5,803).

Finance (1965 est.): Revenues, \$72,100,000; expenditures, \$69,500,000; public debt (1963), \$112,100,000; monetary unit, colon (6.62 colones equal U.S.\$1).

Gross National Product (1964): \$552,000,000.

National Income (1964): \$471,000,000; average annual income per person, \$340.

Economic Index: Cost of living (1964), 114 (1958=100).

Manufacturing (metric tons): Sugar (1964), 115,000; cement (1964), 33,000; beer (1963), 8,460; lumber (1962), 268,000 cubic meters.

Crops (metric tons, 1964-65 crop year): Coffee, 49,000 (ranks 15th among world producers; cocoa beans, 12,000 (world rank, 12th); dry beans (1963-64), 21,000.

Minerals (metric tons, 1964): Salt, 20,000; lime, 6,400; diatomite, 1,800; manganese (1963), 600; gold, 3,000 troy ounces.

Foreign Trade (1964): Exports, \$113,900,000 (chief exports: coffee, \$48,100,000; bananas, \$28,290,000; cacao, \$4,060,000); imports, \$138,600,000 (chief imports, 1963: electrical machinery, \$7,852,000; petroleum products, \$7,426,000; iron and steel, \$5,878,000). Chief trading partners (1963): U.S. (took 56% of exports, supplied 48% of imports); West Germany (took 18% of exports, supplied 12% of imports); Netherlands (took 6% of exports, supplied 3% of imports).

Transportation: Roads (1964), 11,931 miles (683 paved); motor vehicles (1964), 33,713 (automobiles 22,017); railways (1963), 407 miles; merchant vessels (1964), 3 (8,000 gross registered tons); national airlines, LACSA; principal airport, El Coco, near San José.

Communications: Telephones (1964), 20,400; television stations (1964), 3; television sets (1964), 35,000; radios (1961), 81,000; newspapers (1961), 6 (daily circulation, 115,000).

Carlos Valley. Banana production expanded in 1965, partly because the Standard Fruit Company resumed exports to Europe.

In August the Inter-American Development Bank approved a \$5.2 million loan to rehabilitate the zones harmed by volcanic eruption, and to resettle 500 families. The six-month drought in Guanacaste Province, and a massive mudslide on Irazú, near Cartago, in late November harmed agricultural production in those areas.

Economic Conditions. Higher coffee prices on the international market, increased exports of sugar to the United States and of manufactured goods to CACM countries, helped the Costa Rican economy in 1965. On July 20 a barter bill was promulgated to widen trade with East Germany, Yugoslavia, Poland, Nationalist China, Austria, Sweden, and other countries.

Foreign investment in new plants in Costa Rica took an upward swing in 1965. Important investments were made in new plants for bauxite extraction, and for the manufacture of insecticides, textiles, cigarettes, vegetable oils, and tires.

A "March of the Unemployed" on the presidential palace took place in June. Unemployment in Costa Rica continued to average about 15%, with about 15,000 new job seekers entering the labor force annually. Doctors, government workers, teachers, and pharmacists were promised wage increases for 1966.

Election Campaigns. Campaigning began in 1965 for the presidential and congressional elections scheduled for Feb. 6, 1966. The incumbent National Liberation party, pledged to a Socialist welfare program, backed Dr. Daniel Oduber Quirós, a lawyer. His opponent for the presidency is José Joaquín Trejos Fernández, former dean of economics at the University of Costa Rica. Trejos, the candidate of the National Unification party, was endorsed by several other opposition parties. The opposition, essentially a coalition of conservative parties, charged that government restrictions and lack of easy credit have stifled private initiative and slowed industrial expansion.

Foreign Affairs. The Revolutionary Recovery Movement, an anti-Castro group, ended an 18-month training period in Costa Rica in March.

In May, Costa Rica voted in favor of the creation of the Inter-American Peace Force to help restore order in the Dominican Republic. It was among the first countries to send volunteers to serve in the force. In August, President Orlich issued a statement explaining that the government opposed unilateral intervention in the Western Hemisphere, but would support a permanent inter-American force to prevent Communist take-overs.

Professor of History
University of the Pacific

COTTON

The 1965 U.S. cotton crop, estimated at 15,059,000 bales (of 500 pounds each), was down about 1% from the 15,180,000 bales produced in 1964, but nearly 3% above the 1959-63 annual average of 14,670,000 bales. The national 1965 average of 531 pounds of lint (unginned cotton) per harvested acre exceeded the record 1964 yield by 14 pounds, and the 5-year average by 67 pounds. As before, California, with 1,142 pounds per acre, had the highest yield among the states.

Cotton was planted on 14,152,000 acres—684,000

less than in the previous year, and 1,775,000 below the 5-year average. Of this total, 14,074,700 acres were planted in Upland cotton and 77,300 acres in American Egyptian. The crop included 85,800 bales of American Egyptian cotton.

COTTON PRODUCTION BY LEADING STATES¹

State	Average 1959-63 (bales)	1964 (bales)	1965 (bales)
Texas.....	4,538,000	4,122,000	4,725,000
Mississippi.....	1,712,000	2,232,000	2,020,000
California.....	1,837,000	1,760,000	1,725,000
Arkansas.....	1,457,000	1,570,000	1,450,000

¹ In 500-pound gross-weight bales containing about 480 pounds of lint. (Source: Statistical Reporting Service, U.S. Department of Agriculture.)

Record U.S. Supply. Cotton stocks carried over into the 1965-66 marketing year totaled 14,291,000 bales, or 1,913,000 more than a year earlier. With the second largest carry-over in history, the 1965-66 total cotton supply, including imports, was estimated at 29,485,000 bales. This total exceeded the 1964-65 supply by 1,744,000 bales and constituted the greatest U.S. supply on record.

World Production. Total cotton output of all countries in crop year 1965, estimated at 52,034,000 bales, narrowly topped the preceding season's record of 52,017,000 bales (revised estimate) by 17,000 bales. It exceeded the 1955-59 average by 19%. Production outside the United States amounted to 36,875,000 bales, compared with the crop-year 1964 output of 36,837,000 bales and the 1955-59 average of 30,873,000 bales. World acreage was slightly higher and yields slightly lower than before.

COTTON PRODUCTION BY LEADING COUNTRIES¹

Spain.....	209,000	355,000	365,000
Guatemala.....	59,000	312,000	350,000

¹ All production, other than U.S., is in bales of 480 pounds net. U.S. production is in 500-pound gross-weight bales which, however, contain about 480 pounds of lint. Years shown refer to crop years beginning August 1. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

Free-world production outside the United States in crop year 1965 was over a third of a million bales higher than the record production of the previous season, and marked the sixth consecutive year that a new record had been set.

CREDIT UNIONS, Federal. See SOCIAL SECURITY.

CRIME

Again in 1965, crime continued its upward trend throughout the world. Especially disturbing was the rise in crimes of violence and the increase in juvenile delinquency. This article reviews the subject under the following headings: (1) Crime Trends; (2) Delinquency Trends and Prevention Programs.

CRIME TRENDS

Crime in the United States was 5% higher in the first six months of 1965 than in the same period of 1964, according to the Uniform Crime Reporting Program of the Federal Bureau of Investigation (FBI). Suburban areas showed an upward trend of 9%, and rural areas, 1%. All cities had crime increases, ranging from 2% in cities with more than 1 million population to 9% in cities with 100,000 to 250,000 population.

Crimes of violence were up, led by forcible rape, with an increase of 7%, followed by murder, with an increase of 6%; robbery, 5%; and aggravated assault, 3%. Property offenses also increased, with burglary and larceny (\$50 and over) up 6% each, and auto theft up 4%.

Serious Crimes. In the United States in 1964, serious crimes increased 13% over 1963, with an all-time high of 2,604,400 offenses. These included murder, forcible rape, robbery, aggravated assault, burglary, larceny (\$50 and over), and auto theft. Crimes against property showed an overall increase of 13%. Auto theft climbed 16%; larceny (\$50 and over), 13%; and burglary, 12%. Crimes against the person showed a 15% rise as a group, with forcible rape up 21%; aggravated assault, 17%; robbery, 12%; and murder, 8%.

Since 1958 the incidence of crime has outpaced the growth of population almost six times, and this trend is continuing. While the major portion of the increase was due to the rise in crimes to property, alarming increases were also recorded in crimes of violence—murder, forcible rape, robbery, and aggravated assault. Since 1958, violent crimes as a group have increased three times faster than the population growth. In 1964 each type of violent crime showed a substantial rise when related to population, with the murder rate up 7%, forcible rape up 20%, robbery up 10%, and aggravated assault up 15%.

For each 1,000 persons in the United States in 1964, there were 14 serious crimes and victims. More than 1,110,000 burglaries were committed, and stolen property was valued at over \$971,000,000. Areas having the fastest growing populations generally reported the highest crime rates.

Arrests. Of a total of 4,685,080 persons arrested in the United States, 4,138,099 were males, and 546,981 were females. Young people under 18 years of age continued to show an increasing involvement in unlawful activity. Nationwide arrests of these persons for all offenses, except traffic violations, were up 17% during the 1964 calendar year. Youthful offenders comprised 9% of arrests for murder, 15% for aggravated assault, 19% for forcible rape, 28% for robbery, 51% for burglary, 54% for larceny, and 64% for auto theft.

Of 4,381,419 arrests, white persons accounted for 3,053,818. Negroes accounted for 1,194,377, American Indians for 99,195, Chinese for 1,097, Japanese for 2,488, and all others (including those listed as race unknown) for 30,444.

Police Data. Eighty-eight law-enforcement officers died in the line of duty in 1964, 57 of them

murdered by criminals. Ten of every 100 officers were victims of attacks in 1964. Although the total number of persons employed as local and state police increased substantially during 1964, the ratio of police to population remained at 1.9 police employees per 1,000 population, as in 1963.

Director, Federal Bureau of Investigation

DELINQUENCY TRENDS AND PREVENTIVE PROGRAMS

The most reliable statistical reports on juvenile delinquency, the FBI's *Uniform Crime Reports* and the U.S. Children's Bureau's *Juvenile Court Statistics*, show a substantial increase in juvenile delinquency since 1948, after a decline immediately following World War II.

Juvenile Delinquency in the U.S. In 1964 about 686,000 juvenile delinquency cases (excluding traffic offenses) were handled by the juvenile courts in the states, involving some 591,000 children aged 10 through 17. The total shows an increase of 14% over the previous year, while the child population increase was only 4%. More than four times as many boys as girls were referred to juvenile courts. Most of the offenses were committed against property, but a growing proportion are of a violent type.

The rate of delinquency (the number of cases per 1,000 child population) was about three times higher in predominantly urban areas than in rural regions. Although increases in delinquency have occurred in suburban and rural areas, the greatest increase is in the "inner city" areas of the large metropolitan centers, where there is a concentration of economic deprivation, family problems, educational deficiencies, school dropouts, and adult crime. The average age of juveniles coming to the attention of police has become lower, with more youths in their early teens involved.

International Trends. Nearly all countries have

experienced increases in law violation, including violent gang activities and riots. In every country the chief burden of dealing directly with offenders is carried by the established agencies of government, especially the police, courts, correctional institutions, and related probation and parole services.

The Third UN Congress on the Prevention of Crime and the Treatment of Offenders met in Stockholm, Sweden, on Aug. 9-18, 1965. More than 1,000 government officials, research specialists, and other experts, representing 75 nations, took part in the deliberations. The theme of the congress was "Prevention of Criminality," and the main subjects discussed were: (1) social change and criminality; (2) social forces and the prevention of criminality, with emphasis on the role of the public, the family, and educational and occupational opportunities; (3) community prevention action, particularly medical and social programs; (4) measures to combat recidivism (relapse into delinquency); (5) probation and noninstitutional measures; and (6) special pre-

ventive and treatment measures for young adult criminals. The United Nations also conducted regional training courses in Cairo and Monrovia, and held a series of international training courses in Asia and the Far East for public officials concerned with law enforcement, correction work, and preventive programs.

U.S. Government Programs. On July 26, 1965, President Johnson named a 19-member Commission on Law Enforcement and Administration of Justice, with Attorney General Nicholas deB. Katzenbach as chairman. The commission has wide authority to seek out "comprehensive national answers" to the mounting crime problem. Its chief assignment is to make a nationwide study of the whole field of crime problems, ranging from the analysis of cases to the rehabilitation of offenders. The Juvenile Delinquency and Youth Offenses Control Act was extended through the fiscal year 1967 to enable the completion of the comprehensive community programs launched under the act, and to afford an opportunity to evaluate the results. The focus is now primarily on smaller short-term, specialized demonstration and training projects. Special attention is being given to manpower needs and training in crime and delinquency prevention.

State Programs. The Juvenile Delinquency Committee of the National Governor's Conference has actively supported efforts to coordinate various delinquency-prevention programs operated by state agencies. The National Council of Juvenile Court Judges launched a training program in 1962 for juvenile and family court judges and personnel, administered under a grant from the National Institute of Mental Health. Since then, training institutes and conferences have been conducted in various regions, and studies have been made of the judges themselves. (It is estimated that of the 9,000 judges in the United States, approximately 3,000 are given statutory responsibility for juvenile court jurisdiction, of whom only 250 exercise full-time juvenile court responsibilities.)

The increase in juvenile crime has outstripped correctional facilities, and the increasing cost of institutional care has led to experimentation with substitutes for incarceration. Correctional practitioners are increasingly recognizing the important part the community can play in the correctional process, as evidenced by the California and Provo, Utah, community-centered correctional experiments. Correctional programs built around community facilities, to supplement or replace penal incarceration, proceed on the assumption that the most effective method to redirect behavior is to operate in an environment that most nearly approximates the kind of social world in which juveniles must learn to live as law-abiding citizens.

Bibliography. *The International Bibliography on Crime and Delinquency*, obtainable from the National Institute of Mental Health, Bethesda, Md., is the most comprehensive bibliographical source on crime and delinquency. Prepared for the National Clearinghouse for Mental Health Information by the Information Center on Crime and Delinquency of the National Council on Crime and Delinquency, the bibliography contains annotated references and citations, as well as abstracts of current literature on crime and delinquency, and summaries of continuing projects.

CUBA

Premier Fidel Castro surprised the world on Sept. 28, 1965, when he announced in a radio and television speech from Revolutionary Square in Havana, that all Cubans, except those of military age, who wished to leave Cuba would be free to do so. The United States government, although unsure of the intentions behind this statement, took up Castro's challenge. On October 3, President Johnson declared that "those in Cuba who seek freedom" would be permitted "to make an orderly entry into the United States of America." After more than a month of negotiations, an agreement was reached that may result in 300,000 Cubans immigrating to the United States within the next seven or eight years.

Neither the Cuban nor the United States government expected the refugee agreement to improve relations between the two nations. In 1965, Cuba maintained its policy of hostility toward the United States and continued its subversive activities in the Western Hemisphere. It seemed clear that Castro, who had vacillated in the past, had decided to side with the Soviet Union in the Sino-Soviet ideological dispute. At home, Castro struggled to consolidate his dictatorship, to build up the economy, and to reactivate revolutionary fervor.

Cuban Exodus. In early October, a week after the exchange between Castro and Johnson, Castro established a refugee embarkation port at Camarioca, and Cubans began an exodus to Florida in small boats sent by their relatives in the United States. The U.S. government tried to discourage this illegal and dangerous method of entry and initiated negotiations, through the Swiss embassy in Havana, for an orderly transfer of emigrants. An agreement was reached on November 6, but before that date at least 3,000 Cubans had reached Florida by boat, and several others were lost at sea.

By the terms of the November 6 accord, 3,000 to 4,000 Cubans were to be airlifted to Miami, Fla., each month, with priority given to those with close relatives in the United States. The flights began on December 1. Prior to 1965, the United States had spent \$185 million to assist Cuban refugees; \$30 million was budgeted for 1965, and Congress appropriated another \$12.6 million to handle the new situation.

Observers, speculating on Castro's reasons for permitting the exodus, felt that he wished to rid Cuba of discontented citizens while easing the shortage of consumer goods at home. The Castro regime also would benefit by confiscating the property of the emigrants. Castro commented that "this revolution should be a free association of people who want to live here."

U.S.-Cuban Relations. Some officials in the United States and Cuba privately thought that the indirect negotiations on the matter of refugees would ease tensions between the two nations and might pave the way for their resumption of trade and diplomacy, but publicly the Cuban government continued its harangues against "Yankee imperialism," and the United States pursued its policy of isolating Cuba.

On Jan. 1, 1965, the sixth anniversary of his seizure of power, Castro displayed land-to-land missiles and jet planes supplied by the Soviet Union, and censured the United States as Cuba's enemy. Four days later Cuba and Communist China announced the conclusion of a five-year trade pact designed to make "new contributions to the struggle

Area: 44,218 square miles.

Population: 7,631,000 (July 1, 1965 est.).

Chief Cities (est.): Havana, the capital, 978,400 (1964); Marianao, 230,000 (1960); Santiago de Cuba, 219,800 (1964); Camagüey, 162,400 (1964).

Government: President—Dr. Osvaldo Dorticós Torrado (took office July 18, 1959); Premier—Fidel Castro Ruz (seized power Jan. 1, 1959).

Religious Faiths: Roman Catholics, 79% of population; others, 21%.

Education: Total school enrollment (1962)—1,322,763 (primary, 1,121,009; secondary, 123,118; teacher-training, 18,525; technical, 42,502; higher, 17,609).

Finance (1965 est.): Revenues, \$2,535,000,000; expenditures, \$2,535,000,000; monetary unit, peso (1 peso equals U.S.\$1). Gross National Product (1963): \$3,891,000,000. National Income (1963): \$3,697,000,000; average annual income per person, \$513.

Agricultural Production Index (1963): 85 (1956–57=100).

Manufacturing (metric tons): Sugar (1964), 6,000,000; gasoline (1961), 710,000; cement (1964), 350,000.

Crops (metric tons): Rice (1964), 160,000; citrus fruits (1964), 86,000; peanuts (1962), 15,000; sisal (1963), 10,000; coffee (1962), 3,000; cocoa beans (1964), 2,000.

Minerals (metric tons, 1964): Manganese, 75,700 (ranks 16th among world producers); nickel, 17,000 (rank, 4th); salt (1963), 80,000; chromite (1963), 50,600; pyrites, 30,500; copper (1963), 6,000; iron ore, 1,000.

Foreign Trade (1964): Exports, \$714,000,000 (chief exports to the free world, 1962: sugar, \$715,410,000; molasses, \$19,415,000; tobacco, \$17,894,000); imports, \$1,015,000,000 (chief imports from the free world, 1962: pharmaceuticals, \$14,548,000; jute fabrics and bags, \$8,373,000; rice, \$7,118,000). Chief trading partners (1963): USSR (took 30% of exports, supplied 53% of imports); Communist China (took 13% of exports, supplied 10% of imports); Czechoslovakia (took 6% of exports, supplied 7% of imports).

Transportation: Roads (1964), 8,300 miles; motor vehicles (1963), 131,500 (automobiles, 91,000); railways (1963), 3,562 miles; merchant vessels (1964), 34 (144,000 gross registered tons); state airline, Cubana; principal airport, Havana.

Communications: Telephones (1964): 223,745; television stations (1964), 27; television sets (1964), 500,000; radios (1961), 1,300,000; newspapers (1961), 10 (daily circulation, 611,000).

against imperialism headed by the United States.” However, on Jan. 2, 1966, Castro announced that China had broken its rice-for-sugar agreement.

Castro received a delegation of South Vietnamese Vietcong rebels early in 1965, and during the year he repeatedly offered to send troops to fight with the Vietcong against the South Vietnamese government and the United States. He also donated 1.5 million tons of used clothing and 10,000 tons of sugar to North Vietnam and sent a Cuban ballet troupe to entertain there.

On April 8 the Cuban government announced the arrest of 53 members of an “espionage ring,” including two American Baptist ministers. The Americans were later tried, convicted, and sentenced to prison terms of 6 and 10 years, respectively. On April 19, Castro accused the United States of instigating counterrevolution, smuggling “huge quantities of arms,” and staging raids from “bases in Miami and Central America.” The government arrested 31 Cuban counterrevolutionaries on May 12, some of whom were accused of spying for the U.S. Central Intelligence Agency (CIA).

On October 15, Foreign Minister Raúl Roa, in an address to the UN General Assembly, called upon Latin Americans, Asians, and Africans to rise in

opposition to the “Yankee imperialists.” He invited representatives of the three groups to meet in Havana in January 1966, to plan joint action against United States policies. The speech was so violent that the U.S. delegation, for the first time, left the assembly hall while Roa was speaking.

Cuban Subversion. Relations with the United States were not likely to improve so long as Cuba continued to operate as a Communist base for organizing, training, financing, and launching “wars of national liberation” in the Western Hemisphere. On April 18, 1965, Premier Castro stated: “Our greatest wish is not only revolutions in Latin America but in other areas as well.” The following day he predicted victory for the guerrilla forces in Colombia, Venezuela, and Guatemala. The U.S. undersecretary of state, Thomas C. Mann, declared on October 12 that Communist subversion in the Western Hemisphere was perhaps more dangerous than ever. He said specifically that “a Communist state” (Cuba) had intervened in the Dominican Republic by “training, directing, financing, and organizing indigenous Communist elements to take control of the government . . . by force and violence.”

In 1965, Cuba broadcast an average of 155 hours per week of Communist propaganda to Latin Amer-

UPI

ica. At least 30 terrorist and guerrilla warfare schools or camps in Cuba were engaged in preparing Latin Americans for "wars of national liberation."

On January 18 the Soviet news agency, Tass, reported that Communist party delegates from 22 Western Hemisphere countries had met in Havana in November-December 1964 to work for greater unity in the Communist movement. The Tass communiqué stated that Communist revolutionaries in Venezuela, Colombia, Guatemala, Honduras, Paraguay, and Haiti would receive active aid in their effort to seize power by force.

Cuba is primarily a Soviet military base, but it is valued by all the Sino-Soviet powers for use in fomenting subversion in Latin America. In late August, Rear Adm. John D. Bulkeley, commander of the U.S. naval base at Guantanamo, said: "The Communist bloc operates 84 ships daily to supply Cuba. It's costing them \$1.5 million a day." United States intelligence sources estimate that there are only about 2,000 to 3,000 Soviet military personnel in Cuba, and the State Department has reported that Castro now has operational control over the 24 SAM sites and 500 missiles. The House Subcommittee on Inter-American Affairs found no evidence to support rumors of additional "missiles in caves . . . or movement in by below-deck shipment on vessels."

Political Developments. Premier Castro has declared that Cuba will have a Socialist constitution by 1969. In the meantime, he heads a dictatorship of the Communist party. On Oct. 1, 1965, the ruling United Party of the Socialist Revolution (PURS) was renamed the Communist party, and a new 100-member Central Committee, headed by an 8-man Politburo (including Fidel Castro and his brother, Raúl) was set up as its governing body.

The Cuban population is controlled mainly through an elaborate spy network known as the Committee for the Defense of the Revolution (CDR). As many as one out of four Cubans spy on their neighbors for the committee. According to their reports, citizens are categorized as "revolutionary" (progovernment) or "gusano" (antigovernment). In periods of crisis, the armed forces round up all the "gusanos" (worms). Early in 1965 it was estimated that 75,000 political prisoners were incarcerated in the country's 56 prisons and jails, 23 concentration camps, and 9 rehabilitation farms. Thousands of Cubans have been executed for offenses against the state.

Although the dictatorship remained in firm control in 1965, there was evidence of tension within the regime. The principal sources of discord were

(1) the struggle for power between old-guard Communists and younger supporters of Castro, and (2) Cuba's stand in regard to the Sino-Soviet split.

Premier Castro fired a number of leading officials in 1964 and 1965. Most were old-guard Communists, such as Joaquín Ordoquí, who had been removed in 1964 from the directorate of PURS because of his "unclear political conduct," and Carlos Rafael Rodríguez, who was dismissed from his post as head of the National Institute of Agrarian Reform on Feb. 15, 1965. However, the ousted minister of labor, Augusto Martínez Sánchez had fought with Castro in the 1959 revolution.

By April 1965 the official coolness in Cuban-Soviet relations was replaced by warmth and cordiality. Premier Castro apparently realized that only the Soviet Union could supply the economic and military aid essential for Cuba's existence. At about this time, Minister of Industries Ernesto "Ché" Guevara, one of the chief architects of the Cuban revolution, dropped out of public view after completing a three-month trip to African and Asian countries. Experts and scholars speculated that the disappearance of Guevara was evidence of Cuba's pro-Soviet position. Guevara had openly criticized Soviet socialism and certain Soviet policies while expressing a pro-Peking line. On October 3, Castro announced that Guevara had resigned from the PURS and had left Cuba "for new fields of battle."

Economy. Good weather and the efforts of thousands of "volunteers" (including Premier Castro and members of his cabinet) resulted in a harvest of about 6 million tons of raw sugar in 1965, by far the best output since Castro seized power in January 1959. However, Castro is bound by trade agreements to barter a large part of his sugar to the Soviet Union and Communist China, so the bumper crop may not raise export earnings significantly. In neither 1964 nor 1965 did Cuba earn enough foreign exchange to pay for imports.

The inferiority of Soviet, Czech, and Chinese manufactured goods created a great demand for Western products. The Cuban government gave priority in 1965 to importing critical spare parts, transportation equipment, pharmaceuticals and veterinary supplies, breeding stock for cattle and poultry farms, books, and films.

Because Cuba is greatly in debt to the Communist countries, the Soviet Union has insisted that all industrial projects not related to sugar be shelved. Many factories remain inoperative, and consumer shortages in 1965 included shoes, clothing, meat,

and milk. Castro admitted that there would still be a shortage of 2 million houses in 1990. Economic studies indicate that socialism in Cuba from 1959 to 1965 resulted in a decline of 20–25% in gross national product and standard of living.

Education. Because so many of the hundreds of thousands of Cubans who have managed to escape from their homeland have come from the educated classes, Castro has made a strong effort to educate people to replace them. About 100,000 students were being trained for the new technical and managerial class in 1965. In an effort to elevate every person to at least the 6th grade level, "Workers-Peasants Improvement Forces" were created with 600,000 enrollees claimed for 1965.

CYPRUS

Fighting between Greeks and Turks in Cyprus was sporadic during 1965. An uneasy truce prevailed on the troubled island, thanks to the presence of the United Nations Forces in Cyprus (UNFICYP). But there was little progress toward a political settlement. UNFICYP's success in maintaining the peace, and the inability of the parties concerned to achieve a political solution, have led to the extension of UNFICYP's mandate. The mandate calls on UNFICYP "to use its best efforts to prevent a recurrence of the fighting and, as necessary, to contribute to the maintenance and restoration of law and order and a return to normal conditions." By late 1965, the mandate had been extended five times since it was first introduced in March 1964.

Origins of the Conflict. At the core of the dispute lies the insistence of the Turkish Cypriotes on the immediate implementation of their special rights as outlined by the constitution, which came into effect when the island gained independence from Britain on Aug. 16, 1960; and the determination of the Greek Cypriotes to alter these provisions of the con-

stitution. In the opinion of the Greek Cypriotes, the constitution gave disproportionate rights to the Turkish minority and provided such a rigid and complicated system of checks and balances that the normal political and constitutional growth of the island was permanently arrested. The Turks of Cyprus, representing 18% of the population, held, through the Turkish Cypriote vice president, veto powers on foreign affairs, defense, security, and some financial matters. The constitution called for a permanently fixed ratio of seven Greeks to three Turks in the House of Representatives.

The veto power was invoked frequently by the Turkish Cypriotes in order to force the Greek Cypriotes to implement fully the provisions of the constitution providing for an autonomous Turkish community in Cyprus. The Greek Cypriotes complained that the operations of the government were being paralyzed by the excessive use of the veto power, and on Nov. 30, 1963, President Makarios submitted to the Turkish Cypriotes his proposals for constitutional reform. They included the elimination of the Turkish veto power in noncultural affairs and the reorganization of the security forces and the public service according to the size of the population of the two communities. His proposals also called for the protection of the cultural rights of the Turkish Cypriotes.

On Dec. 16, 1963, the government of Turkey rejected the plan on behalf of the Turkish community and, five days later, clashes began on Cyprus that culminated in full-scale civil strife.

The Mediator's Report. The mediation efforts of the United Nations have proved less successful than efforts to bring an end to the fighting on Cyprus. In March 1965 the much awaited report of the UN mediator for Cyprus, Galo Plaza Lasso of Ecuador, was made public. The mediator stated that it was difficult for him to see how any proposed settlement of the Cyprus problem could succeed if it left open the possibility of *enosis* (union of the island with Greece) against the wishes of the Turkish-Cypriote community. The mediator also found that the practical objections to the geographic separation of the two communities (*taksim*) were almost insuperable. He noted that the Turkish Cypriote community's

KEYSTONE PRESS

CYPRUS gradually returned to peace in 1965 under watchful eye of British troops stationed on island, who helped to enforce the cease-fire that ended fighting between the Greek and Turkish communities.

constitutional rights were more extensive than any they might hope to secure in a future settlement.

The Turkish Cypriotes and the Turkish government accused Plaza of exceeding his duties and declared that he could not continue as mediator. The Greek Cypriotes and the Greek government approved the report with certain reservations and asked that the mediator's efforts be continued. The secretary general of the United Nations, U Thant, declared on April 2 that the mediator had not exceeded his authority.

Ankara and Moscow. In its efforts to block *enosis*, Turkey turned to the Soviet Union for support. Moscow was pleased to capitalize on the growing anti-American feeling in Turkey that had resulted from the neutral stand of the United States on the Cyprus issue. Turkey and the Soviet Union signed commercial agreements in February. Later, Moscow declared that a solution to the Cyprus problem should be based on respect for the independence and territorial integrity of Cyprus, and should recognize the existence of two national communities on the island.

The subtle shift in Soviet policy has strengthened Turkey's bargaining position, although the Soviet Union, in fact, determined to play it both ways with the Greeks and Turks. In the last resort, the Russians are bound to support the side that opposes both *enosis* and *taksim*. The union of the island with Greece or its partition between Greece and Turkey would drive underground the Communist party of Cyprus (AKEL).

The Two Cypriote Communities. The failure to agree on a compromise solution of the Cyprus problem reflects the irreconcilable positions of the two sides. The Greek Cypriotes, representing 80% of the population, insist on unfettered independence, a unitary state, and majority rule. They have indicated a willingness, however, to discuss with anyone an arrangement for the protection of minority human rights. On the other hand, the Turkish Cypriote leadership feels that at least one third of the island should be cleared of Greek Cypriotes and settled with a Turkish Cypriote majority, and that the two communities would then co-administer the island.

While both communities have been working to bolster their positions on the island, the Greek Cypriotes have had the edge. Their military forces are superior to those of the Turkish Cypriotes and they are in control of all the ports and of 98% of the island's territory.

The Greek Cypriotes are abolishing the separatist features of the 1960 constitution piecemeal. On July 23 the Greek members of the House of Representatives enacted two laws: one amending the electoral laws, and another extending the terms of office of President Makarios and the Greek members

of the House until Aug. 16, 1966. The new electoral law places the Greeks and Turks on a common footing and abolishes all the special provisions governing Turkish representation in the House of Representatives.

In August, Turkey denounced these innovations before the UN Security Council as a "flagrant violation of solemn international agreement. . . ." The Security Council unanimously reaffirmed its resolution of March 4, 1964, and called upon all parties "to avoid any action which is likely to worsen the situation."

On October 14, President Makarios presented his plan for Cyprus to the United Nations. It calls for a code of fundamental rights and freedom, and the presence in Cyprus of a UN commissioner and staff to ensure observance of the code's terms. It also provides cultural, educational, and religious autonomy for all minority communities, and membership in Parliament on the basis of proportional representation.

At the end of 1965 it appeared that no settlement is likely to be forthcoming without agreement between the Turkish government and the government of Archbishop Makarios.

Economy. The political disturbances in 1964 greatly hindered economic growth and initially caused a serious production loss in all sectors. But by the end of 1964 and well into 1965 the economy moved forward and in some cases surpassed the 1963 levels. The reasons for the improvements in the economy were various: the population's increasing confidence in the economic future of the country led to a growth in investment activity; the country enjoyed a good harvest; and the expenditures by the approximately 7,000 UNFICYP personnel helped to make up for the loss of tourist revenue.

CZECHOSLOVAKIA

The Communist leaders of Czechoslovakia, who were extremely slow to abandon Stalinist methods, finally took steps in 1965 to repudiate those attitudes and policies that had brought the country to the threshold of economic and intellectual stagnation. Czechoslovakia was once considered the most highly industrialized country in eastern Europe, but in 1963 it registered a sharp drop in its industrial output. As a result, Antonín Novotný, Communist party leader since 1953 and president of the republic since 1957, was forced to abandon the old policies and to approve the introduction of the new methods.

CZECHOSLOVAKIA · Information Highlights

Area: 49,370 square miles.

Population: 14,107,000 (Dec. 31, 1964 est.).

Chief Cities (1963 est.): Prague, the capital, 1,010,658 Brno, 321,491; Bratislava, 255,684; Ostrava, 248,416.

Government: President—Antonín Novotný (elected by the National Assembly, 1957); Premier—Jozef Lenárt (appointed 1963). Parliament—National Assembly, 300 members.

Religious Faiths: Roman Catholics, 64% of population; others, 36%.

Education: Total school enrollment (1962)—2,762,421 (primary, 2,272,790; secondary, 77,196; teacher-training, 8,575; technical, 276,262; higher, 127,598).

Finance (1964 est.): Revenues, \$18,113,000,000; expenditures, \$18,100,000,000; monetary unit, koruna (7.20 korunas equal U.S.\$1).

Net Material Product (1964): \$23,500,000,000.

Economic Indexes (1964): Industrial production, 148 (1958=100); cost of living, 98 (1958=100).

Manufacturing (metric tons, 1964): Crude steel, 8,377,000; cement, 5,493,000; wheat flour, 1,100,000; sugar, 1,091,000; fuel briquets and packaged fuel, 798,000; meat (1963), 775,000; gasoline (1963), 505,000.

Crops (metric tons, 1964): Sugar beets, 7,200,000 (ranks 7th among world producers); potatoes (1963), 6,506,000 (rank, 8th); barley (1963), 1,620,000 (rank, 11th); rye, 750,000 (rank, 6th); oats, 665,000 (rank, 14th); wheat, 1,739,000; maize, 381,000; rapeseed, 46,000.

Minerals (metric tons, 1964): Coal, 103,806,000 (ranks 8th among world producers); gypsum, 351,000 (rank, 19th); silver, 1,608,000 troy ounces (rank, 18th); iron ore, 2,846,000; lime, 2,347,000; pyrites, 361,000.

Foreign Trade (1964): Exports, \$2,576,000,000 (chief exports, 1962: machinery and equipment, \$1,044,000,000; fuels, minerals, metals, \$425,000,000; consumer goods, \$423,000,000; organic raw materials, \$142,000,000); imports, \$2,429,000,000 (chief imports, 1962: fuels, minerals, metals, \$627,000,000; machinery and equipment, \$542,000,000; organic raw materials, \$430,000,000). Chief trading partners (1963): USSR (took 39% of exports, supplied 39% of imports); East Germany (took 9% of exports, supplied 11% of imports); Poland (took 8% of exports, supplied 7% of imports).

Transportation: Motor vehicles (1963) 336,300 (automobiles, 220,000); railways (1963), 8,169 miles; merchant vessels (1964), 12 (93,000 gross registered tons); national airline, Czechoslovak Airlines; principal airports, Bratislava, Brno, Kosice, Olomouc, Prague.

Communications: Telephones (1964), 1,298,766; television stations (1964), 18; television sets (1964), 1,700,000; radios (1963), 3,684,000; newspapers (1963), 25 (daily circulation, 3,800,000).

Economic Reforms. The proposed changes reduced central planning and gave factory managers the responsibility for operating their enterprises at a profit. These reforms, called the New Economic Model, were announced on Oct. 17, 1964, and were to be implemented in 1965. The proposed reforms affected almost all aspects of Czechoslovak life.

Government. A reorganization of the government was announced on Nov. 11, 1965. Several ministries were consolidated and new ones were created. The objective of these changes was to free top government officials from an excessive concern with details to allow them to concentrate on broader objectives. The organizational changes were accompanied by changes in personnel. It was generally thought that the purpose of the personnel shifts was to place successful administrators rather than party functionaries in key ministerial positions.

Communist Party. The Communist party has been mobilized to create the proper climate for the widest possible acceptance of the New Economic Model. An intensive propaganda campaign explained the need for change by stressing the desperate position of the Czechoslovak economy. The campaign also warned that the changes would not lessen the influence of the Communist party in leading Czechoslovakia to its goal of a Socialist society.

The 13th Congress of the Czechoslovak Communist party was scheduled to meet on May 31, 1966. Party machinery was set in motion to select delegates and prepare reports to be considered by the congress. On December 22 the Central Committee published a document, which is to serve as a guideline for the congress, condemning the former system of centralized planning in the strongest language ever used.

Education. Eugen Loebl, an economist who is one of the most outspoken advocates of reform and who barely survived the purges of the early 1950's, stated in a number of articles that the successful operation of the New Economic Model depended on the selection of managers on the basis of intellectual ability. This meant replacing those managers chosen primarily for their party loyalty. The search for brainpower had repercussions in the educational system.

Considerable criticism had been expressed that the policy of equalizing wages had in the past destroyed students' incentive to continue with professional education. It was expected that the New Economic Model, by rewarding professional talent, would encourage students to obtain the maximum available education. In July the government decided to establish the Institute of Management. Educational reforms also stressed intellectual qualifications for secondary school entrance.

Cultural Affairs. The emphasis on intellectual attainment encouraged some writers to assert greater independence. In September, 50 young writers organized themselves in opposition to the official Czechoslovak Writers Union. Eduard Goldstücker, a survivor of the 1950 purges, led in the rehabilitation of Karel Čapek, Czechoslovakia's best-known author of the 1920's and 1930's.

The greater degree of freedom manifested itself also in the greater number of Czechoslovaks who were permitted to travel to non-Communist countries. The main obstacle to travel in the West was no longer political restriction, but a shortage of hard currency. Czechs who had emigrated to other countries were urged to visit their homeland.

Foreign Relations. Following a visit by Czech leaders to Moscow in September, a long-term trade agreement was signed with the USSR on Oct. 5, 1965. Soviet party chief Leonid Brezhnev then spent three days in Prague later in October to underline still further Czechoslovakia's close ties with Moscow.

Economy. Gross industrial production rose 4.1% in 1964 over the unsatisfactory performance of the previous year. During the first half of 1965 industrial production rose another 8.7%. Nominal wages and salaries rose 5.1%, while real income climbed 3.8%.

The nation's performance in agriculture continued to be disappointing. An encouraging start of the crop year was negated by one of the worst floods in the history of the Danube River. Crops were ruined in many areas of Slovakia.

ASIA

S. AMERICA

Gen. Christophe Soglo led a bloodless coup in Dahomey on Nov. 29, 1965, that deposed President Sourou Migan Apithy and Vice President-Premier Justin Ahomadegbe. General Soglo appointed Tahirou Congacou, president of the National Assembly, to head a provisional government. The coup followed a power struggle between Apithy and Ahomadegbe over who should appoint a new president of the Supreme Court. On December 22, General Soglo replaced Congacou with himself as head of state because of "the incapacity of the politicians to govern." He suspended the constitution, banned political parties, and dissolved the municipal councils.

Economy. Dahomey's economy was in a critical state in 1965. On June 21, Ahomadegbe, then premier, announced that efforts would be doubled to attract foreign investments to Dahomey. At the same time, government salaries were cut 25% in an attempt to ease the budgetary crisis. It was hoped that the opening of the \$28 million port of Cotonou early in the year and the completion of a \$3 million palm kernel oil mill outside of Cotonou on February 20 would help the country's economy.

Foreign Affairs. The Chinese Nationalist aid mission withdrew from Dahomey on April 10, and the first Chinese Communist ambassador to Dahomey was accredited on June 19. The Chinese Communists were active throughout the year in the political and cultural fields, concentrating primarily on labor organizations, the press, and youth groups. Although no formal agreements were signed regarding

trade and aid, Dahomey and China entered into discussions on both subjects. On March 10, Dahomey and the Soviet Union signed a "plan for cooperative measures."

DAIRY PRODUCTS

Dairy farmers in the United States produced about 125,463,000,000 pounds of milk in 1965, according to preliminary estimates of the U.S. Department of Agriculture. This was about 1% below the record output of 126,598,000,000 pounds which was achieved in 1964.

The output per cow, which has been gaining annually ever since World War II, continued to increase in 1965. The average was estimated at 8,037 pounds, or 2% above the previous high of 7,880 pounds in 1964, and amounting to more than 50% above the 5,314 pounds of 1955. The 1965 increase per cow of 157 pounds was sharply below the 1964 gain of 319 pounds and the 1955-64 average annual increase at about 285 pounds.

The downward trend in the number of milk cows on farms, beginning in 1945, continued in 1965, when the number of cows averaged about 15.5 million, or 3.6% below 1964. The milk cow population has declined 36% during the past 10 years, even though the amount of milk produced has increased.

DAHOMÉY · Information Highlights

Area: 43,483 square miles.
Population: 2,300,000 (July 1, 1964 est.).
Chief Cities: Porto-Novo, the capital (1964 est.), 69,500; Cotonou (1964 municipal census), 109,328.
Government: Chief of State—Gen. Christophe Soglo (assumed power Dec. 22, 1965). *Parliament*—National Assembly, 42 members, all belonging to the Parti Démocratique Dahoméen.
Religious Faiths: Tribal religions, 68% of population; Muslims, 15%; Roman Catholics, 12%; others, 5%.
Education: Total school enrollment (1963-64)—120,050 (primary, 113,600; secondary, 5,400; technical, 1,050).
Finance (1964): Revenues, \$28,900,000; expenditures, \$28,900,000; monetary unit, CFA franc (246.85 CFA francs equal U.S.\$1).
Manufacturing: Lumber (1963), 4,000 cubic meters.
Crops (metric tons, 1963-64 crop year): Cassava, 1,226,000 (ranks 6th among world producers); sweet potatoes and yams, 534,000 (world rank, 10th); palm kernels, 49,300 (world rank, 5th); maize, 206,000; peanuts, 31,000; dry beans, 22,000; cottonseed, 11,000.
Foreign Trade (1964): Exports, \$13,200,000 (chief exports: palm kernels, \$7,100,000; palm oil, \$2,700,000); imports, \$31,400,000 (chief imports, 1963: cotton fabrics, \$4,800,000; motor vehicles, \$2,500,000; iron and steel, \$2,100,000). Chief trading partners (1963): France (took 72% of exports, supplied 62% of imports); Netherlands (took 12% of exports, supplied 1% of imports); Senegal (took 2% of exports, supplied 5% of imports).
Transportation: Roads (1964), 3,828 miles (369 paved); motor vehicles (1964), 8,000 (automobiles, 3,500); railways (1963), 360 miles; principal airport, Cotonou.
Communications: Telephones (1964), 3,129; radios (1962), 35,000; newspapers (1962), 2 (daily circulation, 3,000).

Although milk production in the United States in 1965 decreased about 1,135,000,000 pounds from 1964, farm sales dropped only about 463,000,000 pounds because less milk was consumed on the farms where it was produced. Use of milk in commercial markets increased about 1,700,000,000 pounds. As a result, the Commodity Credit Corporation's purchases for price support were expected to be about 1,250,000,000 pounds less than the 7,700,000,000 pounds bought in 1964, and sharply below the 1962 record purchase of 10,750,000,000 pounds.

Dairy products in commercial and government stocks had dropped about 11% by the end of 1965, to approximately 4,700,000,000 pounds. This total compares with 5,294,000,000 pounds on hand at the end of the previous year, and with 8,488,800,000 pounds as the year-end average for 1960-64.

Civilian use of milk in 1965 was estimated to be about 39,000,000 pounds below the 118,855,000,000

pounds (milk equivalent) consumed in 1964. Use of milk per capita in all forms fell 9 pounds, to 619 pounds. Consumption per person has declined each year since 1955.

World Production. According to preliminary estimates, milk production in 36 countries that normally produce about 85% of the world's supply increased about 2% during 1965. Output in these countries was estimated at 647,423,000,000 pounds, compared with 631,805,000,000 pounds in 1964. The 1965 output was 11% above the 1956-60 average of 580,770,000,000 pounds.

Milk production increased about 3% in western Europe, the area with the highest production. Eastern European production rose about 5% over that of 1964, while South American output increased about 4%. Output in the Western Hemisphere as a whole was down about 1%.

RAY REIMAN
President, Farm Business, Inc.

DALLAS

The second largest city in Texas, Dallas (1965 est. pop., 807,800) began a major construction project in its downtown area in 1965 and agreed to build a joint airport with Ft. Worth. Also, the long-sought canal to connect the city with the Gulf of Mexico won federal approval, and the Dallas public schools adopted a new school integration plan.

New Construction. In 1965, construction began on Main Place, a multi-million-dollar, ten-acre building complex for the Dallas central business district. The first major unit of the privately endowed 1,266-acre Graduate Research Center of the Southwest was dedicated by Gov. John Connally. The \$40,000,000 Dallas County Junior College System, with four campuses planned, was approved by popular vote.

New Transportation Facilities. Dallas and Ft. Worth, following a Civil Aeronautics Board order, ended a 20-year controversy on Sept. 25, 1965, by agreeing to construct a joint regional airport on a 21,000-acre site to be chosen by a neutral professional firm.

The long-sought Trinity River Project, a \$911,-000,000 barge canal, to connect Dallas with the Gulf of Mexico, was included in the Rivers and Harbors Bill enacted by the U.S. House of Representatives on Sept. 22, 1965.

School Integration. On July 2, 1965, the U.S. circuit court of appeals ruled that the stair-step, grade-a-year integration plan in effect in Dallas public schools since 1962 did not meet legal requirements. The Dallas School Board then adopted a plan to integrate elementary grades in 1965, junior high grades in 1966, and senior high grades in 1967. After the plan was approved by the federal district court, Dallas Negro parents appealed to the circuit court in New Orleans, which ordered immediate integration of the 12th grade. The rest of the plan remained unchanged, however.

Ruby Appeal. Efforts to free Jack Ruby, the condemned slayer of Lee Harvey Oswald (who assassinated President Kennedy in Dallas, Nov. 22, 1963), on the grounds that the judge who sentenced Ruby was not qualified, were denied. After its ruling, the district court sent the record of Ruby's trial to the state court of criminal appeals for review.

Economy. Dallas, the seat of Dallas County, is the economic center of a four-county standard metropolitan area of 3,653 square miles (1965 est. pop., 1,336,200). The city leads the South in wholesale trade, and is a major insurance and finance center

and a prominent international spot cotton market. The city's industries include aircraft factories, automobile assemblies and electronics and oil-well equipment plants. Manufacturing accounts for about one fourth of employment in the Dallas metropolitan area, which totaled 524,700 as of Oct. 1, 1965.

City Government and Finance. Dallas has a council-mayor form of government. The mayor is Erik Jonsen, and the city manager is Elgin Crull. Finances for the 1965-66 fiscal year included: city budget, \$92,877,443; school budget, \$60,612,967; net debt: city, \$215,234,000, and schools, \$93,971,100; assessed valuation for tax purposes, \$2,970,701,574; tax rates: city, \$1.70 per \$100 assessed valuation, and schools, \$1.30.

ARTHUR A. SMITH
*Economist and Senior Vice President
First National Bank, Dallas*

DAMS

Serious and prolonged drought over large areas of the United States and a total power blackout that affected an estimated 30 million Americans for up to 12 hours spurred interest in dam construction during 1965. The need for more reservoirs to save as much surface water as possible was obvious. Less obvious, but nevertheless a fact, was the importance of having hydroelectric power plants that can be put back into service easily—unlike steam power plants—after an equipment failure somewhere else on the line shuts down generators.

Oroville Dam. In effect, contractors are building a mountain on the Oroville Dam project on the Feather River north of Sacramento, Calif. Using a wheel excavator to load up to 3,000 cubic yards per hour onto conveyor belts—a rate that enables

YELLOWTAIL DAM across Montana's Bighorn River Canyon was topped out in 1965 as crews finished pouring concrete.

it to fill 42-car railroad trains in 14 minutes—the contractor is piling up earth at top speed for a 770-foot “mountain”—the world’s highest earth-fill. The contractor expects to have the dam well above 500 feet by the end of 1966, and to complete it in 1967.

San Luis Dam. Also in California, the big San Luis earthfill dam was another study in pushbutton earthmoving. Although not a record-setter in height, San Luis Dam has a volume of 78 million cubic yards, which makes it rank fourth in size in the world. A big wheel excavator also loads fill for this embankment, but, instead of a railroad, the contractor uses 100-ton bottom-dump wagons to haul the earth. San Luis is part of a \$511 million joint federal-state project tied into California’s ambitious State Water Project. (See also WATER SUPPLY.)

Yellowtail Dam. The 525-foot-high concrete-arch Yellowtail Dam on the Bighorn River in Montana was topped out during 1965 and first power was to be produced in the spring of 1966, according to its builder, the U.S. Bureau of Reclamation.

Mossyrock Dam. Concrete was scheduled to be poured in 1966 as full-scale construction begins on Mossyrock Dam, a high concrete arch on the Cowlitz River in southwestern Washington. In 1965 the contractor completed excavation inside a cofferdam, going 250 feet below the river bed to reach sound foundation rock. The \$102 million project will be finished in late 1968.

Boundary Dam. Seattle City Light Company diverted the Pend Oreille River around the site of Boundary Dam, a 400-foot concrete arch, in northeastern Washington. Excavation of the underground powerhouse chamber was also completed. At the end of 1965 the \$85 million project was 60% complete.

AKOSOMBO DAM across the Volta River will provide Ghana with abundant electricity for its industrial development.

UPI

WIDE WORLD PHOTOS

SAN LUIS DAM, a key unit of the California Water Project, moved ahead in 1965 with excavation of the foundation.

John Day Lock and Dam. The U.S. Army Corps of Engineers advanced construction to the 61% mark during 1965 on the \$448 million, multipurpose John Day Dam on the Columbia River, on the Oregon-Washington border. One of the biggest construction projects now under way in the United States, the John Day Lock and Dam abounds in superlatives. Its 113-foot lift navigation lock is the world’s highest single-lift lock. Ultimate powerhouse capacity of 2.7 million kilowatts will exceed that of any single U.S. plant. Its 77-mile-long reservoir has made necessary railroad and highway relocations costing more than the overall cost of many large dam projects.

Hells Canyon Dam. Tunnelers completed a 40-foot-diameter rock tunnel through the steep wall of Idaho’s Hells Canyon. The Snake River was diverted through the tunnel during 1965, and excavation was started for the \$70 million, 320-foot-high concrete arch. The dam’s powerhouse will generate 425,000 kw. for the Idaho Power Co.

Libby Dam. Construction was scheduled to begin in 1966 on a 7-mile tunnel to relocate a main-line railroad that must continue to operate through the construction area for the \$352 million, 420-foot-high concrete gravity Libby Dam on the Kootenai River in northwest Montana. Contracts for the dam and other relocation work will be awarded in 1966.

Dworshak Dam. A \$3.7 million diversion tunnel was started in 1965 to relocate Idaho’s Clearwater River temporarily before the start of work on Dworshak Dam, a 693-foot-high concrete gravity dam. Another contract, estimated at \$100 million, will be let in 1966 for the dam itself. The overall project will cost an estimated \$210 million.

Wells Dam. The Douglas County (Wash.) Public Utility District is building the \$202 million Wells Dam on the Columbia River. Although only 185 feet high, the dam is notable for its design in that it incorporates an 820,000-kw. powerhouse, spillway, fish passage facilities, and a switchyard into a single concrete structure, saving an estimated \$15 million.

Canada. The Canadians during 1965 continued to build some of the world’s most spectacular dams. In British Columbia, an earthmoving operation comparable to those at the Oroville and San Luis dams continued during 1966 at the Portage Mountain Dam, situated on the Peace River hundreds of miles

north of Vancouver. The 600-foot-high, 60-million-cubic-yard rockfill dam is impressive in its own right, but a \$77 million underground powerhouse adds to massiveness of the project. The rock cavern will be the world's largest, measuring 690 feet long, 67 feet wide, and 120 feet high. It will house ten 227,000-kw. turbine generators, making this Canada's biggest single hydroelectric plant and among the top ten in the world.

Construction continued on Quebec's huge Manicouagan-Outardes project, deep in the bush country some 500 miles from Montreal. The Quebec Hydroelectric Commission reported that the world's highest multiple-arch dam, Manicouagan 5, is well past the halfway point. The diversion tunnels were closed during 1965 and the dam began impounding 115 million acre-feet of Manicouagan River water. Filling the lake behind the dam will require an estimated eight years, and it will ultimately be the sixth largest man-made lake in the world.

Farther downstream, a hollow buttress dam named Manicouagan 2 first generated power during 1965. Manic 2's power capacity will be 1 million kw.; Manicouagan 5 will have a capacity of 1.3 million kw.

Construction also progressed in 1965 on Duncan and Arrow dams on the upper Columbia River. Both dams, plus a third on Mica Creek, were made possible by the U.S.-Canadian Columbia River Treaty in 1964.

Africa. Akosombo Dam on the Volta River in Ghana generated its first power in 1965 and was dedicated early in 1966. The 370-foot-high rockfill embankment has created the fifth largest reservoir in the world, containing 120 million acre-feet of water and flooding 3,275 square miles. A large block of Akosombo Dam's initial capacity of 512,000 kw. will furnish power for an aluminum smelter due to be completed in 1967.

In the United Arab Republic, the Egyptian-Russian team building the Aswân High Dam across the Nile, 450 miles upstream from Cairo, reached a critical stage in construction late in 1965. The project as a whole was a year ahead of schedule, but construction men still had to handle the essential task of grouting the granular riverbed materials that underlay the 365-foot-high embankment. Grout—a mixture of water, cement, and sometimes clays and silicates—will be pumped into these alluvial deposits as deep as 465 feet below the base of the 2-mile-long embankment. After the 127.3-million-acre-foot reservoir is filled, the grouting will prevent the Nile waters from seeping under the dam—a development that would turn the \$500-million undertaking into a fiasco.

The Sudan expects to complete its big Roseires Dam on the Blue Nile River during 1966. Although its maximum height is only 223 feet, the concrete and earthfill structure stretches 10 miles across the broad valley. Its powerhouse capacity, when turbines are installed in the future, will be 210,000 kw. The project's primary purpose, however, is to store irrigation water for cotton growers.

Asia. Despite an undeclared war between India and Pakistan in August and September 1965, which raged around the site of Mangla Dam in West Pakistan, construction continued on schedule. The contractor diverted the Jhelum River around the site of the \$354 million earth dam and continued placement of the 75 million cubic yards required for the main embankment. During the fighting, a strict blackout made around-the-clock work impossible.

MARTHA SWOPE

RUDOLF NUREYEV AND MARGOT FONTEYN danced the title roles in the British Royal Ballet's *Romeo and Juliet*.

DANCE

For the second successive year, financial matters dominated the developments in dance in 1965. For the first time, the federal government gave economic assistance to a ballet company. Aid from private foundations continued to flow to both classic and modern dance groups.

The Robert Joffrey Ballet represented dance in President Lyndon B. Johnson's one-day Festival of the Arts at the White House on June 14, but there was speculation concerning the extent to which the Federal Aid to the Arts Act, signed by the president on September 29, would assist the dance. The act said only that funds would be made available for a national ballet company.

RUDOLF NUREYEV, the most exciting male dancer since Vaslav Nijinsky in the opinion of many ballet enthusiasts, toured the United States in the spring of 1965 with Britain's Royal Ballet. He and the company appeared in New York City during April and May and then gave performances in Detroit, Chicago, Los Angeles, San Francisco, and other cities.

Rudolf Hametovich Nureyev was born on March 17, 1938, on a train passing Irkutsk, USSR. At 17, he entered the Leningrad Ballet School, which trains dancers for the Leningrad Kirov Ballet. He later joined the Kirov company, and by the time the group set out on a tour of France and Britain in 1961, Nureyev had become its leading male dancer.

On June 17, 1961, as the rest of the Kirov troupe was about to leave Paris for London, Nureyev discovered that he was to be sent back to the USSR. He sought and was granted asylum in France. In 1962 he became the first "permanent guest artist" with the Royal Ballet.

Grants and Awards. On November 15, the National Arts Council came to the aid of the American Ballet Theatre with a grant of \$100,000 for emergency operating expenses, and an additional \$250,000 to assist the company in its nationwide tour. Plans for the tour had been severely curtailed by lack of funds.

Also on the national level, the U.S. Office of Education awarded \$195,074 for a dance study project to the University of Pennsylvania. The specific intention of the grant was to allow Nadia Chilkovsky Nahumck, an associate in the education division of the university's museum, to conduct a two-year project aimed at setting up a graded course of study in dance for secondary schools.

The Ford Foundation, which had made an impressive grant to the New York City Ballet in 1964, announced on Nov. 17, 1965, the gift of another \$3.2 million to the New York City Ballet and the New York City Opera to help expand their operations at the New York State Theater in Lincoln Center.

More modest but in a way more significant was the Aspen Institute for the Humanistic Studies grant of \$30,000. Its purpose is to "honor the individual anywhere in the world judged to have made the greatest contribution to the advancement of the humanities." Martha Graham, the 1965 recipient, promptly announced that she would use the money for new works.

The Rockefeller Foundation allocated a modest \$2,000 to three premieres at the 18th Annual American Dance Festival, August 13-15, at Connecticut College, New London, Conn.

Ballet. Public interest in dance was on the upswing in 1965. A two-part television special called *The Best of the Bolshoi*, presented February 21 and March 14 by WABC-TV in New York, drew more local viewers for its first installment than did a popular sports program. Also, *An Evening With the Royal Ballet*, a film consisting of four of the British ballet company's most lavish productions, played to sold-out movie houses across the United States.

The American Ballet Theatre, in its 25th anniversary season, March 16-April 11, at the New York State Theater, also played to packed houses. Although at the time the company was desperately in need of financial aid (which it later received), it presented six new productions. Five of the new works were by American choreographers—Agnes de Mille (*The Wind in the Mountains* and *The Four Marys*), Jerome Robbins (*Les Noces*), Bentley Stone (*L'Inconnue*), and Glen Tetley (*Sargasso*). The company also danced a stylistically faithful version of the two-act romantic ballet *La Sylphide*, usually associated with the Royal Danish Ballet.

Jerome Robbins' *Les Noces* may prove to be the dance masterpiece of this decade. With music by Igor Stravinsky, the ballet depicts a primitive Russian wedding celebration. It hurls the dancers through patterns of an almost barbaric wildness and rhythmic complexity, then subsides to a final moment of awkward tenderness for the bride and groom, danced by William Glassman and Erin Martin.

The one-year-old Harkness Ballet also premiered works by such American choreographers as Alvin

BERTRAM ROSS AND MARTHA GRAHAM (below) made the Old Testament come to life as the Graham company revived one of Miss Graham's early works, *The Witch of Endor*.

MARTHA SWOPE

MARTHA SWOPE

GEORGE BALANCHINE, in a rare stage appearance, (above), danced with Suzanne Farrell in premiere of his new work, *Don Quixote*.

Ailey, Stuart Hodes, Michael Smuin, Donald Saddler, and Richard Wagner. Several new works were contributed by Harkness Ballet's artistic director George Skibine. The company made its world debut in Europe in the spring. Then, after a summer of study and rehearsal at Watch Hill, R.I., and a brief autumn tour in the United States, it moved officially into its ornate new headquarters in New York City.

Other premieres offered by major ballet companies in 1965 included Lew Christensen's *Life* for the San Francisco Ballet, Joseph Lazzini's *The Miraculous Mandarin* for the Metropolitan Opera Ballet, and George Balanchine's *Don Quixote* for the New York City Ballet. *Life* proved to be a pretentious satire on American customs. *The Miraculous Mandarin*, which handled its macabre theme with flair, was helped by Fern MacLarnon's authoritative performance in the central role. *Don Quixote* revealed Balanchine in a rare and elevating philosophical mood. Although Balanchine himself performed the Knight of the Sad Countenance at the May 27 premiere, the emphasis of the ballet was on Suzanne Farrell, who danced the parts of Dulcinea, the Holy Virgin, and many others.

Foreign companies visiting the United States in 1965 included Britain's Royal Ballet in its spring tour. Despite the company's several grandiose new productions, the greatest excitement was generated by the joint appearances of Margot Fonteyn and Rudolf Nureyev.

The Royal Danish Ballet was in the United States for an autumn tour. Some critics felt that it had deteriorated since its last U.S. tour. While the male dancers—Erik Bruhn, in particular—displayed their accustomed *brío*, the female members of the company, with a few exceptions, seemed too passive. The repertoire, it was felt, lacked daring.

The happiest surprise among foreign imports was Henryk Tomaszewski's Polish Mime Theater, which appeared in New York in January. Although promoted as a theatrical attraction, it proved of intense interest to dance audiences, for its approach was as much choreographic as dramatic.

Modern Dance. For the first time in two years, Martha Graham, the 72-year-old titan of American dance, and her brilliantly trained company were seen on Broadway. In a season lasting from November 2 to November 21, she performed in her new work, *The Witch of Endor*, as well as in several repertory pieces, notably the magnificent *Clytemnestra*. The new work she created for the company alone was the wise and sensuous *Part Real—Part Dream*.

Two of the new works presented at the 1965 American Dance Festival at Connecticut College, José Limón's *My Son, My Enemy* and Paul Draper's *Il Combattimento*, were failures. The third, Lucas Hoving's *Satiana*, enjoyed a modest success.

Broadway Musicals. Broadway dance was dominated by choreographers Lee Theodore, Herbert Ross, and Gillian Lynne. Miss Lynne's contributions to *The Roar of the Greasepaint, the Smell of the Crowd* and *Pickwick* were amiable. Lee Theodore created a murder ballet for *Baker Street* that was almost on a par with Balanchine's *Slaughter on Tenth Avenue*. But her choreography for *Flora, the Red Menace*, unfortunately caught none of the childish intensity of the 1930's. For *On a Clear Day You Can See Forever*, Herbert Ross devised an 18th century English brothel scene that may well survive beyond the play.

DEAFNESS

Increased knowledge of the effects of drugs and new techniques in ear surgery were used to combat deafness more effectively in 1965. On September 23, President Johnson signed a bill that included a \$420,000 appropriation to establish a National Technical Institute for the Deaf. The institute, which probably will be established on a university campus, will train deaf persons for various technical occupations.

Loss of Hearing. A hearing loss in infants and children is often due to improper development of the inner ear and auditory nerve. Some deafness in infants results from their mothers' having German measles (rubella) in the first three months of pregnancy. Other cases of hearing loss in infants may be due to drugs ingested by mothers during pregnancy. The prevention of viral infections and a knowledge of potentially harmful drugs will prevent many cases of so-called congenital deafness.

There is a great need for accurate testing methods to assess the type and degree of hearing loss so that maximum use may be made of the residual hearing of children who have inner ear troubles. Newer methods are being perfected so that hearing tests for infants can be accomplished with precision at an early age, before the child is able to signal that he hears the test sounds.

The use of penicillin and many new antibiotic drugs has effectively controlled serious ear infections that often followed nose and throat infections. Acute mastoiditis now occurs only infrequently, usually in patients who do not get adequate early medical treatment. Many patients develop a condition in which fluid collects in the middle ear and causes a painless but persistent loss of hearing. This fluid must be released to restore hearing, in many cases by inserting a small plastic tube through a tiny opening in the ear drum to maintain proper drainage.

Types of Deafness and Treatment. In sensory-neural deafness (nerve deafness), the cochlea of the inner ear, which contains the auditory nerve endings, does not function normally. In conduction deafness, the middle-ear apparatus (ear drum and tiny bones) is abnormal, and sound waves are not properly transmitted to the inner ear.

Some persons have conduction deafness because an overgrowth of bone in the middle and inner ear prevents the proper movement of the stapes, the tiniest ear bone. In treating these patients, ear surgeons have pioneered in the use of an operating microscope. With this microscope they lift the ear drum from its position, view the tiny bones of the middle ear, and correct the fixation of the stapes so that it moves freely again. Alternatively, the stapes is replaced by a plastic prosthesis to restore hearing, often close to a normal level. After the ear drum is replaced in its normal position, it heals very well.

The same operative approach can be used to repair ear-drum perforations or to correct ear-bone abnormalities that may prevent proper conduction of sounds to the cochlea. Surgical treatment of deafness is progressing so rapidly that many operative procedures have been modified several times. All deafness cannot be cured, but almost all deaf patients can be helped.

University of Illinois College of Medicine

DEATH RATES, U.S.

In 1964 there were 1.8 million registered deaths in the United States, for a crude rate of 940 deaths per 100,000 population. This was the first year since 1961 without widespread outbreaks of influenza. The 1964 death rate, however, was higher than that of any other noninfluenza epidemic year since 1954. In the first six months of 1965, there were 13,000 more deaths than there had been in the first six months of 1964, raising the crude rate from 940 to 970 deaths per 100,000 population.

Variations in Death Rates. Until 1954 the annual death rate decreased measurably. From 1954 to 1964 the rate varied, being higher in the years of influenza epidemics (1958, 1960, 1962, and 1963) and lower in the other years.

From 1963 to 1964, death rates decreased for every age group except that of 15 to 44. The greatest decreases occurred in the oldest and youngest groups, due in part to the high level of mortality at these ages during the serious influenza epidemic in early 1963. From 1962 to 1963, the death rates increased for every age group except that of children between 5 and 14. The increase for adults between the ages of 25 and 44 was especially large.

Infant and Maternal Deaths. The infant mortality rate for 1964 (24.8 deaths per 1,000 live births) was slightly lower than the rate for 1963 (25.2). The 1964 maternal death rate (33.3 per 100,000 live births) was somewhat below the 1963 rate (35.8), and it was markedly below the 1954 rate (52.4).

Leading Causes of Death. Since 1921, heart disease has outranked all others as the leading cause of death, accounting for about 39% of the deaths in 1964. Cancer ranked second, with 16%, and strokes third, with 11%. Influenza and pneumonia dropped from fifth place in 1963 to sixth place in 1964. Other bronchopulmonic diseases ranked tenth, with 69% of the deaths from these causes attributed to emphysema.

LEADING CAUSES OF DEATH IN U.S., 1964¹

Ranking	Cause of death	Number	Rate
	All causes	1,798,051	939.7
1	Heart diseases	699,861	365.8
2	Malignant neoplasms (cancer), including neoplasms of lymphatic and hematopoietic tissues	289,577	151.3
3	Vascular lesions affecting the central nervous system (strokes)	198,209	103.6
4	Accidents	103,843	54.3
	Motor vehicle accidents	46,930	24.5
	Other accidents	56,913	29.7
5	Diseases of early infancy	60,322	31.5
6	Influenza and pneumonia, except pneumonia of newborn	59,451	31.1
7	General arteriosclerosis	37,176	19.4
8	Diabetes mellitus	32,279	16.9
9	Other diseases of circulatory system	25,745	13.5
10	Other bronchopulmonic diseases	23,427	12.2

¹ Data refer only to deaths occurring within the U.S. in 1964, and exclude fetal deaths. Rates per 100,000 population are based on midyear population estimates. Death causes are ranked on the basis of the U.S. Public Health Service list of 60 selected causes of death.

Motor Vehicle Deaths. The death rate for motor vehicle accidents rose for the third successive year. The 1964 rate of 24.5 per 100,000 population was the highest since 1941, when the death rate reached 30.0.

DEFENSE. See NATIONAL DEFENSE.

DE GAULLE, Charles

President of France: b. Lille, France, Nov. 22, 1890.

Although returned to office for a second seven-year term on Dec. 19, 1965, President Charles de Gaulle emerged from the election with his prestige deflated and his political strength dissipated. Expecting a massive personal victory that would crown his half-century of service to the nation, he received only a 44.6% plurality of votes cast in the original December 5 election, necessitating the December 19 runoff in which he won a 55.2% majority. Anticipating a rousing endorsement for his policies that would confirm his vision of France and its role in Europe and beyond, he heard rabid indictments from his opponents and received only modest approval from his supporters. Many observers felt that the final majority vote for de Gaulle reflected the French people's fear of change rather than their affirmation of Gaullism.

De Gaulle's France. The president's campaign for reelection got off to a poor start when, in announcing his candidacy on November 4, he claimed that without him the Fifth Republic would "crumble" and France would be "reduced to confusion more disastrous than she has ever known." His opponents seized upon this statement to drive home their point that France's "elective monarch" had confused himself with France. François Mitterrand, who proved to be the strongest contender, repeatedly attacked de Gaulle's "arbitrary use of personal power." "People ask anxiously," Mitterrand remarked, "What will happen if de Gaulle retires?" and I ask anxiously, "What will happen if he stays in power?" To de Gaulle's claims that he was "a national necessity" and the only alternative to chaos, Mitterrand replied: "Who can pretend that France is nothing without him? No, General de Gaulle, you are wrong. France does not belong to you."

While attacking the alleged lack of democracy in France, the opposition also tried to refute the government's claims of economic achievement and social progress. However, de Gaulle could point with pride to the vast strides made since he returned to power in 1958. Admitting that problems remained, he asked for another term to solve them.

De Gaulle's Europe. The president's concept of the grandeur of France would not tolerate any fetters on French sovereignty. Under de Gaulle's guidance, France virtually withdrew from active participation in the European Economic Community (Common Market) and the North Atlantic Treaty Organization (NATO) in 1965. For these existing efforts toward Western European unity and integrated Atlantic defense, de Gaulle substituted his own grand design—a vague association of cooperating European states "from the Atlantic to the Urals," free of "excessive American domination." Critics charged that de Gaulle was both anti-American and anti-European. (See also EUROPE; FRANCE.)

Background. A soldier in the French Army from 1912, de Gaulle fought in both World Wars, rising to the rank of brigadier general, and led the "Fighting French" after France fell to the Germans in 1940. Between August 1944 and January 1946 he headed the postwar French government, but resigned because of friction with the National Assembly. In June 1958 he came out of retirement to accept a call to the premiership. Following the passage of a new constitution, he was elected president on Dec. 21, 1958.

PRESIDENT DE GAULLE holds one of his rare press conferences on Feb. 4, 1965, in the luxurious Élysée Palace.

DELAWARE

Charles L. Terry, Jr., former chief justice of the state Supreme Court, took office as the new governor of Delaware in January 1965.

Delaware's first redistricted General Assembly since 1897 convened also in January. The preponderance of New Castle County members in the new Assembly was demonstrated by the election of Harold Bockman, a first-term member from the county, as speaker of the House of Representatives.

Tax and Salary Reforms. The Democratic-controlled legislature provided new taxes, including larger auto registration fees and higher taxes for nonresidents employed in Delaware, to help meet a record \$123 million budget. An overdue reform of the magistrate-constable system was enacted to take effect in 1966. The reform provides that justices of the peace and constables will be paid salaries in lieu of fees, and that new justices will be appointed by the governor and new constables will be named by the chief justice.

Mosquito Control. A part of the divestiture funds that came to the state as tax revenue derived from the distribution of General Motors stock among Du Pont shareholders was appropriated to support the first major mosquito-control project in Delaware in

Area: 2,057 square miles.
Population: 494,000 (1965 est.).
Chief Cities (1965 est.): Dover, the capital (12,000); Wilmington (92,500); Newark (13,800); Claymont (12,500); Elsmere (7,300); Milford (5,800); New Castle 4,500; Seaford (4,400).
Government: Chief Officers—governor, Charles L. Terry, Jr. (Democrat); lt. gov., Sherman W. Tribbitt (D); secy. of state, Elisha C. Dukes (D); atty. gen., David P. Buckson (Republican); treas., Belle S. Everett; supt. of pub. instr., Richard P. Gousha; chief justice, Daniel F. Wolcott. **Legislature**—General Assembly (convened Jan. 5, 1965): Senate, 18 members (13 Democrats, 5 Republicans); House of Representatives, 35 members (30 D, 5 R).
Education: School enrollment (1964-65)—public elementary, 59,000 pupils (2,300 teachers); public secondary, 44,750 pupils (2,100 teachers); nonpublic schools, 22,000 pupils (680 teachers); college and university (fall 1964), 12,431 students. **Public school expenditures** (1964-65)—\$52,225,000 (\$536 per pupil); teacher's median salary, \$6,700.
Public Finance (fiscal year 1964): Revenues, \$163,454,000 (motor fuel tax, \$11,793,000; federal funds, \$23,888,000). Expenditures, \$175,996,000 (education, \$70,949,000; health, welfare, and safety, \$15,764,000; highways, \$47,803,000). **State debt**, \$219,802,000 (1964).
Personal Income (1964): \$1,669,000,000; average annual income per person, \$3,460.
Public Assistance (fiscal year 1965): \$6,288,410 to 16,600 recipients (aged, \$873,500; dependent children, \$4,045,600).
Labor Force (employed persons, June 15, 1965): Agricultural, 13,600; nonagricultural (wage and salary earners), 201,700 (33.2% manufacturing, 16.4% trade, 12.3% government). **Unemployed persons** (June 15, 1965)—5,300.
Manufacturing (1963): Value added by manufacture, \$666,245,000 (primary metals, \$19,887,000; nonelectrical machinery, \$11,661,000; fabricated metals, \$24,773,000; food and products, \$56,143,000).
Agriculture (1964): Cash farm income, \$116,871,000 (live-stock, \$82,844,000; crops, \$32,056,000; govt. payments, \$1,971,000). Chief crops (tons)—corn for grain, 218,000; potatoes, 78,600; hay, 57,000; wheat, 23,000; barley, 15,000; rye, 8,800.
Mining (1964): Production value, \$1,742,000 (ranks 50th among the states). Chief minerals (tons)—sand and gravel, 1,282,000; clays, 11,000.
Fisheries (1964): Commercial catch, 33,839,000 pounds (\$684,000). Leading species—menhaden, 32,554,000 pounds (\$378,000); hard blue crabs, 313,000 pounds (\$32,000); clams, 418,000 pounds (\$185,000); shad, 150,000 pounds (\$19,000).
Transportation: Roads (1965), 4,294 miles (4,284 surfaced); motor vehicles (1965), 255,785; railroads (1965), 340 miles; airports (1964), 19.
Communications (1965): Telephones, 265,000; television stations, 1; radio stations, 12; newspapers, 3 (daily circulation, 137,772).

30 years. Ditches, pools, and diked impoundments are to be constructed on 35,000 acres of marsh.

New County Government. A new scheme of government for urbanized New Castle County was adopted by the legislature. Under the scheme, which is close to the recommendation made by a bipartisan gubernatorial committee, a county executive and a county council will be chosen in 1966. The councilmanic districts were drawn by the legislature in accord with senatorial districts. A merit system for county employees was adopted to help provide a measure of continuity in county administration.

Gubernatorial Vetoes. Governor Terry vetoed more measures in 1965 than his predecessor had in four years. Many of the vetoed bills were appropriation measures passed late in the year.

Civil Rights. Three fair-housing laws, designed to reduce racial discrimination in the sale and rental of real estate, were proposed during the legislative session, but failed to pass. Racial discrimination in the schools, however, continued to decline. Several hitherto all-Negro schools were incorporated into what had once been wholly white school districts, with the Negro pupils gradually being reassigned to all-white schools. The Methodist Church, the largest Protestant denomination in Delaware, merged its Peninsula (white) Conference, which includes parts of Maryland and Virginia, with the Delaware (Negro) Conference. A Negro, the Rev. John Shockley, became superintendent of the new integrated conference's largest district, Wilmington.

Economy and Construction. Although 1965 was the driest year in Delaware's history, it was nevertheless a prosperous year. Unemployment was at a record low, and the reported per-capita income for 1964 was the highest among the states.

The building industry featured many garden apartments in the suburbs of Wilmington.

University of Delaware*

DEMOCRATIC PARTY. See POLITICAL PARTIES.

DENMARK

Major events of 1965 in Denmark included the debate in the Folketing (parliament) on the country's economy, and some budgeting solutions to these problems by means of changes in tax policy; the resignation of two outstanding political leaders; and the government's continued efforts to seek peaceful solutions for world problems.

Economy. Government efforts to control inflation led to a meeting of the four major political parties—an unusual event in Danish politics—to discuss proposals for excess profits taxes, an increase in the sales tax, and a shift from direct to indirect tax methods. The parties reached agreement on these

proposals, and the Social Democratic minority government presented the reforms to the Folketing in the fall. As a result of the discussions, two "maverick" members of the Liberal party, maneuvering for entry into the cabinet, were ousted from their party as renegades and, by embarrassing the Social Democrats, lost the chance for cabinet posts.

Economic questions, arising primarily from domestic inflation and a serious imbalance in foreign trade, caused the most concern in Denmark during the year. Loss of foreign exchange reserves resulted in efforts to lessen imports, which showed an increase in consumer items, especially cars and luxury items. The worsening of the Danish foreign trade balance resulted in part from a decline in revenues from agricultural exports, despite increases in the volume of agricultural production in both 1964 and 1965. The gap between imports and exports could be met only through loans.

Other sectors of the economy improved, however. Both private and public building construction set a new record during the first half of 1965. Shipbuilding continued to increase because of the higher demand in the world market. The ceramic and stone industry, the chemical industry, and engineering enterprises proved to be the mainstay of Danish advances in production.

Two years of industrial peace were guaranteed by labor agreements signed in March that gave an increase in wages of about 5%. The only strike of consequence during the year was in the brewing industry.

Denmark had its lowest unemployment rate since

Education: Literacy rate—99% of population. Total school enrollment (1962)—871,198 (primary, 559,679; secondary, 126,141; teacher-training, 161; technical, 155,726; higher, 29,491).
Finance (1965 est.): Revenues, \$1,860,000,000; expenditures, \$1,780,000,000; public debt (1963), \$1,058,000,000; monetary unit, krone (6.90714 kroner equal U.S.\$1).
Gross National Product (1964): \$8,907,000,000.
National Income (1964): \$7,062,000,000; average annual income per person, \$1,496.
Economic Indexes (1964): Industrial production, 160 (1958=100); agricultural production, 118 (1956-57=100); cost of living, 125 (1958=100).
Manufacturing (metric tons): Cement (1964), 2,000,000; processed meat (1963), 826,000; crude steel (1964), 404,400; gasoline (1963), 365,000; sugar (1963), 337,000; wheat flour (1962), 202,000; cheese (1964), 124,000.
Crops (metric tons, 1964): Barley, 3,928,000 (ranks 5th among world producers); sugar beets, 3,130,000 (world rank, 15th); oats, 821,000 (world rank, 10th); rye, 292,000 (world rank, 14th); potatoes, 1,213,000.
Minerals (metric tons, 1964): Diatomite, 20,000 (ranks 8th among world producers); kaolin (1963), 195,000; lime, 160,000.
Foreign Trade (1964): Exports, \$2,119,000,000 (chief exports: manufactured goods, \$793,300,000; bacon, \$226,900,000; butter, \$107,400,000); imports, \$2,614,000,000 (chief imports, 1963: nonelectrical machinery, \$231,000,000; transport equipment, \$174,800,000; petroleum products, \$168,200,000). Chief trading partners (1963): West Germany (took 17% of exports, supplied 21% of imports); Britain (took 23% of exports, supplied 15% of imports); Sweden (took 10% of exports, supplied 12% of imports).
Transportation: Roads (1964), 37,344 miles (31,069 paved); motor vehicles (1964), 822,412 (automobiles, 605,486); railways (1963), 2,030 miles; merchant vessels (1964), 337 (2,335,000 gross registered tons); airline, Scandinavian Airlines System (SAS); principal airport, Copenhagen.
Communications: Telephones (1964), 1,247,958; television stations (1964), 15; television sets (1964), 1,200,000; radios (1963), 1,631,000; newspapers (1963), 71 (daily circulation, 1,598,000).

1910 and, as a consequence, faced a labor shortage in some industries. The rate of production continued to climb, and the country registered an impressive increase in its gross national product.

Resignations of Political Leaders. Denmark lost an outstanding political figure of the postwar era when Erik Eriksen resigned as leader of the Liberal party. A former prime minister, a member of the Resistance during World War II, and a specialist in economic problems, Eriksen was replaced by Poul Hartling.

After concluding the four-party discussions on tax policy and the budget, Poul Hansen of the Social Democratic party resigned as minister of finance because of ill health. He was succeeded by Henry Grünbaum, the minister of economics, whose knowledge of economic affairs substantially aided in the passage of the budget act.

Foreign Policy. The foreign policy debate in the Folketing centered on Denmark's relations with the major powers, chiefly the United States. The government again pledged its support of NATO, but agreed to pursue peaceful solutions to the crisis in Vietnam.

Another foreign policy question concerned tariff reductions in the European Free Trade Association (EFTA). Britain agreed to permit a 5% cut in tariffs instead of the 15% cut proposed earlier. Denmark lost hope that a merger of the EFTA and the European Economic Community could be accomplished.

Anniversary Celebrations. During the spring of 1965, Denmark celebrated two anniversaries. One commemorated the German invasion of Denmark by the Germans in 1940; the other celebrated Denmark's liberation by Allied troops in 1945. In celebrations held throughout the country the Danish people paid homage to their national heroes.

Academic Controversy. Academic leaders heatedly debated the passage of a bill in the Folketing to return to Iceland medieval manuscripts from the Royal Library. Some of the manuscripts were returned to Iceland. The return of others, however, was blocked pending a court decision on the legality of the Folketing bill. The court had not decided on the case by the end of 1965.

DEPARTMENT OF STATE. See FOREIGN POLICY, U.S.; UNITED STATES.

DERMATOLOGY

A steady increase in basic knowledge and rapid multiplication of new treatments characterized dermatology in 1964 and 1965. But old problems that were thought to be conquered have reappeared. For example, the frequency of venereal diseases, especially syphilis, has increased markedly, although they had been well controlled until recently. Dermatologists again are examining the chancres and rashes that are produced by syphilis, especially in young people.

Psoriasis. Steroids such as fluocinonolone acetonide and betamethasone have been found to be effective in psoriasis when incorporated in creams, applied to the lesions, and covered with thin plastic. Systemic therapy with methotrexate is beneficial and fairly safe, according to Eugene Van Scott and his col-

leagues at the National Institutes of Health (NIH).

Steroid drugs are quite effective when they are given on alternate days rather than daily. The alternate-day schedule reduces adrenal gland suppression. These drugs are indispensable, and any method of reducing unwanted side effects is important.

Herpes Zoster. Recent studies by Frank A. Elliot have demonstrated that corticosteroids given by mouth reduce the severity, duration, and morbidity of the disease, as well as the incidence of post-herpetic pain.

Fungus Diseases. Tolnaftate, an original fungicide for local application, became available in 1965. It differs chemically from all its predecessors and is effective and nonirritating.

Mycosis Fungoides. This malignant disease was alleviated by Jane C. Wright and collaborators in nine of 16 patients by the use of antimetabolic drugs. The relief lasted 7½ to 24½ months. X-ray therapy previously had been unsuccessful in treating most of the patients.

Dimethylsulfoxide (DMSO). Investigation by Richard B. Stoughton and William Fritsche has shown that DMSO increases the permeability of the skin to several chemicals. Use of DMSO may solve the inveterate problem of conveying medication applied to the skin to an intracutaneous location. How the chemical works is a mystery, but its remarkable absorption through the skin has fostered high hopes and stimulated research.

Sun Eruptions. A new sunscreen, 2-hydroxy-4-methoxy-benzophenone-5-sulfonic acid (UVAL), was developed in 1965, primarily through the research of John M. Knox. It appears to protect against solar energy of wavelengths that are not screened by competing pharmaceuticals. It is particularly valuable in preventing eruptions caused by wavelengths greater than 2,900 angstrom units, which produce most phototoxic drug eruptions.

Allergy. Reliable tests are not yet available for singling out individuals who might react fatally to penicillin or other medicines. Such a test may evolve from the work of investigators who have observed that the patient's basophilic white blood cells suddenly lose granules when exposed to a drug to which the patient is allergic.

Acne. It has been shown that when blackheads are removed from one side of the face and not from the other, the treated side improves much more rapidly. Richard D. Lowney and collaborators tested the method with 32 patients, and their findings should eliminate controversy over the value of the procedure.

Pigmentary Disorders. Patchy excesses of brown skin pigment are distressing, and they seem to be increasing in incidence. Some birth-control pills can induce hyperpigmentation of the face. Hyperpigmentation of areas exposed to the sun have been found in several patients who took large doses of chlorpromazine over long periods of time. Chlorpromazine may also cause slate-gray skin discoloration resembling argyria, according to Clayton E. Wheeler and collaborators.

DETROIT

Detroit voters reelected Mayor Jerome P. Cavanagh in municipal elections on November 2. During 1965 the face of the city continued to be changed under the stimulus of federal, city, and private spending for urban renewal and other construction projects.

Municipal Elections. On November 2, Mayor Jerome P. Cavanagh was elected to a second term of office, receiving 67.1% of the vote. His opponent was candidate Walter C. Shamie, Detroit publisher and land developer. The city also elected the second Negro councilman in its history—the Rev. Nicholas Hood.

Urban Renewal and Other Construction. Fourteen urban renewal projects, costing a total of \$89 million and designed to attract \$440 million in private investment, were in progress at the end of 1965. The \$10 million Detroit Trade Center, on the western fringe of the downtown area, was nearing completion, and construction was under way on a \$15 million residential project on the east side. The new 25-story, 450-room Hotel Pontchartrain opened in July in the Civic Center.

During the year, city officials began planning a 63-acre research park to be built on the north side of the downtown area, and initiated a 10-year plan for a cultural center adjacent to Wayne State University.

The J.L. Hudson Co., Detroit's leading department store, continued its expansion into the suburbs by opening a branch at Westland, a \$10 million development in Nankin Township.

Storm. The worst storm in 35 years hit the Detroit metropolitan area on February 25 and 26, when 11 inches of snow fell in a 24-hour period. Communications were paralyzed and business came to a standstill. Twenty-seven deaths were attributed to the storm, and losses from property damage were estimated in the millions of dollars.

Grand Jury Investigation. A one-man grand jury investigation of charges of traffic ticket "fixing" by members of the Wayne County Sheriff's Department was started under the direction of Circuit Judge Edward Piggins. The investigation was still under way as the year ended.

Economy. Detroit businesses enjoyed a year of prosperity in 1965. The boom was led by the auto industry, which turned out a record 9,335,182 cars and 1,802,182 trucks.

Detroit's anti-poverty program was put into full effect during the year. A total of 34 projects, costing \$12 million and involving 200,000 central city residents, was underway.

The 1965-66 city budget of \$367.4 million permitted a property tax reduction of \$1.24 for each \$1,000 of assessed valuation.

Schools. Detroit's public schools operated on a budget of \$153.5 million for the 1965-66 school year. A total of 295,000 students were enrolled in the public schools. Federal grants totaling \$20 million were used to implement special programs, including a preschool program for 6,000 underprivileged children.

Population. Population within Detroit's city limits dropped slightly in 1965, to an estimated 1,630,000 persons, according to an estimate of the Detroit Metropolitan Regional Planning Commission. However, the commission reported an increase of 111,000 persons in the four-county metropolitan area—the largest annual increase in the metropolitan population since 1956. The commission estimated that the

metropolitan area has a total population of 4,243,200, as compared with 3,934,800 at the 1960 census.

Suburban Warren, on Detroit's northern boundary, was the fastest growing city in Michigan, adding about 1,000 persons each month.

DISASTERS

The worst disaster of 1965 took place in East Pakistan, where cyclones struck the coast in May and June, exacting a death toll of more than 45,000. Taal Volcano in the Philippines erupted for the first time since 1911, killing 208 persons.

In the United States, hurricane Betsy struck Florida, Louisiana, and Mississippi in September, causing at least 90 deaths and property damage estimated at \$400 million. A series of tornadoes swept the midwestern U.S. in April, killing 242 persons.

Air disasters included the crash of a Pakistani International Airliner in May, in which 119 persons were killed, and the crash of a Chilean airliner in February which killed 87, and the crash of a U.S. Air Force transport jet in June which killed 84 persons.

Noteworthy disasters and accidents of 1965 include the following:

AVIATION

- U.S. Air Force jet crashes in residential section of Wichita, Kans., killing 30 persons, Jan. 16.
- Chilean airliner crashes in Andes, killing all 87 persons aboard—worst air disaster in Chilean history, Feb. 6.
- Eastern Air Lines D-C7 crashes in sea off Long Island, N.Y.; all 84 aboard are killed, Feb. 9.
- Iberia Airlines plane crashes in Strait of Gibraltar, killing 50 of 53 persons aboard, March 31.
- Royal Jordanian Airliner crashes on mountain near Damascus, Syria, killing all 54 persons aboard, Apr. 10.
- British United Airways airliner crashes at Jersey, Channel Islands, killing 26, Apr. 14.
- Iberia Airlines plane crashes at Santa Cruz de Tenerife, Canary Islands; 32 of 49 aboard are killed, May 5.
- Pakistani International Airlines jetliner crashes near Cairo, Egypt, killing 119 of 125 persons aboard, May 20.
- Two army helicopters collide at Fort Benning, Ga., killing 18 persons, June 15.
- U.S. Air Force transport jet crashes into mountain ridge near Los Angeles, Calif., killing 84 persons, June 25.
- British Royal Air Force plane explodes and crashes near Nuneham Curtney, England, killing 41 persons, July 6.
- Canadian Pacific airliner crashes northeast of Vancouver, B.C.; 52 persons aboard are killed, July 8.
- U.S. Air Force radar plane crashes northeast of Nantucket Island, Mass.; 16 crewmen are killed, July 12.
- United Air Lines jet crashes in Lake Michigan north of Chicago, killing all 30 persons aboard, Aug. 16.
- U.S. Marine Corps transport plane crashes into sea at Hong Kong; 58 persons are killed, Aug. 24.
- Pan American jetliner crashes on mountain peak in Montserrat, British West Indies, killing 30 persons, Sept. 17.
- British European Airways plane crashes in fog at London Airport, killing 26, Oct. 27.
- Argentine Air Force plane crashes near Limón, Costa Rica; 68 persons are killed, Nov. 3.
- American Airlines plane crashes into hill near Cincinnati, Ohio, killing 58 persons, Nov. 8.
- Boeing 727 jet crashes while landing at Salt Lake City, Utah, killing 43, Nov. 11.
- Eastern Airlines Constellation and Trans World Airlines 707 collide over Danbury, Conn.; 4 persons are killed, 50 injured, Dec. 4.
- Spanish charter plane crashes at Santa Cruz de Tenerife, Canary Islands, killing 32, Dec. 7.

EARTHQUAKES

- Earthquake strikes central Chile, breaking 230-foot dam in village north of Santiago; 400 persons drowned, March 28.
- Earthquake in El Salvador hits San Salvador and suburbs, killing 100 and taking heavy toll in injuries and damages, May 3.

KILLER TORNADES caused this scene of destruction in the Illinois community of Crystal Lake, where about 100 homes were destroyed. The series of twisters, which struck six midwestern states on April 11, 1965, killed 242 persons.

UPI

FIRES AND EXPLOSIONS

Explosion in coal mine near Lens, France, kills 21 miners, Feb. 2.
 Fire on Madrid-Barcelona mail train near Zaragoza, Spain, kills 25, Feb. 10.
 Coal mine explosion on Hokkaido, Japan, kills 35 miners, Feb. 22.
 Explosion and fire at housing development in Montreal, Que., kills 28 and injures 50, March 1.
 Explosion of natural gas pipeline at Natchitoches, La., kills 17 persons and injures 6, March 4.
 Series of gas explosions in government-owned lignite mine near Amasya, Turkey, kills 68 miners, March 19.
 Explosions at U.S. airbase in Bienhoa, South Vietnam, kill 21 persons, mostly U.S. servicemen, May 16.
 Gas explosion in coal mine in Tonypandy, Wales, kills 31 miners, May 17.
 Coal mine explosion in the State of Bihar, India, kills about 375 miners, May 28.
 Explosion at coal mine in Kyushu, Japan, kills 237 miners, June 1.
 Coal mine explosion near Sarajevo, Yugoslavia, kills 108 miners, June 7.
 Explosion and fire in Titan II missile silo near Searcy, Ark., kills 53 persons, Aug. 9.
 Two explosions at Du Pont synthetic rubber plant at Louisville, Ky., kill 12 persons and injure 37, Aug. 25.
 Gas explosion at National Guard Armory in Keokuk, Iowa, kills 30 persons and injures 30, Nov. 24.

FLOODS

Flash flood in southwest Texas kills 16 persons, June 11.
 Floods in South Korea kill a reported 74 persons, July 18.
 Floods in Chile kill 96 persons and leave 70,000 homeless, Aug. 16.
 Flash flood strikes village of Khem Khemis Nagua, Morocco; 75 persons are killed, Sept. 23.
 Flash floods and heavy rains in southern California cause 11 deaths, Nov. 23.

HURRICANES, TORNADES, AND TYPHOONS

Tornadoes sweep six Midwestern states, killing 242 persons and injuring thousands, Apr. 11.
 Tornado hits 15 Minneapolis suburbs; 13 persons are killed and 400 injured, May 6.
 Cyclone and tidal waves hit coast of East Pakistan, killing more than 45,000 persons, May 11-12 and June 1-2.
 Typhoon hits Japan; 17 persons are killed and 10 are reported missing, May 27.
 Hurricane Betsy hits Florida, New Orleans, lower Louisiana, and Mississippi, killing 90 persons; property damage is estimated at \$400 million, Sept. 7-10.
 Typhoon strikes central and northern Japan; 48 persons are killed and 780 are injured, Sept. 10.
 Typhoon strikes Japan; 93 persons are killed and 28 are reported missing, Sept. 19.
 Coast of East Pakistan is hit by cyclone; 478 persons are killed, Dec. 15.

MARINE

Cruise ship *Yarmouth Castle* burns and sinks in Caribbean Sea, 40 miles off Nassau, Bahamas; 90 of 550 persons aboard die, Nov. 13.

WIDE WORLD

CRASH LANDING of Boeing 727 jet liner at Salt Lake City on Nov. 11, 1965, killed 42 of the 91 persons aboard.

ERUPTION of Taal Volcano in September 1965 buried Volcano Island in the Philippines under hot lava, killing 208.

UPI

UPI

VICTIMS OF EARTHQUAKE which devastated El Cobre Valley, Chile, on March 28 are given a mass burial service.

RAILROADS

Commuter train is derailed near Durban, South Africa, killing 81 persons and injuring 130, Oct. 4.

Train wreck at Villar de los Álamos, Spain, kills 37 persons, Dec. 18.

MISCELLANEOUS

Mine elevator cage falls into 150 feet of water at Real del Monte, Mexico, killing 27 miners, May 8.

Avalanche at Garmisch-Partenkirchen, Germany, kills 10 persons, May 15.

Bus and truck collision near Vinton, La., kills 11 persons and injures 28, Aug. 27.

Avalanche at Saas-Fee, Switzerland, buries machines and workers at a hydroelectrical construction project; at least 11 persons are killed, Aug. 30.

Taal Volcano erupts in the Philippines, killing 208 persons, Sept. 28.

Trolley bus plunges into Nile River at Cairo, Egypt, drowning 74 persons, Nov. 1.

DISTILLING INDUSTRY

The production of distilled spirits at plants in the United States during the fiscal year 1965 increased by more than 26 million tax gallons over the preceding year.

U.S. DISTILLED SPIRITS PRODUCTION

	Fiscal Year, 1965 (Tax gallons) ¹	Fiscal Year, 1964 (Tax gallons) ¹
Whiskey.....	117,930,282	102,731,916
Brandy.....	11,521,724	11,142,801
Rum.....	2,273,811	2,128,832
Gin.....	25,560,827	23,625,545
Vodka.....	12,620,937	10,836,521
Alcohol and spirits:		
190° and over.....	658,640,527	647,818,852
Under 190°.....	36,691,486	40,693,628
Total.....	865,239,594	838,978,095

¹ A tax gallon (proof gallon) is a standard U.S. gallon of 231 cu. in. containing 50% of ethyl alcohol by volume; a wine gallon is a standard U.S. gallon regardless of proof.

Rectified Spirits. In the fiscal year 1965, rectifying plants used 92,029,395 proof gallons (88,223,642 gallons in 1964) of domestic and imported liquors. Production by rectification amounted to 92,923,020 proof gallons (88,032,999 gallons in 1964).

Output for Consumption. In the calendar year 1964 the bottled output of domestic and imported distilled spirits totaled 243,104,932 wine gallons, or an increase of 8.6% over 1963. Whiskey bottled during 1964 amounted to 160,880,515 wine gallons, accounting for 66.2% of total distilled spirits bottled.

The remainder of the bottled output included: gin, 28,962,849 gallons; vodka, 28,130,209; rum (bottled in continental United States and not including rum imported from Puerto Rico), 1,542,547; brandy, 7,574,936; cordials, liqueurs, and similar products, 3,252,486.

Revenues. Revenues accruing to the federal government from distilled spirits during the calendar year 1964 amounted to \$2,742,090,000, an increase of 6.3% over 1963. This amount accounted for 72.6% of federal collection from alcoholic beverages, which totaled \$3,777,247,000. Taxes on beer accounted for 24.0% of the total alcoholic beverage receipts, and those on wine, 3.4%. The federal excise tax on distilled spirits was \$10.50 per proof gallon.

Apparent Consumption. The apparent consumption of distilled spirits in the United States in the calendar year 1964 amounted to 276,046,815 wine gallons, an increase of 6.6% over 1963. The figures are based on actual wholesale and retail sales in the control states, and on tax collections or shipments (in gallons) to wholesalers in the license states.

U.S. DISTILLED SPIRITS WITHDRAWALS

	Fiscal Year, 1965 (Tax gallons)	Fiscal Year, 1964 (Tax gallons)
Tax-paid withdrawals:		
Whiskey, total.....	89,772,997	86,631,029

For vessels and aircraft.....	2,627	3,104
To foreign-trade zones.....	180	3,722
For use of U.S. government.....	799,847	639,098
Alcohol for hospital, scientific, and educational uses.....	3,028,252	3,019,083
Alcohol for medicinal, beverage, and other purposes in Puerto Rico.....	122,606	101,751
Used for denaturation:		
Alcohol.....	580,136,507	538,673,598
Rum.....	1,518,807	1,531,922
Total tax-free withdrawals.....	630,266,986	609,177,362

¹ Included in total whiskey.

Imports and Exports. U.S. dutiable imports of distilled spirits during the calendar year 1964 amounted to 50,733,976 tax gallons, with whiskey comprising 44,455,567 gallons of the total. In 1964, exports of distilled spirits from the United States to foreign destinations (exclusive of military shipments) amounted to 2,129,187 proof gallons.

Distillers' Dried Grains. Production of distillers' dried grains at all distilled spirits plants during the calendar year 1964 consisted of 355,200 tons of dark grains, 22,300 tons of light grains, and 20,100 tons of dried solubles. Total production amounted to 397,600 tons.

DOMINICAN REPUBLIC

At the beginning of 1965, a provisional government of center-right orientation was in office in the Dominican Republic, preparing to hold presidential elections. After a disastrous civil war, the year ended almost as it began, with a center-left provisional government making preparations for elections. But all was not the same. Four months of warfare had resulted in at least 2,000 deaths, inflicted massive economic damage, and left the country tense and divided. Moreover, intervention by United States forces caused an upheaval in U.S.-Latin American relations that would long be felt.

Background to the Revolution. The Dominican rebellion had complex economic, political, and military antecedents. Donald Reid Cabral, an able businessman-politician without much popular following, headed a provisional government that had originated with the military overthrow of the constitutional government of Juan Bosch on Sept. 25, 1963. Aiming at victory in the presidential election planned for September 1965, Reid Cabral had manipulated two strong military figures out of their jobs—the armed forces secretary and the police chief. The prospect of civilian control of the armed forces was eyed askance by other members of the military establishment, especially Col. Pedro Benoit of the air force and Gen. Elias Wessin y Wessin, who was commander of the Center for Armed Forces Training (CEFA) and had played a key role in the overthrow of Bosch.

In addition, Reid apparently intended to refuse readmission to the country of its two most popular figures, ex-Presidents Juan Bosch, head of the Partido Revolucionario Dominicano (PRD) of the democratic left, and Joaquín Balaguer, head of the Partido Reformista (PR) and an enigmatic figure identified both with the late dictator Rafael Trujillo and with the transition from Trujilloism.

Despite Reid's sensible policies, the economy and the government budget were undermined by a deep drop in price of sugar, the country's major product, in 1964. In desperation, Reid cancelled that year's traditional Christmas bonuses for workers, cut payrolls in the sugar industry, and announced his in-

SANTO DOMINGO is patrolled by U.S. soldiers on May 5, soon after the United States intervened in the Dominican civil war to prevent a possible Communist takeover.

tention of reducing the military budget and eliminating a military smuggling racket.

The complexity of the succeeding revolutionary and counterrevolutionary events reflects the fact that a wide range of military and civilian groups, of all political persuasions, opposed the Reid government for imposing these and other measures.

DOMINICAN REPUBLIC

Area: 18,704 square miles.
Population: 3,573,000 (July 1, 1965 est.).
Chief Cities (1965 est.): Santo Domingo, the capital, 435,155; Santiago, 99,020; San Francisco de Macoris, 30,824; La Romana, 28,521.
Head of Government: Provisional President—Héctor García Godoy (took office Sept. 3, 1965).
Religious Faiths: Roman Catholics, 96% of population; Protestants, 1%.
Education: Literacy rate (1964)—35% of population. Total school enrollment (1962)—550,443 (primary, 479,084; secondary, 40,419; teacher-training, 346; technical, 25,272; higher, 5,322).
Finance (1965 est.): Revenues, \$179,934,000; expenditures, \$179,934,000; monetary unit, peso (1 peso equals U.S.\$1).

Information Highlights

Gross National Product (1963): \$784,000,000.
National Income (1963): \$628,000,000; average annual income per person, \$188.
Cost of Living (1964): 112 (1958=100).
Manufacturing (metric tons): Sugar (1964), 880,000; cement (1963), 229,000; meat (1962), 28,000; cheese (1961), 1,000; cotton yarn (1962), 100; beer (1963), 285,600 hectoliters; lumber (1962), 55,000 cubic meters.
Crops (metric tons): Cocoa beans (1964-65 crop year), 40,000 (ranks 6th among world producers); cassava (1962-63), 148,000; rice (1963-64), 144,000; maize (1962-63), 104,000; sweet potatoes and yams (1962-63), 76,000; peanuts (1963-64), 52,000; coffee (1964-65), 31,500; citrus fruit (1964-65), 29,000.
Minerals (metric tons, 1964): Bauxite (exported to U.S.), 650,000 (ranks 12th among world producers); salt, 33,000; gypsum, 30,000; lime (1962), 7,300; iron ore (1960), 123,000; gold (exported to U.S., 1960), 308 troy ounces.
Foreign Trade (1964): Exports, \$179,900,000 (chief exports: sugar, \$92,700,000; coffee, \$30,200,000; cacao, \$16,100,000; tobacco, \$15,000,000); imports, \$220,000,000 (chief imports, 1962: cotton piece goods, \$11,650,000; chemical and pharmaceutical products, \$10,400,000; motor vehicles, \$6,230,000; fuel oil, \$3,900,000). Chief trading partners (1963): United States (took 77% of exports, supplied 61% of imports); Canada (took 3% of exports, supplied 7% of imports).
Transportation: Roads (1964), 5,794 miles (2,645 paved); motor vehicles (1964), 24,500 (automobiles, 14,000); railways (1963), 137 miles; merchant vessels (1964), 5 (13,000 gross registered tons); airlines (1964), 4 international; principal airport, Santo Domingo.
Communications: Telephones (1964): 27,514; television stations (1964), 4; television sets (1964), 35,000; radios (1961), 150,000; newspapers (1962), 5 (daily circulation, 86,000).

CAPTURED REBELS (above), stripped of shoes, are guarded by U.S. troops in Santo Domingo.

EVACUEES from the Dominican Republic (left) come ashore at San Juan, Puerto Rico, on April 28.

Outbreak of Civil War. The revolt began on the morning of April 24, 1965, when the army chief of staff, Gen. Marcos Rivera Cuesta, after arresting three leading anti-Reid conspirators, including Colonel Benoit, was himself arrested by their supporters. That afternoon, the rebels seized a radio station long enough to broadcast that the Reid government had been overthrown. At this point, the various antigovernment groups were held together by a loose formula under which a new military junta would be formed to hold elections in which both Bosch and Balaguer would be permitted to run. However, the younger pro-Bosch conspirators, who still regarded Bosch as the legal president, suspected that the generals who had overthrown Bosch would not allow him to return to power.

Operating on this premise, the pro-Bosch group demanded the return of Bosch from exile in Puerto Rico and the restoration of the constitution of 1963. Pending these developments, they established a "constitutional" rebel government headed by Chamber of Deputies President Rafael Molina Ureña, who, during the Bosch era, had been next in line for the presidency under the terms of the constitution.

Confusion reigned as civilians armed by some of the rebel elements took bloody revenge, especially against the hated police. Then, on April 25 and 26, the bulk of the regular military forces, led by General Wessín, attacked Santo Domingo from CEFA headquarters at the nearby San Isidro air base, ad-

vancing with tanks and strafing from the air. Defeat seemed imminent for the "constitutionalist" cause, and many of its leading figures, including Molina Ureña, took refuge in foreign embassies.

On April 28, Wessín named a governing junta of three officers headed by Colonel Benoit. But the "constitutionalist" forces revived when support came from the overwhelming majority of the population. Juan Bosch did not return from Puerto Rico during this period, but he kept in close contact by telephone with the "constitutionalist" rebel leaders, who followed his instructions. The remaining members of the old congress then elected Col. Francisco Caamaño Deñó, the ranking military officer in the rebel camp, as "provisional president."

Caamaño's adherence to the rebel cause was typical of the strange political realignments brought about by the revolution; he formerly had been chief of the feared white-helmeted riot squad. A leading member of his staff belonged to the center-right *Partido Liberal Evolucionista* (PLE), and another belonged to Bosch's PRD. Also in the rebel camp was the bulk of the Revolutionary Social Christian party, of the Catholic left, and three far-left parties. These were the Popular Socialists (later the Dominican Communist party), which was Moscow-oriented and the most moderate of the three; the *Movimiento Popular Dominicano*, a Peking-oriented revolutionary group; and the Castroite 14th of June Movement, the largest and most influential.

UPI

JUAN BOSCH, former president of the Dominican Republic, returned to Santo Domingo from exile in Puerto Rico on Sept. 25, 1965, the second anniversary of the military coup that ended his administration. His dramatic homecoming came after a four-month civil war between his supporters and those of the governing junta. Although he had been deposed because of his alleged Communist sympathies, Bosch has described himself as a spokesman for the anti-Communist democratic left. He is expected to be a presidential candidate in 1966.

Bosch was born in La Vega on June 30, 1909. An opponent of the Dominican dictator, Rafael Trujillo, he left the country in 1937 and spent 24 years in Cuba and elsewhere in Latin America. While in exile, he helped found the Dominican Revolutionary party. After Trujillo's assassination on May 30, 1961, Bosch returned to the Dominican Republic and built up his party. He was elected president on Dec. 20, 1962, in the country's first free elections in 38 years. A writer and scholar, Bosch is also known for his works of fiction and biography.

REBEL LEADER Caamaño signs the act of reconciliation ending the civil war on August 31.

U.S. and OAS Intervention. Fearing that the far left would turn the Dominican Republic into "another Cuba" if the Wessin forces were allowed to collapse, U.S. Ambassador W. Tapley Bennett, Jr., requested U.S. military intervention. On April 28, 405 U.S. Marines landed in Santo Domingo—the first contingent of a force that eventually totaled over 20,000 troops. The early U.S. action aided the Wessin forces, and its effect was to prevent the victory of the "constitutionalists." The original reason given for the intervention—that it was necessary to safeguard American lives—was ironic in that no American lives were lost before the intervention, but that some Americans were killed after it.

Meanwhile, the U.S. Central Intelligence Agency (CIA) compiled a list of 58 alleged Communists active in the rebel camp. The list proved to be inaccurate in many respects. However, in view of the fact that most of the civilian population of central Santo Domingo supported the rebels, there were presumably more than 58 Communists among the tens of thousands of non-Communists on the rebel side.

U.S. officials were instrumental in the creation of a new military junta on May 7. This junta, called the Government of National Reconstruction, was headed by Gen. Antonio Imbert Barreras, who was one of the group that had assassinated Trujillo, but was also regarded as a ruthless former accomplice of the Trujillo regime and, more recently, as an opportunistic collaborator with the far left.

On May 6, prior to the creation of the Imbert junta, the Organization of American States (OAS) approved a U.S. proposal for the creation of an Inter-American Peace Force. Subsequently, the U.S. forces in the Dominican Republic were joined by contingents from Paraguay, Nicaragua, Honduras, and Brazil.

The Inter-American force, officially constituted on May 24 under a Brazilian commander, established an international zone in Santo Domingo that separated the opposing sides. Several temporary cease-fires had reduced (but not ended) the fighting, and the situation settled into a stalemate while representatives of the United States, the OAS, the UN, and the Vatican sought a negotiated settlement. Meanwhile, forces of the Imbert government carried out political reprisals, torturing and killing suspected opponents.

Negotiations. The United States, which came under considerable criticism for the role it had played thus far, changed its policy to that of searching for a generally acceptable center-left moderate to head a transitional government that would reunite the country and restore constitutional processes. Various U.S. negotiators, including at one point presidential assistant McGeorge Bundy, took part.

On June 4, negotiations were taken over by a three-man team of OAS ambassadors from Brazil, El Salvador, and the United States (Ellsworth Bunker). The person found most acceptable as the

HÉCTOR GARCÍA-GODOY was sworn in as provisional president of the Dominican Republic on Sept. 3, 1965, after warring factions in the Dominican rebellion signed a reconciliation act sponsored by the Organization of American States. An experienced diplomat and businessman, García-Godoy was faced with the need to heal the deep animosities and to repair the damaged economy resulting from the civil war. The new president, who had served under the Dominican dictator Rafael Trujillo and President Juan Bosch, describes himself as a "middle-of-the-roader with a very broad middle."

García-Godoy was born in Moca on July 11, 1921. He went to school in Washington, D.C., where his father was in the Dominican embassy, but returned to the Dominican Republic to take a law degree at the University of Santo Domingo in 1944. He successfully pursued careers in both business and government service, becoming vice governor of the Dominican Central Bank (1955), ambassador to Belgium (1958), and foreign minister in Bosch's cabinet (1963).

WIDE WORLD

transitional leader was Héctor García-Godoy, a diplomat who had served in every recent government except Reid's. The agreement ending the conflict provided for presidential elections, later scheduled for June 1, 1966, in which García-Godoy could not be a candidate.

In the maneuvering preceding the final agreement, Imbert was brought to heel by the cutting off of U.S. funds that had been paying the salaries of his government's employees. The Caamaño "constitutionalists" were shown the weakness of their position when inter-American troops made a successful foray into their territory, ostensibly to clear out snipers. As a result, the Imbert and Caamaño forces did not contest the "act of reconciliation" concluded on August 31.

The New Government. García-Godoy, administering the oath himself, was sworn in as provisional president on September 3. Hardly had he been inaugurated when rightist groups and military forces became restive over his moves to reduce the power and expense of the armed forces and over the presence in his government of two former leaders of the "constitutionalist" forces. The United States backed García-Godoy by forcibly escorting General Wessin to exile in Miami, Fla.

The tense situation was complicated by the return to the island, on September 25, of an embittered Juan Bosch. (Balaguer had returned on June 28.) Bosch was wildly cheered when he demanded that the United States pay a \$1 billion indemnity and, with other intervening nations, be brought before the International Court of Justice on charges of violating Dominican sovereignty.

Bombings, attempted coups, sniper shootings, and murders of prominent left- and right-wing figures continued. The Inter-American Peace Force remained to keep order, while the provisional government, with U.S. aid, struggled to rebuild the economy.

On December 19, 28 Dominicans were killed in Santiago de los Caballeros in a clash between government troops and soldiers of the former rebel movement. Early in 1966 another crisis stopped just short of becoming a coup d'état. On January 6, President García-Godoy ordered 34 officers from the regular armed forces and the ex-rebels to diplomatic posts abroad. The armed forces seized the government radio station and began broadcasting accusations that the president was arranging a Communist takeover. They were forced to capitulate, however, under pressure from the Inter-American Peace Force.

DRAMA. See THEATER.

DRUG TRAFFIC. See NARCOTICS.

DRUGS

In 1965, all phases of the drug industry in the United States—retailing, manufacturing, and research—kept abreast with the ever-increasing health demands and needs of an expanding population. At the same time, governmental interest in the manufacture, distribution, and consumption of drugs led to the introduction of legislation and the passage of laws important to the drug industry.

Sales and Economic Growth. The nation's pharmacies dispensed medications for a record-breaking 820 million prescription orders during 1964. The average prescription charge was \$3.42, an increase

of 7 cents from the 1963 charge. Sales by the 54,000 pharmacies in the United States totaled about \$10 billion, including \$6.3 billion for drugs and health-related products.

Worldwide ethical pharmaceutical sales by U.S. firms in 1964 increased 7% over 1963, and totaled \$3.7 billion, on which ethical pharmaceutical manufacturers paid a record \$505 million in taxes. During the year, the industry employed 189,000 persons, of whom about 117,000 worked in the United States. The typical U.S. firm had an average capital investment of \$45,200 for every drug production employee.

In 1964, new trade-named pharmaceuticals numbered 463, compared with 576 in 1963. Seventeen of the pharmaceuticals introduced in 1964 were new single chemical entities.

Drug Legislation. In 1965 the U.S. Congress passed the so-called Medicare bill. This legislation provides for hospital and nursing-home care for the aged and authorizes state welfare drug programs. (See MEDICARE.) Congress also passed the Drug Abuse Control Amendments, which established special controls for depressant and stimulant drugs (see NARCOTICS), and the Health Professions Educational Assistance Amendments, which included construction aid for pharmacy schools and loans and scholarships for pharmacy students. In another move, Congress honored Dr. Jonas Salk and The National Foundation with a resolution on the 10th anniversary of the discovery of the Salk anti-polio vaccine.

The issuance of drug patents was the subject of several legislative proposals. Other proposed measures dealt with officially changing weights and measures from the present American (English) system to the metric system, the standard now used by most major U.S. drug manufacturers. Legislation also was proposed to control possible patient exploitation and physician profits: whenever physicians dispense drugs or own pharmacies.

Food and Drug Administration. In 1965 the Food and Drug Administration (FDA) ordered that inhalers containing methamphetamine could be issued only by prescription. The FDA set similar requirements for preparations containing potassium salts or having more than 400 USP (United States Pharmacopoeia) units of Vitamin D per dosage unit. The FDA also ordered several important drug labeling changes.

The World Health Organization in Geneva adopted a resolution to study the automatic data-processing facilities of the FDA to determine whether the FDA facilities can be used on a worldwide basis to warn about adverse drug reactions.

American Pharmaceutical Association. More than 3,000 persons participated in the professional, educational, and scientific programs at the annual meeting of the American Pharmaceutical Association (APhA), held in Detroit from March 28 to April 2, 1965. At the conference, Vice-President Hubert H. Humphrey, a pharmacist, received the Hugo H. Schaefer Medal "for outstanding leadership and service to the profession of pharmacy." K.K. Chen, a physician and pharmacist who introduced ephedrine into modern Occidental medicine, was the 1965 APhA Remington Honor Medalist.

A ribbon-cutting ceremony introduced the APhA Pharmaceutical Center to the delegates. (See also MEDICINE.)

EARTHQUAKES

Earthquakes occurred in widely separated regions during 1965. The most damaging quake of the year killed 400 persons in Chile. In the United States, earthquakes hit the Seattle and Aleutian Islands areas. Work continued on efforts to predict the occurrence of earthquakes.

Chile. The quake in Chile occurred on March 28. In addition to killing 400 persons, this quake, which had a magnitude of 7.75 on the Richter scale, caused extensive property damage in the central part of the country. The epicenter was at 32.4°S, 71.2°W, off the coast of central Chile.

Chile also was shaken by a shock of magnitude 7.0 on February 23. Its epicenter was at 25.7°S, 70.5°W. The quake caused heavy damage in northern Chile, but only one person was killed.

United States. Seattle was struck by a quake of magnitude 7.0 on April 29. The quake was centered in Puget Sound about 15 miles south of the city. Two persons were killed, and there was moderate property damage in the area. The quake was felt throughout Oregon, Idaho, Montana, and British Columbia.

Many visitors at the New York World's Fair watched a chart recorder while the quake was occurring. The recorder was connected to one of the seismometers in the Fordham University seismic vault.

A quake of magnitude 8.0 struck the Aleutian Islands on February 4. The chief damage was done by the tsunami, or sea wave, generated by the quake. A 35-foot wave struck part of Shemya Island, but the damage to the U.S. Air Force station there was slight. In the first 24 days after the quake, 750 aftershocks were recorded, and 21 of them had a magnitude of about 6.0.

Greece. Several shocks struck the Aegean Sea region in March and April. A shock on March 9 killed two persons and caused heavy damage on Alonissos Island. A seismic sea wave hit Pelagos and Skiathos Islands. A shock on March 31 killed three persons and caused extensive damage in Patras and Agrinion. This shock, which had a magnitude of 6.75, was felt in southern Italy. The most destructive shock, although only of magnitude 5.5, killed 19 persons and destroyed 2,000 homes in central Peloponnesus on April 5. This shock was centered at 37.7°N, 21.8°E. Greece was hit again by a quake on June 6. This quake had a magnitude of 6.0 and was centered at 38.7°N, 22.6°E. Only one person was killed, but there was considerable property damage in northern Peloponnesus.

El Salvador. On May 3 a destructive quake of magnitude 6.25 struck El Salvador; the epicenter was at 13.5°N, 89.3°W. At least 100 persons were killed, 500 were injured, and 7,000 were made homeless. A UNESCO reconnaissance mission was sent to the scene at once. The group brought back valuable information that will aid its efforts to lessen damage in seismic areas. The UNESCO group found that the vibrations had been building up since early February, when about 600 minor shocks were recorded daily. Most modern buildings withstood the shock, but buildings on less solid soil were damaged.

Other Countries. A series of shocks hit Algeria on January 1. The epicenter of the main shock was at 35.7°N, 4.4°E. Although the magnitude of the quake was only 5.5, four persons were killed and 40 were injured, and there was extensive property damage at M'Sila.

EARTHQUAKE shook Greece on April 5, killing 19 persons and shattering 2,000 homes, including this one in Arcadia.

A much larger quake of magnitude 7.5 occurred in Indonesia on January 24; the epicenter of the quake was at 2.4°S, 126.0°E. At least 40 persons were killed on Sanana Island, and there was extensive damage. A subsequent sea wave destroyed 90% of the town of Sanana and caused minor damage on Buru Island.

A quake hit Oaxaca, Mexico, on August 23. One person was killed in Oaxaca, and five were killed in Mexico City. This quake, which had a magnitude of 7.5, was felt throughout southern Mexico.

Seismic Research. The U.S. government continues to be the most generous supporter of seismic research. During 1965, \$137,000,000 was allocated for a program to increase man's ability to predict the occurrence of earthquakes. There is as yet little hope of any general prediction of earthquakes, but progress is being made. For example, the Puget Sound quake of April 29 was better understood because modern seismic equipment had been installed in Seattle in 1949. The equipment records gave a much clearer picture of the seismicity of the region. Within a year after installation, 77 earthquakes were recorded in the Seattle region.

This pinpointing of the focal points of developing strain in seismic regions will greatly help the effort to obtain a partial prediction of earthquakes.

ECONOMIC AND SOCIAL COUNCIL (UN). See UNITED NATIONS.

ECONOMIC REVIEW, U.S.

The United States economy registered strong gains in 1965, continuing the unprecedented upsurge that began nearly five years earlier. As the year ended, business expansion passed its 58th month, and indicators of economic performance stood at or near new highs. (On December 5, the Federal Reserve Board acted to "tighten" the flow of money by raising the loan discount rate to member banks from 4% to 4½%—a move that the board said was designed "to

A. DEVANEY

reinforce efforts to maintain price stability and thus to foster balance in the economy's growth.") A tone of confidence prevailed during most of 1965, and the general feeling was that the favorable business climate would continue into 1966. Scattered problems remained in the economy, including geographic and racial pockets of poverty, but these were receiving continuing attention.

Lower taxes, easy credit, a steelmaking boom, and defense spending added impetus to the economy. In 1965 the second installment of the income tax rate reduction (passed in 1964) added to the disposable income of consumers and business, as did a reduction in a variety of excise taxes. Governmental monetary policy continued to make credit readily available, and to encourage consumer borrowing and business capital expansion.

Postponement of a steel strike deadline from April 1 to September 1 pushed up steel production throughout the summer. During this period, steel inventories were expanded in anticipation of a strike that never came. In addition, the acceleration of U.S. military activities in Vietnam stepped up defense spending.

Measuring the Economy. During the year the U.S. Department of Commerce made a basic revision of the national income and product accounts, going back on an annual basis to 1929 to apply new information and statistical techniques. One result was to show the current boom to be even stronger than had been thought. On the revised basis, the 1964 gross national product (GNP), or total output of goods and services, rounded out at \$629 billion, up 6.8% from the revised level of the preceding year. The GNP for 1965 exceeded the \$670 billion level, gaining about \$10 billion in each quarter for an overall rise of more than 6.5%—again indicating the strong growth rate of the economy.

Not all sectors of the economy, however, advanced upward smoothly and steadily. As measured by the Federal Reserve Board's industrial production index (1957-59 = 100), industrial output increased irregularly from 138 in December 1964 to 144 in July and August. In September, after a steel contract settlement removed the pressure on steel purchasers to accumulate inventory, the index dropped off a point to 143, where it floundered temporarily. But as the excess steel stocks were worked off, the

index started back up, and the industrial sector as a whole expanded its output.

Steel and Automobile Industries. Even with its irregular performance, steel approached a production record in 1965. Heavy production schedules over the first three quarters pushed output well ahead of the comparable period in 1964, and despite the fourth-quarter drop, the year's output ran impressively high.

The automobile industry performed at a record-production pace in 1965. Assemblies of passenger cars totaled about 9.3 million new units—an all-time high that easily exceeded the 1955 record by 1.4 million units. The high level of demand continued as the 1966 models received an enthusiastic reception when introduced on the market in the fall, and the industry felt that another 9-million-unit production year lay ahead in 1966.

Inventories and Income. Manufacturers' sales ran at high levels throughout the year, and, except for the steel buildup prior to contract settlement, inventories were kept well under control. The ratio of inventories to sales remained at levels that have been customary in the past few years and that generally are regarded as conservative. Retail sales rose steadily except for a slight dip in the third quarter, when the pace in automobile sales became unsustainable. Retailers ended the year with the highest level of Christmas-season sales in history.

Consumers' ebullience was fortified by rising personal income, which pushed on to successive records most months of the year. Increased monthly Social Security benefits, as well as a large retroactive payment, helped lift consumer spending in the latter part of the year.

Corporate profits, both before and after taxes, surged to record levels in 1965 as a result of strong demand and high sales volume. After-tax profits were particularly impressive, reflecting favorable reductions in income tax rates, and pushed the stock market averages to new highs in May, November, and December. As the year wore on, however, questions arose increasingly as to the nation's economic ability to continue to boost profits. Productivity increases were threatened by stepped-up reliance on marginal plants and by the incipient scarcity of labor skills. But the high level of profits added to business confidence, and business capital spending showed further gains, rising to a record \$50.9 billion for the year—a gain of 13% over 1964. This strong increase provided a major stimulant to the overall performance of the economy. Other economic developments included a favorable year for the agricultural sector of the economy as a whole.

Trouble Spots. Some problems, however, appeared in the economy. Residential nonfarm construction proved to be a lackluster performer, and showed little or no improvement in volume over 1964. The U.S. balance-of-payments problem persisted, even though it improved in the first half of the year. The first balance-of-payments surplus since 1957 was registered in the second quarter of 1965. It was generally expected, however, that deterioration in the latter half would produce another deficit, and that the year as a whole would show that the problem has not yet been solved.

Employment advanced to a record high, and the unemployment rate declined significantly. By the middle of December 1965, the unemployment rate had dropped from 5% (seasonally adjusted) at the end of 1964 to 4.1% of the labor force—the lowest level achieved in nine years. Some observers pointed

VICTOR KELLEY: PIX

out that this residue includes people waiting between jobs, workers without necessary skills, and others unemployable for a variety of reasons.

On the positive side of the employment picture, the ability of the economy to absorb the increasing numbers of workers entering the labor force represented an achievement in itself. This development dispelled some of the gloom arising from the rapid advance of automation. It has become increasingly obvious that adequate training and development of the proper kind of skills will provide an individual with a place in the economic scene.

Outlook. Coming as it did after nearly four years of rising business trends, the record-setting economic performance of 1965 created much optimism. Earlier, as the upsurge approached post-World War II records in the length of time it has continued,

UPI

many observers felt that a downturn would come at any time. This feeling eased in 1965, and attention turned to more basic factors. The most optimistic observers believed that the U.S. economy had entered a new era, that business cycles can be controlled, and that the upgrading of living standards for all can now be undertaken. Because of the great length of the prosperity, some observers even felt that the U.S. economy had achieved a basic stability and a growth pattern that represent just about the maximum degree of success regarded as obtainable by most of the world's economists.

More pessimistic observers pointed to persistent unsolved problems. They noted that the balance-of-payments problem, rising wage levels, continued use of easy credit, and the pushing of production to capacity levels could lead to steps to choke off the growth or to inflation itself. The middle position seemed to be that 1965 could be documented statistically as an excellent year, and that the favorable trends were likely to continue into 1966. ECUADOR

Ecuador's four-man military junta, in power since 1963, weathered a political crisis in 1965. Violent reaction to the junta's delays in turning over its authority to an elected government forced a cabinet change in July. A member of the junta, Air Force Col. Guillermo Freile Posso, was arrested for "his disloyalty in engaging in personal political adventures."

The country's generally stable economy was threatened by the loss of some foreign markets for bananas, Ecuador's major export crop.

Political Crisis. The junta's reluctance to transfer authority to an elected civilian government caused the country's numerous opposition factions to unite in protest in July. Rioting and terrorist activity broke out in Quito and Guayaquil, but the army and police put down the disturbances. Guayaquil was placed under martial law, and scores of opposition leaders, including former President Camilio Ponce Enriquez, were arrested.

Ecuador's nine-man cabinet, dominated by military officers, resigned on July 17 to allow the junta to name a new, predominantly civilian cabinet. The government, however, refused to comply with opposition demands to reschedule the presidential election planned for July 1966.

Colonel Freile Posso was placed under arrest on November 29. He allegedly had attempted to appoint his military aides to important government posts, and the move was interpreted by other members of the junta as being contrary to their policy of preparing the country for civilian rule.

Economy. A continuing decrease in Ecuador's banana exports since 1964 troubled the nation's economy. In addition, as a result of an anticipated

Religious Faiths: Roman Catholics, 94% of population; others, 6%.

Education: Literacy rate (1962)—67% of the population aged 15 and over. Total school enrollment (1962)—751,898 (primary, 654,278; secondary, 49,164; teacher-training, 9,458; technical, 27,963; higher, 11,035).

Finance (1964 est.): Revenues, \$106,000,000; expenditures, \$148,000,000; public debt (1963), \$156,000,000; monetary unit, sucre (18.18 sucres equal U.S.\$1).

Gross National Product (1964): \$1,021,000,000.

National Income (1964): \$866,000,000; average annual income per person, \$177.

Economic Index: Cost of living (1964), 120 (1958=100).

Manufacturing (metric tons): Cement (1964), 288,000; sugar (1964), 226,000; gasoline (1963), 215,000; wheat flour (1960), 51,000; cotton yarn (1962), 500; wool yarn (1962), 100; lumber (1963), 343,000 cubic meters.

Crops (metric tons, 1964-65 crop year): Bananas (1963-64), 3,300,000 (ranks 2nd among world producers); citrus fruits, 182,000 (world rank, 17th); coffee, 48,000 (world rank, 16th); cocoa beans, 39,000 (world rank, 7th); cassava (1963-64), 189,000; rice, 167,000; maize, 124,000; barley, 81,000; onions (1963-64), 83,000; cottonseed (1963-64), 9,000; lentils (1963-64), 3,000.

Minerals (metric tons, 1964): Crude petroleum, 2,796,000 barrels; salt, 35,000; kaolin, 207; copper, 184; lead, 139; silver, 117,126 troy ounces; gold, 16,905 troy ounces; zinc concentrates (1963), 358; sulfur (1963), 203.

Foreign Trade (1964): Exports \$147,800,000 (chief exports: bananas, \$84,200,000; coffee, \$21,700,000; cacao, \$15,400,000; rice, \$1,100,000); imports, \$147,900,000 (chief imports, 1962: machinery and transport equipment, \$29,686,000; manufactured goods, \$24,348,000; chemicals, \$13,208,000). Chief trading partners (1963): U.S. (took 56% of exports, supplied 47% of imports); West Germany (took 11% of exports, supplied 11% of imports); Japan (took 11% of exports, supplied 4% of imports).

Transportation: Roads (1964), 4,493 miles (919 paved); motor vehicles (1964), 38,852 (automobiles, 28,561); railways (1963), 615 miles; merchant vessels (1964), 6 (22,000 gross registered tons); airlines (1965), 8 international airlines; principal airports, Guayaquil, Quito.

Communications: Telephones (1964), 44,087; television stations (1964), 2; television sets (1964), 8,000; radios (1961), 175,000; newspapers (1962), 27.

increase in import duties, Ecuador's imports for the first three months of 1965 were 20% higher than in the same period of 1964. The combination of falling exports and rising imports upset the balance of trade.

The "banana crisis" was caused partly by increased competition for foreign markets. For example, Japan, formerly one of Ecuador's best customers, has been buying more bananas from Taiwan in recent years. Ecuador tried to compensate for such losses by increasing exports of dehydrated bananas and by producing more cocoa, coffee, and pyrethrum.

The increase in import duties, which went into effect in May, caused riots and strikes in Guayaquil, Ecuador's major port city. The government later canceled the import tax rise.

The balance of trade problem failed to affect the value of the sucre, the Ecuadorian monetary unit, which has been relatively stable since 1961. This basic financial stability is due to a previous balance of trade surplus that has existed since 1962 and to Ecuador's strong international reserves. The reserves, however, dropped from a 1964 peak of \$51 million to \$40 million by May 1965.

In recent years, Ecuador's gross national product has increased at an annual average of 5%. Inflation was controlled, and the consumer price index has increased only 4% yearly since 1960.

Development Plan. Ecuador's ten-year development plan (1964-73) was approved in 1965 by the advisory body of the Alliance for Progress. The plan, to cost an estimated \$2.5 billion, will encourage development in private housing, transportation, manufacturing, agriculture, education, and welfare. After the plan was approved, a group representing 19 countries expressed interest in providing \$173 million for 40 Ecuadorian industrial and agricultural projects. Ecuador hoped to invest \$147 million in the plan.

Agricultural Reform. Steps were taken in 1965 to implement the agricultural-reform program promulgated in July 1964. In Morona-Santiago state, 297 square miles of land were divided among 2,500 families. New coffee and banana plantations in Santo Domingo de los Caballeros attracted over 2,000 landless peasants. In other areas, however, land-reform lagged. A total of 8,649 acres was distributed to 12,500 peasants in 1964 and 1965.

Education. In a massive effort to combat illiteracy, Ecuador spent 390 million sucres on education in 1964, the largest budget item. Adult education was extended in 1965, and many new rural schools were being built.

OFFICE OF ECONOMIC OPPORTUNITY

GOVERNMENT ACTION to help children was a keynote of American education in 1965. Project Head Start prepared disadvantaged children to enter elementary school.

EDUCATION

The year 1965 was a record-breaking period for American education. School and college enrollments increased for the 21st consecutive year, reaching an estimated total of 54,200,000 in the fall. The schools and colleges were staffed by 2,300,000 teachers and 154,000 administrators. Thus approximately 56,654,000 Americans—about 29% of the population—were directly involved in education. The nation spent a record total of \$39 billion on education in the 1964-65 school year, and education was described as the number one domestic enterprise.

Increasing sums of money for schools and colleges were supplied by the federal government, with the 89th Congress surpassing the 88th in voting aid to education. Federal support was stimulated by President Lyndon B. Johnson, who spoke of education as "central to the purposes of this administration and at the core of our hopes for a Great Society."

Federal Aid to Elementary and Secondary Education. The enactment by the Congress in April of the Elementary and Secondary Education Act of 1965 marked a historic breakthrough in federal aid to education. Government aid on a broad base had been blocked for years by congressional fear of federal control and, more recently, a division of opinion on aiding parochial schools. The 1965 act met the latter problem by authorizing aid for children attending both public and parochial schools but providing for control of expenditures by public agencies.

Under Title I of the act, over \$1 billion of the \$1.3 billion authorized for the first year of the program was earmarked for children in schools serving low-income families. The money could be used to hire additional teachers and administrators, construct facilities, and acquire equipment, but not to reduce local support of education.

Title II authorized an allotment of \$100 million

for additional school library books and equipment, textbooks, and other instructional materials.

Title III authorized \$100 million for supplementary educational services, such as guidance and counseling, remedial reading, enriched academic courses, educational television, and school health.

Title IV amended the Cooperative Research Act, under which only \$16 million was allocated for the fiscal year 1965, to authorize \$100 million over the next five years for the construction and expansion of national and regional research facilities.

Title V authorized \$25 million for a variety of programs and projects designed to improve the effectiveness of state departments of education.

Federal Aid to Higher Education. In its closing days the 89th Congress gave final approval to the \$2.3 billion Higher Education Act of 1965. Described as "landmark legislation," the new bill set up the first federal scholarships, earmarked for exceptionally needy and highly capable students. An annual appropriation of \$70 million for the next three years was authorized for "educational opportunity grants." With an average award of \$500 anticipated, 140,000 scholarships would thus be made available each year.

Despite considerable opposition, the bill included authorization for a National Teachers Corps of about 6,000 teachers for schools in poverty-stricken areas. Recruits would be subsidized by federal funds, but their pay would be channeled through local school authorities. Teachers would be sent only to schools requesting them. The bill authorized \$36.1 million for the first year and \$64.7 million for the second. However, Congress adjourned without having appropriated funds for the corps.

Other innovations in the Higher Education Act were: (1) The sum of \$25 million was authorized for a one-year program to strengthen developing institutions, particularly small Negro colleges in the South, through faculty exchanges and teaching fel-

lowships. (2) Federal aid amounting to \$25 million in the first year and \$50 million in the second and third years was authorized to help solve urban and suburban problems. These funds were to be used primarily for university extension services, with "urban agents" helping city-dwellers just as county agents have helped farm families for generations. (3) Sums of \$40 million for the first year, \$160 million for the second, and \$275 million for the third were authorized to support a new program of fellowships for elementary and secondary teachers.

The bill also doubled the present \$230 million authorization for construction grants to colleges, making \$460 million in federal funds available.

Progress in Desegregation. When the 1964-65 school session ended—11 years after the Supreme Court banned segregation in public schools—only 2.25% of the 2,980,000 Negro school children in 11 Southern states were actually attending school with white children. However, when schools opened in September 1965, thousands of Negroes all across the South filed into previously all-white classrooms. As racial barriers fell in more and more school districts there was hardly a trace of the violent, bitter resistance of earlier years. In the space of a few months the percentage of Negro children in integrated schools more than doubled.

The surge in integration was attributable to one section of the Civil Rights Act of 1964. This law provided that, in order to share in federal funds earmarked for distribution to public schools in 1965, each school district had to state to the U.S. Office of Education its intention to comply with the order to integrate. At least four grades were to be desegregated in the 1965-66 session, and all grades by 1967.

By Sept. 26, 1965, only 77 of the 5,044 school districts in the Southern and border states had failed to submit desegregation plans. There were some areas of resistance in the Deep South where school districts made no effort to qualify for federal aid. However, a total of 4,719 school systems submitted integration plans that were accepted, and an additional 248 plans were under review in late 1965.

Integration gains in the fall of 1965 were impressive. In Mississippi, where only 57 Negroes attended four mixed schools in 1964-65, it was reported that scores of schools had integrated hundreds of Negroes. Alabama, which previously had enrolled only 101 Negroes in nine desegregated dis-

tricts, had more than 1,000 Negroes in mixed schools in the fall term. In South Carolina, the number of Negro pupils jumped from 265 to about 3,000; in North Carolina, from 4,900 to about 8,000; and in Georgia, from 1,300 to several thousand. Almost every school district in Arkansas, Florida, Tennessee, Texas, and Virginia was desegregated.

However, much of this change represented token integration. The overwhelming majority of Negroes still attended all-Negro schools.

To comply with federal regulations, roughly one half of the Southern school districts adopted "freedom of choice" plans under which Negroes must designate the school they wish to attend. Many Negroes chose to stay in their present schools. Civil rights leaders charged that the plans place the burden of initiative upon the Negroes, who may have to contend with community pressures. The Office of Education may reconsider the acceptability of such plans before another school year begins.

Plight of Negro Teachers. Charges that Negro teachers were losing their jobs as desegregation closed all-Negro schools were heard in many states that had set the pace for integration. Instances of dismissals in North Carolina, Florida, Arkansas, Texas, and Virginia were cited by leaders of the National Association for the Advancement of Colored People. The National Education Association (NEA) reported 300 dismissals as a direct result of desegregation.

In June 1965, U.S. Commissioner of Education Francis Keppel distributed a memorandum to chief state school officers in which he cautioned against releasing Negro teachers "on a discriminatory basis." He made it clear that the statement of policies issued April 29, 1965, which implemented Title VI of the Civil Rights Act, requires planning for the desegregation of school faculties as well as student bodies.

Project Head Start. During the summer of 1965 some 500,000 regular teachers and volunteer workers took part in an eight-week program called Project Head Start, which was designed to prepare culturally deprived children for entrance into kindergarten or first grade. In 13,400 child-development centers in 2,500 U.S. communities, approximately 560,000 children from crowded, underprivileged homes were given close personal attention to build their confidence and give them emotional reassurance. The program included physical examinations, dental care, and free meals. Parents were counseled at home

INTEGRATION of schools was speeded in 1965, but many remained segregated. Negroes in Crawfordville, Ga., held a peaceful protest by trying to board all-white school buses. Demonstrators were restrained by the police but not placed under arrest.

about ways they might help their children when the critical time of starting school arrived.

The reception of the program exceeded all expectations. In Atlanta, 1,800 children appeared at project centers on opening day, and the number grew as the program continued. In New York City, 26,000 children attended 333 centers.

As part of the war on poverty, Project Head Start operated under Sargent Shriver's Office of Economic Opportunity. More than half of the cooperating communities were in the Southern or border states. A high proportion of the children were Negro, but the entire project was integrated. Federal contributions (90% of cost) totaled \$85 million, or about \$170 per child.

Late in August, President Johnson announced that in the fall the program would be placed on a year-round basis as a permanent part of the educational system. The entrance ages were lowered to accommodate children of three years and older. Facilities for an enrollment of 350,000 needy children were made available. (See also ANTI-POVERTY PROGRAM.)

White House Conference on Education. On July 20-21, 1965, 700 leaders in education, business, labor, and government assembled in Washington, D.C. at the invitation of President Johnson to exchange views on major problems in education. The president charged the conference to produce "an agenda for the nation's future course in education." The delegates, in general sessions and panel discussion groups, centered their attention on improving the quality of education, extending educational opportunities, educating for world responsibilities, and expanding higher education.

Observers were disappointed that the conference failed to produce the lively debate anticipated. The most controversial proposal was that federal testing of samples of students across the nation be used to assess accomplishments in specific regions and types of schools.

The *New York Times* (July 22, 1965) singled out the emergence of a new leadership in education as the most striking fact of the conference, citing such men as John W. Gardner, president of the Carnegie Corporation and chairman of the conference; Francis Keppel, U.S. commissioner of education; and James B. Conant, a leader in the movement to improve public schools and teacher training. Gardner earlier had served as head of the presidential task force that helped shape the administration's education program. A few days after the end of the con-

STUDENT UNREST in colleges made headlines in 1965. Mario Savio led protests at California's Berkeley campus.

ference, President Johnson announced the appointment of Gardner as secretary of health, education, and welfare. In December, Keppel was promoted to the post of assistant secretary and Harold Howe II was named the new commissioner of education.

Improvements in the Schools. Despite segregation problems in the South, racial friction over busing of pupils in the North, and complaints about the curriculum and about teaching, many U.S. educators felt that schools had improved vastly. This feeling was revealed in interviews across the nation reported by *U.S. News and World Report* (Sept. 13, 1965).

Mentioned most frequently as evidence of improvement were programs in mathematics and science; the spread of team teaching; the use of educational television, teaching machines, and other aids to learning; the acceptance of the ungraded school; upgrading of vocational education; and the development of independent study and advanced placement programs in high schools.

Academic standards, many teachers reported, had gone up sharply in recent years. Some elementary schools were teaching foreign languages, and some high schools were offering courses in calculus and philosophy.

The school day and school session had been lengthened in many communities. Children were starting to school earlier.

The most modern programs, facilities, and equipment were found in schools serving the well-to-do

REORGANIZATION plans for public schools produced controversies. In New York City pickets marched to protest against plans designed to hasten school integration.

PRESIDENT JOHNSON signs history-making education bill on April 11. His first teacher, Mrs. Kate D. Loney, looks on.

residential suburbs of large and small cities. In many large cities, antiquated buildings, a shortage of teachers, and most of all the meager home backgrounds of many pupils resulted in low educational achievement. However, federal aid for urban education pointed the way to improving city schools.

Student Unrest in the Colleges. What *Time* magazine characterized as "a year of churning unrest on U.S. campuses" began in the fall of 1964 on the Berkeley campus of the University of California. The immediate cause of trouble was a ban by university authorities on student gatherings for political and social causes in a formerly exempt area just outside the Sather Gate of the campus. To oppose the ban, some 20 student organizations formed a United Front coalition, later reorganized as the Free Speech Movement. The most prominent leader of the movement was Mario Savio, a senior philosophy major who later was suspended by the university. A substantial number of nonstudents living near the university took an active part in the controversy.

Unrest continued to grow, in spite of the efforts of the regents and administrative officers to cope with the situation. Events reached a climax on Dec. 3, 1964, when Governor Edmund G. Brown ordered some 600 police to break up a massive sit-in staged by students in the administration building, Sproul Hall. Nearly 800 young men and women were arrested. Efforts to settle the controversy continued

into the spring of 1965. A faculty committee was helpful in reconciling the issues between students and the administration. The regents and administration agreed not to punish the arrested students, and expressed their willingness to confer with students and faculty about campus rules and regulations. Discussions superseded demonstrations.

Various reasons were assigned for the wave of student unrest that engulfed Berkeley and other campuses. The very size of the modern university—27,000 students at the Berkeley campus, for example—and the impersonality of the entire educational process were frequently cited. It was alleged that universities have become research centers, so concerned with government contracts and service activities that they give only passing attention to students. The gulf between faculty and students has widened, particularly in the "multiversities" where little personal contact is possible.

Many of the numerous articles and books dealing with unrest in the colleges pointed to growing student interest in social and political problems. The political and social apathy so much noted among the nation's college students in the 1950's was succeeded by a concern for social justice. Interest in civil rights led not only to demonstrations but also to active service in the cause of voter registration, instruction of disadvantaged youth, and other voluntary endeavors during vacation periods. Some students applied the tactics of political activism to campus problems.

College and university authorities tried various means to improve relations with students. Many large universities made particular efforts to get faculty and students into a closer relationship and to improve channels of communication linking administration, faculty, and students. Several universities, including Yale and Cornell, introduced the policy of using student ratings of teaching performance as one factor in deciding faculty promotions. In many ways, colleges allowed students increased freedom and influence. College administrators urged that students use their new opportunities with a strong sense of responsibility.

Arts-Humanities Foundation. The 89th Congress established two national endowments, one for the arts and one for the humanities. Each had a chairman and a national advisory committee, and received an authorization of \$5 million per year for 1966, 1967, and 1968. Funds were to be used to promote creative endeavor, scholarship, and teaching in the arts and the humanities, doing for these fields what the National Science Foundation has done for the sciences. A Federal Council on the Arts and Humanities was created to coordinate the activities of the two endowments.

Elementary and Secondary Enrollments. Secondary enrollments remained about the same as in 1964-65 (12,900,000), while the number of elementary students increased 1.1% (to 35,900,000).

Nonpublic school enrollments, which are included in the above estimates, increased in about the same proportion, with 5,400,000 boys and girls enrolled in private elementary schools and 1,400,000 in private high schools in 1965-66.

A record number of 2,700,000 high school graduates was reported for 1964-65, an increase of 400,000 over the preceding year. About half of them entered college in the fall.

School Teaching Staffs. In 1965-66 the public and private schools of the United States had 1,931,000 teachers, an increase of 1.5% from the previous year,

COLLEGE AND PUBLIC SCHOOL ENROLLMENTS
millions

VT. ME.

Source: National Education Association

The average annual salary of classroom teachers in 1964-65 was \$6,220; of all instructional personnel, \$6,400.

At the high school level the chief problem was the distribution of teachers among major teaching fields. Some, such as social science and men's physical education, had an oversupply, while others, such as science and mathematics, suffered from shortages.

College Enrollment Trends. In 1965-66, colleges and universities experienced the full impact of the

Of the 5,435,000 college students enrolled in the fall of 1965, 3,519,000 were in public institutions and 1,916,000 in private institutions. Final statistics show that in the decade 1954-64 enrollment in higher education doubled. However, the increase in public institutions was 134%, or more than twice the 62% increase in private institutions. A substantial part of this increase has come through the spread of junior or community colleges, which in 1965 had an estimated enrollment of 791,000, representing an increase of 80,000 in a single year. There were 710 junior colleges by June 1965, with 20 to 30 new ones opening each year. California alone had nearly 80 junior or community colleges.

College Teaching Staffs. In 1965-66 the higher education instructional staff for resident degree-

credit courses totaled 415,000, according to Office of Education estimates. The figure represented an increase of 8.1% over 1964-65. Approximately 229,000 teachers were employed in public colleges and universities, and 186,000 in nonpublic institutions.

Student Aid. In the 1963-64 school year, 1,852 institutions awarded over \$331 million to students in the form of scholarships, service grants, loans, and employment—an increase of 57% in four years. Many institutions made a “package award,” combining loans, scholarships, and job aid. By type of assistance, scholarships and service grants totaled \$163 million; student employment, \$144.6 million; and loans, \$23.8 million.

Private institutions enrolled only 36% of all students but awarded 55% of the total aid, according to the Office of Education.

In addition to the above types of institutional aid, the National Defense Student Loan program had loaned a total of \$562 million to 885,000 undergraduate and graduate students as of June 30, 1964. In 1965, approved requests for funds from colleges and universities amounted to \$137 million. For 1966, an appropriation of \$186 million for NDS loans was requested. By June 30, 1965, \$700 million in loans had been made available to 1 million students.

College Work-Study Program. The inauguration of the College Work-Study Program, designed to assist students whose parents have an annual income of \$3,000 or less, helped many students pay their expenses. Through on-campus work activities, students could earn \$1.25 an hour for up to 15 hours per week while attending classes, or a total of approximately \$600 each for an academic year. National Defense Student Loan Funds were available to supplement earnings.

Degrees Conferred. A record number of college degrees was conferred in 1964, according to the Office of Education. Bachelor's and first professional degrees totaled 460,467, up 12% over the previous year. Almost one fourth were granted in education (112,503), with the social sciences (76,964) as the next most popular area of study. Master's degrees totaled 101,122, up 11%. About two fifths, 40,700, were in education. Doctorates increased 13%, totaling 14,490. The physical sciences led with 2,455, followed by education with 2,348.

The proportion of women obtaining degrees has varied but little for several years. In 1964 approximately 40% of the bachelor's degrees, 32% of the master's, and 11% of the doctorates went to women.

In 1965, according to the Office of Education, the number of degrees granted at all levels increased again. The estimated totals were: bachelor's and

first professional, 525,000; master's, 111,000; and doctor's, 15,300.

International Exchange. In 1964-65, 82,045 foreign students were enrolled in American colleges and universities. This number represented an increase of nearly 10% over the preceding year, according to the Institute of International Education.

The Far East contributed 29,400 foreign students, or 36% of the total. Latin America sent 13,600 students, or 17% of the total, followed by the Middle East, with 11,200 (14%); Europe, with 10,100 (12%); North America, with 9,300 (11%); Africa, with 6,800 (8%); and Oceania, with 1,200 (2%).

In 1964-65, at least 20,000 Americans were studying abroad, mainly at European universities.

Expenditures for Education. The Office of Education reported that total expenditures for education at all levels, public and private, reached a new high of \$39 billion in 1964-65, nearly three times the 1953-54 total of \$13.9 billion. Expenditures for current operations and interest payments totaled \$32.8 billion, of which \$25.5 billion was for public education and \$7.3 billion for private. Expenditures for capital outlay were \$6.2 billion, of which \$4.9 billion was for public education and \$1.3 billion for private education. By level of schooling, \$26.9 billion went for elementary and secondary education, and \$12.1 billion for higher education.

The operating costs of America's colleges and universities, public and private, increased 28% between 1961-62 and 1963-64. Of the \$9.2 billion spent in the latter session, \$2.8 billion went for faculty salaries and other instructional costs, an increase of 25%. The second largest outlay was nearly \$2 billion for organized research or large-scale separately budgeted projects, an increase of 33%. Financed largely with federal funds, the projects were mainly in the fields of health, agriculture, space exploration, and defense. They constituted 21% of the day-to-day costs of operation.

Education of the Population. In slightly more than a generation, the amount of schooling of the U.S. population increased by four full years, according to *American Education* (June 1965), the new monthly magazine of the Office of Education. Persons 65 and over had an average of 8½ years of school, while those between the ages of 25 and 29 had completed an average of 12½ years.

NEW CAMPUS with trailers for dormitories was opened by the University of California at Santa Cruz in 1965. House trailers in star-shaped groups are quarters for 356 students while construction of permanent classrooms and dormitories is being completed.

MAYORALTY ELECTIONS commanded much attention in a relatively quiet political year. Elliott Roosevelt (above), son of the late President Franklin D. Roosevelt, was elected mayor of Miami Beach, Fla., on June 1. Samuel W. Yorty (below) was reelected mayor of Los Angeles on April 7.

ELECTIONS

Returns from scattered off-year elections in the United States in 1965 gave no indication of further shifts in popular support toward the Democratic party. Instead, they revealed that attractive candidates with well-organized campaigns can overturn established political arrangements, even in Democratic strongholds.

New York City. By far the most significant election result was the victory of John V. Lindsay in New York City's mayoralty contest on November 2. His defeat of the Democratic nominee, City Controller Abraham D. Beame, came about because of the disenchantment of most voters with uninspired Democratic leadership.

Lindsay, a liberal Republican member of Congress from Manhattan's so-called Silk Stocking district, announced his candidacy before Mayor Robert F. Wagner, a Democrat, said on June 10 that he would not seek reelection. Lindsay was endorsed by the Liberal party on June 28 by a vote of 800 to 50, and he was unopposed for the Republican nomination.

The Democratic primary on September 14 was marked by a factional struggle. Beame was supported by such entrenched party leaders as Charles A. Buckley of the Bronx, Stanley Steingut of Brooklyn, and Adam Clayton Powell of Harlem. His principal opponent, City Council President Paul Screvane,

JOHN V. LINDSAY, a progressive Republican supported by the Liberal Party and by a number of independent Democrats, was elected mayor of New York City on November 2.

was supported by Mayor Wagner. Beame defeated Screvane by 327,934 to 268,991 votes.

In his campaign, Lindsay avoided the Republican label and refused to seek help from national party leaders. The acidly witty Conservative party candidate, William F. Buckley, Jr., hoped to secure the defeat of Lindsay, whom he did not regard as a true Republican. But Buckley also took conservative votes away from Beame. Vice President Hubert H. Humphrey and Senator Robert F. Kennedy (D, N.Y.) campaigned for Beame, but President Johnson delayed an endorsement until October 29.

Election returns gave Lindsay 1,156,915 votes, nearly 46% of the total. Beame received 1,030,771, and Buckley, 339,137. Lindsay cut heavily into Democratic expectations among reform-minded voters within the Negro, Jewish, and other communities.

State Elections. In New Jersey, Governor Richard J. Hughes, a Democrat, was reelected November 2 over Republican Wayne Dumont, who had developed a conservative image partly as a result of his demand that Rutgers University dismiss Professor Eugene D. Genovese because Genovese expressed the hope that the Vietcong would win the war in Vietnam. Hughes carried 16 of New Jersey's 21 counties, and Democrats won control of both houses of the legislature for the first time since 1914.

Also on November 2, Virginia voters elected to the governorship Mills E. Godwin, a Democrat. The

winner received 48% of the vote, as against 37.3% for A. Linwood Holton, Jr. (Republican), 13.7% for William J. Story (Conservative), and 1% for George Lincoln Rockwell (American Nazi). Godwin was supported by the Democratic organization, headed by Senator Harry F. Byrd, Sr., and by large majorities of Negro and labor union voters.

In other state elections, New York Republicans regained control of the Senate, but Democrats retained a majority in the Assembly. An overwhelming vote sent former Senator Kenneth Keating, a Republican, to the Court of Appeals, the state's highest court. New York voters approved \$1 billion in bonds for water pollution control and a state constitutional convention for 1967, but rejected proposals for low-income housing and longer legislative terms.

In Kentucky, voters gave Democrats increased control of the legislature and approved \$176 million in bonds for highways and buildings. In Florida, a \$300 million highway bond issue was rejected, but in North Carolina that amount for highway bonds was approved. Ohio voters rejected an increase in the sales tax. A proposal for four-year terms for state officials in Texas was rejected despite strong support by Governor John B. Connally.

A plan for state legislative reapportionment in Ohio, opposed by Democratic and labor organizations, was rejected on May 5. In a Georgia election on June 16 for the state House of Representatives, which was reapportioned by federal court order, Democrats retained control, but 20 of the 49 Republican candidates were elected. Negro Democrats were elected in seven districts. A special election in Vermont on November 23, following reapportionment of both legislative chambers by federal court order, resulted in increased Republican control.

Other Elections. A hard-fought nonpartisan campaign for mayor of Los Angeles resulted in the reelection on April 6 of Samuel W. Yorty, who defeated Representative James Roosevelt and six other candidates. On June 1, Elliott Roosevelt, another son of former President Franklin D. Roosevelt, was elected mayor of Miami Beach, Fla.

On June 8, voters in Mississippi broke precedent by choosing Republican mayors in Hattiesburg and Columbus, and Republican officials in six towns.

In South Carolina, Albert W. Watson, who had joined the Republican party and resigned from Congress after Democrats in the House had voted to discipline him for supporting the 1964 Republican presidential ticket, was reelected by a 2 to 1 margin in a special congressional district election on June 15. In another congressional election, on November 2 in Ohio, Clarence J. Brown, Jr., won the seat previously held by his father, who died on Aug. 23, 1965.

In Philadelphia, Arlen Specter, formerly a Democrat, was elected district attorney as a Republican with much bipartisan support in a strongly Democratic city. In Cleveland, Democratic Mayor Ralph S. Locher was narrowly reelected over Carl B. Stokes, a Negro running as an independent Democrat. In Boston, Mrs. Louise Day Hicks, a staunch defender of neighborhood districts, was reelected to the school committee despite opposition by civil rights groups. In Louisville, broad support from Negroes helped Republicans retain the mayoralty. (See also **POLITICAL PARTIES** and articles on individual states and cities.)

Governmental Research, University of Maryland

ELECTRICAL INDUSTRIES

The importance of electric power to metropolitan areas was underlined on Nov. 9, 1965, when a blackout hit most of six northeastern states and Canada's Ontario Province, affecting about 30 million people. A huge surge of power flowed into the United States after an automatic protective device at a plant of the Ontario Hydroelectric Power Commission caused the disconnection of transmission lines from that plant into Canada. This, in turn, caused interruptions throughout most of the Canada-United States Eastern Interconnection.

The individual utility systems in the grid quickly took steps to make the possibility of recurrence remote. Protective measures included the strengthening of internal systems by the addition of equipment for quick restart of generators, and the improvement of interconnections with other companies so that each can be assured of drawing on its neighbors for emergency support. (See also **FEDERAL POWER COMMISSION**.)

More Atomic Power. By late 1965 there were 14 atomic power plants in operation in the United States, and two other projects had attained criticality—the ability to sustain a chain reaction. These 16 atomic power projects had a combined capacity of about 1.1 million kilowatts. An additional 14 atomic projects, with a total capacity of about 6.1 million kilowatts, were in various stages of construction, design, or planning for service by the late 1960's or early 1970's. Investor-owned electric utilities participated in 22 of the 30 projects, and also took part in the nine programs involving atomic research or development.

Record Output. A record production exceeding 1 trillion kilowatt-hours was registered by the total electric utility industry in the United States in the 12 months ended July 31, 1965. The total net electric power generation by investor-owned power companies, government-owned agencies, and rural electric cooperatives rose 6.6% above output in the previous 12-month period. The industry's total generating capacity reached a record 230.3 million kilowatts, representing a 6.1% increase in 12 months.

Investor-owned utilities provided most of the country's installed capacity, accounting for 76%

UPI PHOTOS

WHEN THE LIGHTS WENT OUT, New York's glittering towers (above) became sombre silhouettes against the nighttime sky (below). On Nov. 9, 1965, an electrical power outage plunged large sections of the Northeastern states and parts of Canada into darkness, severely disrupting transportation and services.

at the beginning of 1965. Governmental agencies accounted for 23%, and rural electric cooperatives for 1%. Of the electric energy produced in the 12 months ended July 31, 1965, fuel-burning plants (including atomic plants) supplied 81.7%, and hydroelectric plants 18.3%.

Electric utilities added almost 1.5 million customers in the 12-month period, bringing the total number of customers to nearly 65 million. Residential customers comprised 87.7% of the total, or more than 57 million. Commercial and industrial customers made up another 11.9%, numbering more than 7.7 million. (The remaining customers included highway and rail systems and public authorities.) During the period, commercial and industrial customers purchased about 614.9 billion kilowatt-hours, an increase of more than 6%.

Residential customers purchased about 272.2 billion kw-hr, an increase of 19.6 billion over the preceding 12 months. The average residential customer used 4,823 kw-hr during the 12 months ended July 1965, or about 5.3% more than in the previous 12 months. He paid 2.28 cents per kw-hr, or about 2.1% less than a year earlier.

Largest Industry. Investor-owned electric utilities comprise the largest single industry in the United States. These companies had a total investment of nearly \$57 billion in electric plants and equipment at the beginning of 1965, and spent \$4 billion for new construction during the year. Electric utilities use more coal than any other American industry—more than 225 million tons in 1964, most of it from the Appalachia region.

In addition, electric utilities bought more than 100 million barrels of oil and more than 2,300 trillion cubic feet of natural gas.

Upsurge in Europe. World output of electric energy for 1965 was expected to total about 3 trillion kw-hr. In the United States, plans call for about doubling the nation's capacity in the next 10 years. In most European countries, plans for the 1964–1968 period call for building new power plants that will increase total capacity more than 50% above the 1963 level, according to a report of the Economic Commission for Europe. Atomic power plants represent 14% of the new capacity to be brought into service during that period in France and Britain. Conventional fuel-burning plants were expected to account for 80%

or more of the new capacity in Britain, Belgium, Bulgaria, Cyprus, Czechoslovakia, Denmark, Hungary, Ireland, Netherlands, Poland, and West Ger-

many. Hydroelectric stations were expected to account for all of the new capacity in Luxembourg and Norway, 91% in Switzerland, and 81% in Austria.

PETER VAN NOTE
Associate Editor, Edison Electric Institute

ELECTRONICS

Factory sales of electronic products in the United States in 1965 amounted to \$17 billion, or about \$800 million greater than the 1964 total. Although sales to the government decreased, industrial and consumer sales increased sufficiently to provide greater total sales in 1965. The demand for electronic products for computer, process control, and instrumentation applications in industry was especially strong, as was the demand for color television sets by consumers. The continued rising demand for these sets resulted in parts shortages and slower deliveries.

According to the Electronic Industries Association, sales to the government totaled \$9.185 billion (down 5.3%); sales to industries, \$3.865 billion (up 11.1%); and sales to consumers, \$3.335 billion (up 13.4%). Sales of replacement components amounted to \$630 million.

Effects of the War in Vietnam. The stepped up fighting in Vietnam apparently resulted in a heavy increase in the production of standard and advanced communications systems.

By October 1965, the demands of the struggle in Vietnam apparently led to some adverse effects on the production of electronic equipment. In November the Martin Company reported that the quality of wires, connectors, and other materials it had received from suppliers had decreased alarmingly. Subsequently, other firms reported there was some laxity in the quality-control procedures of suppliers of materials. However, by the end of the year, most companies noted that quality itself was not the problem, but that copper shortages, longer time intervals between design and production, and slower deliveries were occurring. Delays were reported in deliveries of crystals and crystal filters, transformers, and capacitors.

Gemini Flights. The electronics industry received a big boost from the performance of electronic products carried by the Gemini spacecraft. During the flight of Gemini 3 on March 23, 29 of the 30

major electronic systems worked perfectly. Gemini 3 probably was the first spacecraft that had completely modular electronic systems and components. The flight also marked the first time that a communications link was established between a ground station, a satellite, and a manned spacecraft. When normal communications from tracking ships to the spacecraft had been lost temporarily, Gemini 3 received messages that were relayed from a ground station by the Syncom 3 satellite.

In June, experiment packages carried by Gemini 4 worked successfully. A proton-electron spectrometer measured radiation levels just outside the spacecraft, and a three-axis magnetometer measured the local magnitude and direction of the earth's magnetic field.

In August the Gemini 5 flight caused some tense moments when problems developed with the fuel cells and with ground and on-board computers. Nonetheless, experiment packages in the spacecraft obtained data that provided notable advances in celestial and space-object radiometry. The equipment for these measurements included a cryogenically cooled interferometer-spectrometer that gave superior performance in the infrared spectral region.

In December the two-week flight of Gemini 7 and the spectacular rendezvous of Gemini 6 and Gemini 7 provided stringent long-life tests of electronic systems in a space environment. The performance of the fuel cells, made by General Electric and Garrett AiResearch, exceeded expectations. The digital computer, manufactured by International Business Machines, and stabilized platform, made by Honeywell, that were used in orbital navigation maneuvers performed well. The Gemini 7 astronauts had laser equipment for spacecraft-to-ground laser voice communications. Both astronauts spotted the ground laser beacon, but no voice communications were established. (See also SPACE EXPLORATION.)

Industrial Uses for Space Technology. Government and industry leaders expressed concern over the apparent lag in the industrial utilization of the technological know-how developed in the space program. To speed up this use of space technology, NASA awarded study contracts to four companies.

Nevertheless, a start has been made toward utilizing developments in space technology for industrial and commercial applications. General Electric planned to produce the Gemini 5 type of fuel cells for industrial and consumer markets by early 1966. The Early Bird satellite, owned by the Communications Satellite Corp., was launched in April and soon thereafter provided international commercial communications services. In December 1965, only 5½ years after the first laser model was developed by Dr. Theodore H. Maiman, lasers were used in production work at a Western Electric plant in Buffalo, N.Y.

Product Trends. Advances in techniques to produce hybrid and integrated circuits highlighted electronic product developments, and these circuits continued to find new applications. (A hybrid circuit consists of combinations of thin-film devices, discrete components, and integrated semiconductor circuits. In an integrated circuit, all circuit components are formed in a single small block of semiconductor material.) New applications and improved fabrication techniques in this competitive segment of the industry resulted in price cuts, and some units were sold for less than 50 cents apiece. Also, the price of some silicon controlled rectifiers was about 50

cents each. The price was \$300 in 1957.

A disquieting number of counterfeit semiconductor devices, bearing fraudulent names of reputable manufacturers, appeared on the market in the first quarter of 1965. The devices apparently were bought as surplus units from any available source. After being relabeled with false data on the manufacturer or the device type, they were sold as original equipment through unfranchised distributors. Increased vigilance by users who were warned of the practice seemed to stem the situation.

Computers. Advances in the computer field consisted primarily of development, consolidation, and the refinement of existing technology. More systems were made compatible, and there was a greater use of integrated or hybrid circuit systems. Computer time sharing, which should provide increased economy, flexibility, and the advantages of centralized data processing, was inaugurated commercially. (See also *AUTOMATION*.)

NAT SNYDERMAN

News Editor, "Electronic News"

ELIOT, Thomas Stearns

British-American poet, playwright, and critic: b. St. Louis, Mo., Sept. 26, 1888; d. London, England, Jan. 4, 1965.

Among poets writing in English in the 20th century, T.S. Eliot was unmatched in either reputation or influence. He dominated the course of poetry and ideas about poetry between the two World Wars. Eliot won the Nobel Prize in literature in 1948.

Life. Descended from a distinguished New England family, he was the grandson of William Greenleaf Eliot, who founded Washington University. Eliot attended Smith Academy, St. Louis, and Milton Academy, Milton, Mass., and in 1906 he entered Harvard College. His major study was philosophy, but he also edited and contributed poems to the *Harvard Advocate*. Completing the college course in three years, he continued his studies in the Harvard graduate school, at the Sorbonne in Paris, at Philipps University in Marburg, Germany, and at Oxford. He completed a doctoral dissertation on the British philosopher F.H. Bradley, but did not return to Harvard to accept his degree.

In 1915, after teaching briefly at a boys' school near London, he was employed as a clerk in Lloyd's Bank. In 1917 he began to earn his living by writing. He was assistant editor of the *Egoist*, a British literary magazine, from 1917 to 1919. A physical condition prevented his entering the United States Navy in 1918. In 1922 he founded the *Criterion*, a quarterly review that he edited until he halted its publication in 1939 at the beginning of World War II. From 1925 he was employed by the publishing house Faber and Faber, eventually as a director.

Eliot became a British citizen and a member of the Church of England in 1927. In 1915 he had married British ballet-dancer Vivienne Haigh-Wood, who was confined in mental institutions from 1930 until her death in 1947. Ten years later, he married his secretary, Valerie Fletcher.

In addition to the Nobel Prize in literature, Eliot received the British Order of Merit in 1948. President Lyndon B. Johnson awarded the poet (*in absentia*) the Presidential Medal of Freedom in 1964.

Writings. Paradoxically, Eliot was the most modern and the most traditional, the most influential and

LONDON DAILY EXPRESS

T.S. ELIOT was married to Esme Valerie Fletcher (shown above) in 1957, ten years after the death of his first wife.

the most influenced, of poets. Some of the major influences on him were Dante, Elizabethan and Jacobean drama, and the French symbolist poets of the late 1800's. The French poet Jules Laforgue was the chief influence on Eliot's early poems. From Laforgue, Eliot acquired a conversational style, with abrupt alternations between cynical wittiness and poignant lyricism. The most famous of Eliot's early poems, *The Love Song of J. Alfred Prufrock*, first appeared in the Chicago magazine *Poetry* in 1915. In his subsequent poems, there is a blended echoing and quoting from various sources.

Eliot's major themes are the individual's isolation from his world, and the problem of personal identity in relation to time and to intimations of timelessness. With characteristic complexity, these themes are related to sex and the course of history in *Gerontion* (1919) and *The Waste Land* (1922). With increased emphasis on religious experience, the same themes appear in *Ash Wednesday* (1930) and *Four Quartets* (1943). Although Eliot's great reputation was produced mainly by *The Waste Land*, some critics, including Eliot himself, considered *Four Quartets* his finest achievement.

The themes of Eliot's poetry also appear in his verse dramas. *Murder in the Cathedral* (1935), modeled on Greek tragedy, treats the martyrdom of St. Thomas à Becket. *The Family Reunion* (1939) treats the questions of guilt and atonement in a contemporary secular setting. *The Cocktail Party* (1950), *The Confidential Clerk* (1954), and *The Elder Statesman* (1959) show a gradual development of the attitude that isolation may be resolved by the familiar human relations of love and understanding.

Eliot's criticism brought fresh insights into older literature. It clarified, often by implication, his own intentions in poetry and drama.

Collections of his works include *Selected Essays* (1950), *The Complete Poems and Plays* (1952), and *Collected Poems, 1909-1962* (1963).

Bibliography.—Unger, Leonard, *T.S. Eliot: A Selected Critique* (New York 1948); Williamson, George, *A Reader's Guide to T.S. Eliot* (New York 1953); Jones, David E., *The Plays of T.S. Eliot* (London 1960); Unger, Leonard, *T.S. Eliot*, pamphlet (Minneapolis 1961).

ELIZABETH II. See GREAT BRITAIN.

EL SALVADOR

Controversy continued in El Salvador during most of 1965 over the government's attempts to implement its social and economic reform program. Although the economy was damaged by a severe earthquake in May, and by a decline in coffee exports, industrial expansion provided some basis for optimism.

Politics. The Legislative Assembly, elected in 1964 under a new system of proportional representation, came under attack as being no more effective than its predecessors. The Christian Democrats, the chief opposition party in the assembly, proposed several measures designed to weaken the position of the majority Party of National Conciliation. Other elements in the government wanted to outlaw the Christian Democrats on grounds that they took orders from abroad.

There was speculation about the probable course of the military, which seemed to be divided by the assembly controversy and by President Julio Rivera's reform program. There were persistent reports that

wealthy interests were trying to enlist military support in their opposition to the reform program.

President Rivera, in a speech given in October, said that army officers had the right to participate in politics as private citizens, but had no right to interfere in the electoral process. It seemed clear that he hoped the army would continue to concentrate on its Civic Action programs in education, public health, and construction.

Earthquake. One of the worst earthquakes in El Salvador's history shook San Salvador and its suburbs on May 3, leaving about 100 dead and 500 injured. Nearly 5,000 buildings were destroyed and another 14,000 damaged. Assistance was rushed to El Salvador from the four other countries in the Organization of Central American States, and from United States installations in the Panama Canal Zone.

Economy. Conservatives protested, without much success, against the government's economic reform measures. They objected to laws passed in 1965 regarding social security, minimum wages, and labor code reform. Protests were particularly strong when the government passed a minimum farm wage act and abolished the payment of wages in food in rural areas. The Institute of Rural Colonization, a government agency that offers land to peasant families, also stirred controversy. Property owners complained about the 1964 increase in income and profits taxes, partly on the grounds that these taxes frightened away foreign capital.

It seemed apparent that the economy would not grow in 1965 at the satisfactory rate of 9% achieved in 1964. A National Development Plan for 1965-69, calling for an annual industrial growth rate of 14%, was announced by the government. The 14% rate will be difficult to achieve, however, if coffee sales continue to be poor. Much of the Salvadoran crop could not be sold under the International Coffee Agreement quota.

The value of commodities exported in the first five months of 1965 was \$165.5 million, a decrease of some 18% from the comparable period in 1964. The drop was caused chiefly by the lower shipment of coffee, which El Salvador withheld from the world market in an effort to raise prices. Corn imports for the same period in 1965 were at a record high because of a small domestic crop. It was expected that the 1965-66 crop would be even smaller.

Communism. The issue of Communist subversion continued to stir debate. In April a labor congress was held in San Salvador, and, because it included Communist-controlled unions, there was some fear that it would promote subversion. However, President Rivera said in June that the Communist problem was under control. In July the University of San Salvador charged that its mail from Moscow had been opened by government officials. Two Chilean professors, suspected of being Communist agitators, were expelled from El Salvador in August.

Proposed Canal. The possibility of building a U.S.-Nicaraguan sea-level canal through Nicaragua aroused Salvadoran opinion. It was asserted that any concessions to the United States involving rights in the Gulf of Fonseca would have to include an agreement with El Salvador also.

ROBERT JONES SHAFER

Professor of History, Syracuse University

EL SALVADOR: Information Highlights

Area: 8,260 square miles.
Population: 2,824,000 (July 1, 1964, est.).
Chief Cities (1961 preliminary census): San Salvador, the capital (1963 est.), 281,122; Santa Ana, 73,864; San Miguel, 38,330; Nueva San Salvador, 26,911.
Government: President—Lt. Col. Julio Adalberto Rivera (took office July 1, 1962); Vice President—Francisco Roberto Lima (took office, July 1, 1962). **Legislative Assembly**—52 members; party seating (1965): Party of National Conciliation, 32; Christian Democrats, 14; Renovating Action party, 6.
Religious Faiths: Roman Catholics, 98% of population.
Education: Literacy rate (1961)—49% of population aged 15 and over. **Total school enrollment** (1962)—403,676 (primary, 359,439; secondary, 25,543; teacher-training, 5,555; technical, 10,013; higher, 3,126).
Finance (1964 est.): Revenues, \$89,635,000; expenditures, \$89,635,000; public debt (1962), \$14,520,000; monetary unit, colón (2.50 colones equal U.S.\$1).
Gross National Product (1963): \$713,600,000.
National Income (1963): \$639,200,000; average annual income per person, \$235.
Economic Indexes (1964): **Manufacturing**, 158 (1958=100); **cost of living**, 100 (1958=100).
Manufacturing (metric tons, 1964): Sugar, 115,000; cement, 88,000; wheat flour (1963), 27,000; cotton yarn, 3,720; beer (1963), 142,000 hectoliters.
Crops (metric tons): Coffee (1964), 111,000 (ranks 8th among world producers); maize (1964), 184,000; cottonseed (1964), 138,000; rice (1963), 21,000; dry beans (1963), 20,000; sisal (1963), 3,000.
Minerals: Gold (1960), 1,121 troy ounces; lime (1963), 477 metric tons; limestone (1963), 107,100 metric tons; salt (1964), 25,000 metric tons; silver (1960), 76,809 troy ounces.
Foreign Trade (1964): **Exports**, \$178,000,000 (chief exports: coffee, \$93,440,000; cotton, \$37,120,000); **imports**, \$191,000,000 (chief imports, 1963: nonelectrical machinery, \$15,188,000; motor vehicles, \$11,452,000; textile yarn and fabrics, \$9,856,000). **Chief trading partners** (1963): U.S. (took 25% of exports, supplied 34% of imports); West Germany (took 23% of exports, supplied 9% of imports); Japan (took 25% of exports, supplied 6% of imports).
Transportation: **National roads** (1964), 4,940 miles; **motor vehicles** (1963), 32,471 (automobiles, 22,928); **railways** (1963), 378 miles; **principal airport**, Ilopango.
Communications: **Telephones** (1964): 20,600; **television stations** (1964), 3; **television sets** (1964), 30,000; **radios** (1962), 358,000; **newspapers** (1961), 13 (daily circulation, 122,000).

NOVELISTS C.P. Snow (left), who became a peer in 1964, and Angus Wilson attracted much literary attention in 1965 for *Corridors of Power* (Snow) and *Late Call* (Wilson).

ENGLISH LITERATURE

Two recent events emphasized the diminution, if not the extinction, of the aristocratic spirit in English letters: the deaths of Dame Edith Sitwell (Dec. 9, 1964) and of T.S. Eliot (Jan. 4, 1965). *The Times Literary Supplement* of London, in the first of a series of issues entitled *Sounding the Sixties*, maintained that violence is the literary keynote of the 1960's, and that in the drama "the images of Beckett, Weiss, and Pinter are dominant." Certainly the abyss between Eliot's *The Cocktail Party* (1950) and Pinter's *The Homecoming* (1965) is immeasurable.

Fiction. Of the novels that appeared during the 1964-65 publishing year, the first two that attracted considerable critical attention were by C.P. Snow and Angus Wilson. Of the two, the more widely read and criticized was Snow's *Corridors of Power* (1964), the ninth volume in his *Strangers and Brothers* series. Interest in the novel was intensified by the author's elevation to the House of Lords as Lord Snow of Leicester on recommendation of the

Labour government. In *Corridors of Power*, as in Snow's earlier novels, Lewis Eliot is the narrator. He recounts the rather unscrupulous means by which Roger Scaife becomes Conservative minister of defense, Scaife's attempt to develop support for a bill to ban Britain's production of nuclear bombs, his failure to get the necessary parliamentary support, and his consequent resignation. Not only literary critics but politicians and historians discussed the novel. Their consensus seemed to be that Snow's knowledge of the power struggle was formidable but not impeccable, and that his civil servants tended to be merely civil servants and not full-bodied human beings.

Wilson's *Late Call* (1964) has a private and not a public subject. Its central character is Sylvia Calvert, whose boastful and self-deceived husband has forced her out of the management of their hotel. The Calverts go to live in one of the small recent British urban developments called new towns. They move in with their recently widowed son—a progressive schoolmaster and a do-gooder—and with his three problem children. The son's pretentious attempts to make the new town a civilized place is contrasted with the mother's quiet and devoted goodness. She does what she can with the difficult children, and, when freed by her husband's death, she finds the courage to begin life for herself. Although some critics felt that Wilson was more successful in satirizing the aspirations of the denizens of the new town than in making his heroine's goodness convincing, all agreed that he showed a new warmth and kindness of spirit.

The novels most widely noticed in 1965, on the whole, found their subject matter in the lives of characters from the less-privileged social classes. Doris Lessing's *Landlocked*, the fifth novel in her *Children of Violence* series, shows her South African heroine, Martha Quest, at a point where her unsuccessful second marriage is about to end in divorce. She moves in Communist circles and finds there a lover. When the affair has come to its end with her lover's death, and when the rosy glow around communism has faded, she plans to leave for England. Mrs. Lessing communicates effectively the states of mind of her muddle-headed heroine.

Alan Sillitoe's *The Death of Bill Posters* finds its title in the familiar warning, "post no bills." The warning symbolizes for the novel's rebellious workingman hero, Frank Dawley, everything that he hates about England. Expressing his rebellion by precipitately leaving his wife, he takes to the road, has brief affairs with two married women, and embarks for North Africa. He is last seen with a radical American girl, as they plan to run ammunition across the Morocco-Algeria border. Although there are passages of acute and persuasive observations of personal relations, the style is uncontrolled and pretentious, and the reworking of the threadbare angry young man theme is almost a parody.

On less serious themes, William Trevor's *The Boarding House* furnishes an example of black comedy. Like his first novel, *The Old Boys*, it draws its characters from the aging or the aged, but the denizens of the doomed boarding house are even more eccentric and unattractive than the old-school-tie boys of the earlier novel. Moreover, the tone of the new work is so cool that one can not be sure that Trevor did not intend to be cruel rather than sympathetic with his characters.

There is no doubt as to the intention of Malcolm Bradbury's *Stepping Westward*, perhaps the most

DRAMATISTS Harold Pinter (left) and John Osborne provided the London stage with its two sensations of 1965: *The Homecoming* (Pinter) and *A Patriot for Me* (Osborne).

amusing novel of the year. Its theme, paralleling closely that of Kingsley Amis' *One Fat Englishman*, exposes an Englishman to the horrors of American academic life. But Bradbury's hero, a liberal-minded declining novelist, is more attractive than Amis' hero, and his unintentional emergence as a champion of academic freedom makes him worthy of more serious consideration.

The first novel enthusiastically greeted in both England and America was *A Green Tree in Gedde* by a young Scot, Alan Sharp. The first of a proposed trilogy, it has three major male characters. John Moseby, vaguely dissatisfied with his marriage, indulges in a sordid love affair, but returns to his wife. Harry Gibbon, cast adrift by his friend Moseby's marriage, has doubts about his own erotic orientation. Peter Cuffee, whom Gibbon has come to know in the army, is unhappily involved in his incestuous love for his sister, Ruth. Gibbon and Cuffee take off for the Continent; there, Gibbon assures himself as to his basic heterosexuality, but Cuffee returns uncertainly to his sister. Sharp renders settings with poetic vividness and is good at conversation, but some critics believed his style was marred by unnecessary Joycean neologisms.

Drama. The theatrical season was highlighted by two sensational plays, John Osborne's *A Patriot for Me* and Harold Pinter's *The Homecoming*. The title of Osborne's play comes from a remark by the Austrian emperor Franz Joseph: "Ah! But is he a patriot for me?" Its subject is the career of Col. Alfred Redl, an intelligence officer in the Austro-Hungarian Army in the early years of the 20th century. Redl slowly discovers his homosexual urges and yields to them. He is blackmailed by the Russians into betraying his country's secrets, and, when discovered, is allowed to shoot himself. Osborne's forthright treatment of his subject and his inclusion of a spectacular scene of a transvestite ball led to the play's prohibition from the public stage. It is unclear whether or not Osborne saw his hero as another rebel victimized by conventional society.

Pinter's *The Homecoming*, his first full-length play since *The Caretaker*, proved to be comedy of the blackest dye. In a characteristically stark setting and in clipped cryptic dialogue, Pinter shows the effect on a father and his two sons of the return of a son who has escaped from their sordidness into American academic life. It soon becomes evident that his American wife is willing, after her husband's disturbed departure, not only to satisfy the brothers' sexual needs but to help support them by her earnings as a prostitute.

More normal and healthily robust is John Arden's play, *Armstrong's Last Goodnight*, first produced by the Glasgow Circle at the Edinburgh Festival and revived at Chichester. The struggle is between Armstrong, an independent border chieftain of the 16th century, and Sir David Lindsay, the emissary of Scotland's James V. It ends with the trapping and death of the unyielding Armstrong.

David Mercer's and Henry Livings' avant-garde plays also attracted critical attention. Mercer's *Ride a Cock Horse* raises to the fourth power the theme of the angry young man. Its hero, an aspiring Yorkshire novelist, is shown in violent and abusive relations with his wife and two mistresses, who answer him in kind. In the end, the hero collapses into psychological infantilism. Livings' *Eh?* is an extravagant farce that owes some of its manner to Ionesco. Its theme is man against machine; its scene, a boiler-room; and its hero, a man who at-

tempts to make for himself and his wife a decent life in the presence of the underground manmade monster that he submissively tends.

Poetry. Perhaps the most memorable poetic event of 1965 will prove to be the publication of *The Complete Poems* of D.H. Lawrence, 35 years after his death. Edited by Vivian de Sola Pinto and F. Warren Roberts, it includes hitherto unpublished poems and significant variants. This definitive edition inspired numerous efforts to evaluate Lawrence's poetry. The evaluations made it clear that, while the poems contain a great deal of dross, they also have a treasurable amount of pure gold.

Robin Skelton's edition of the *Collected Poems of David Gascoyne* gave readers and critics an opportunity to reconsider the gifts of a poet who worked in a mode alien to currently popular styles. Gascoyne's poems blend surrealism and adumbrations from "the racial unconscious."

Robert Graves' publishers marked his 70th birthday by bringing out his *Collected Poems, 1965 and Love Respelt*. The latter reproduces the manuscript of a group of his newest poems.

One critic characterized W.H. Auden's *About the House* as a "self-portrait of the artist as a growly uncle." Although some readers were put off by Auden's self-indulgent playfulness, others saw in the book an expression of the point of view and way of life of a highly intelligent and undeceived but compassionate man of middle age. Some of the characteristics of middle age are also evident in Roy Fuller's *Buff*, which takes its name from a game of forfeits. In this characteristically low-toned volume, perhaps the most impressive poems are the series *To X*, an account of a brief and unexpected love affair with a married woman. D.J. Enright's *The Old Adam* brought no surprises but offered renewed evidence of his honest deflationary reactions to alien customs and attitudes.

John Wain's *Wildtrack*, the year's most ambitious long poem, plays variations on the theme of human interdependence in styles that range disconcertingly from the solemn to the flippant. Much less ambitiously, Ted Walker's *The Fox on a Barn Door* suggests the influence of Ted Hughes. It courageously confronts the brutal and corrosive effects of nature in a vividly evoked no-man's land between ocean and shore. Alan Ross' *North from Sicily* moves rather uneasily from fairly traditional celebrations of Italy's art treasures to poems on the grubby aspects of foreign travels and reports of coolly experienced sexual encounters.

Biography. The biographies and autobiographies of 1965 were few but choice. Lord David Cecil's authorized biography of Max Beerbohm, *Max: A Biography*, deals sympathetically with its subject. Janet Adam Smith's *John Buchan* strikes a happy balance between her subject's drive toward a successful political career and his immense success as a writer of popular historical novels and suspense stories. *James Stephens: His Work and an Account of His Life*, by Hilary Pyle, tries to clear up Stephens' mystifications about his birth and origin. It estimates judiciously the work of a poet with a slight but delightful gift. In *Sean O'Casey: The Man I Knew*, Gabriel Fallon recounts in rich regional detail the friendship of their early years in Ireland and their subsequent break.

Of the autobiographies, Dame Edith Sitwell's posthumous *Taken Care Of* evoked widely divergent responses. Not so much a coherent narrative as a scrapbook assembled during her final illness, the

book gives the macabre impression of a voice from the grave, extolling her friends and annihilating with intertemperate but undeniable wit her critics and persons she disliked. Sir Compton Mackenzie's *My Life and Times: Octave Four, 1907-1915* tells zestfully of the writing and great success of *Sinister Street*, and presents a gallery of vivid portraits of the major literary figures of the time. *Vive Moi!*, the autobiography of Sean O'Faolain, traces his rise from humble Irish beginnings through his involvement in the Irish revolution, his fortunate years at Harvard University, and his gradual discovery of his talent as a writer of distinguished stories and novels.

Emeritus Professor of English
Wesleyan University

ENVIRONMENTAL SCIENCE SERVICES ADMINISTRATION

On July 13, 1965, by order of President Johnson, the Coast and Geodetic Survey and the Weather Bureau were combined to form the Environmental Science Services Administration (ESSA), a new agency in the Department of Commerce. In October 1965, by directive of the secretary of commerce, the National Bureau of Standards' Central Radio Propagation Laboratory also became part of ESSA. This consolidation, concentrating in a single agency the Department of Commerce's geophysical investigation of the earth, oceans, atmosphere, and space, ensures a greater degree of cohesion in the environmental science work of the federal government.

ESSA will observe, collect, process, and disseminate comprehensive data pertaining to the oceans and inland waters, the lower and upper atmosphere, and space, including predictions of what the future holds in these areas. The agency also will combine existing warning systems for tornadoes, hurricanes, seismic sea waves, and floods into a single system, with a common communications network for transmitting warnings to local or regional offices.

Other ESSA programs include the operation of data repositories for the environmental sciences, the preparation of nautical and aeronautical charts, and exploring means by which environmental phenomena can be modified and controlled. In addition, ESSA will conduct research and develop programs to support present and future missions of other government agencies.

ESSA retains the broad capabilities of each participating bureau, enabling it to apply wide personnel and equipment resources, including satellites, ships, aircraft, and electronic computers, to the nation's environmental science service needs. Weather satellites will be used for multiple geophysical observation. Ocean survey ships will be used by meteorologists studying air-sea interaction. Large computer facilities will be used to predict oceanic conditions, to forecast conditions in the space environment, and to conduct other important geophysical programs.

The new agency operates as a unit within the Office of the Assistant Secretary of Commerce for Science and Technology. Dr. Robert M. White, former Weather Bureau chief, was appointed administrator of the Environmental Science Services Administration. Vice Admiral H. Arnold Karo, former director of the Coast and Geodetic Survey, became deputy administrator. The administration has five service and research organizations: the Weather Bu-

reau; the Coast and Geodetic Survey; the Environmental Data Service; the National Environmental Satellite Center; and the Institutes for Environmental Research.

ROBERT M. WHITE
Administrator

EPISCOPAL CHURCH

The year 1965 began amid scenes of pageantry. On January 27, in the National Cathedral in Washington, D.C., the Rt. Rev. John E. Hines, formerly bishop of Texas, was installed as presiding bishop. His two immediate predecessors in office, Arthur Lichtenberger and Henry Knox Sherrill, took part in the solemnities.

Immediately following the installation, the Mutual Responsibility Commission held its organizational meeting. The commission is charged with restructuring the church's affairs to adapt it to a rapidly changing world and to fulfill its mission, in concert with the 18 other regional and national churches of the Anglican Communion. As part of a program to strengthen every part of the communion, the Episcopal Church committed itself to extrabudgetary projects amounting to \$1 million in 1965, and a total of \$6 million over the triennium ending in 1967.

The church's Executive Council operated on a budget of \$13 million (the largest in history) to meet the regular commitments of the church. The program was administered under guidelines laid down by the General Convention, with priority given to overseas missions (particularly in Latin America), urban missions (emphasizing experimental approaches to the problems of rapid urbanization), and aid to theological education.

Ecumenically, the church intensified theological consultations with Eastern Orthodox leaders and held exploratory meetings with Roman Catholics in order to reduce areas of tension and enlarge spheres of cooperation and understanding. The most significant dialogue, known as the Consultation on Church Union (with representatives from the Presbyterian, United, Episcopal, Methodist, Evangelical United Brethren, and Disciples of Christ churches) has been working toward an eventual United Church which will be "truly Catholic, truly evangelical, and truly reformed."

Civil rights continued to engage much of the energies of the church. The Executive Council, in February, reaffirmed its unequivocal commitment to the movement, and many churchmen were prominent participants in the Selma (Ala.) "freedom march" and other civil rights activities. The church also is thoroughly involved in the Delta project in Mississippi. Jonathan M. Daniels, a 26-year old seminarian from Keene, N.H., who was shot in Hayneville, Ala., on Aug. 20, while aiding in the Negro voter drive, became the first Episcopal martyr to the cause of civil rights.

In April the presiding bishop, in solemn ceremonies in São Paulo, relinquished jurisdiction over the church's three Overseas Missionary Districts in Brazil, and the Episcopal Church of Brazil came into existence as the 19th self-governing province of the worldwide Anglican Communion. It was the first such province to be created entirely out of missionary dioceses of the American Episcopal Church.

Episcopal Church Center

ERHARD, Ludwig

Chancellor of West Germany: b. Fürth, Bavaria, Feb. 4, 1897.

Erhard was reelected chancellor of West Germany in 1965 after his Christian Democratic Union-Christian Social Union won a plurality in elections to the Bundestag (lower house of parliament) in September. During the year, Erhard took an active role in foreign affairs, meeting twice with French President Charles de Gaulle and twice with U.S. President Lyndon Johnson.

Elections. In the September 19 elections, Erhard's Christian Democratic Union (CDU) and its Bavarian sister party, the Christian Social Union (CSU), won 47.6% of the total vote and gained 243 of the Bundestag's 492 seats. Backed by a coalition that included the CDU-CSU and the Free Democratic party (48 seats), Erhard was reelected chancellor when the Bundestag convened on October 20. His cabinet, which included Erich Mende, leader of the Free Democrats, as vice chancellor and minister of internal affairs, was approved by the Bundestag on October 26.

Foreign Relations. Under the terms of the 1963 Franco-German cooperation agreement, which calls for semiannual meetings between French and German heads of state, Erhard conferred with French President Charles de Gaulle on January 9 to 10, near Paris, and from June 11 to 12, in Bonn. They discussed their policies on the Common Market and western European unification, the political unification of West and East Germany, and West Germany's role in the nuclear defense of the West. Although the talks did not produce conclusive agreement on issues, both leaders indicated that they had been fruitful.

In talks with President Johnson in Washington, D.C., on June 4 and December 19, Erhard received assurances that the United States would continue to defend western Europe and to support West German efforts to bring about the political unification of Germany. Johnson and Erhard discussed the crisis in the Atlantic alliance, but announced no decision on a policy to improve the situation.

In January 1965, Erhard precipitated a crisis in

CHANCELLOR ERHARD talks to reporters on Sept. 19, 1965, after his CDU-CSU coalition won Bundestag elections.

West Germany's relations with several Arab states when he announced that he had authorized the shipment of \$80 million worth of arms to Israel. The shipments were halted in February after the United Arab Republic threatened to sever diplomatic relations with West Germany if the military assistance to Israel did not cease. A break in diplomatic relations between the two nations came a few months later, however, when West Germany decided to grant diplomatic recognition to the government of Israel. (See GERMANY.)

Background. After receiving a doctorate in economics from the University of Frankfurt in 1928, Erhard worked for a government-sponsored market research agency in Nürnberg. He had become director of the agency by 1942, when he was dismissed after refusing to join a Nazi organization. After World War II, as economic director of the Anglo-American occupation zone, Erhard was able to put into effect the policies that were responsible for the postwar German "economic miracle." He served in the first postwar Bundestag and in Chancellor Konrad Adenauer's cabinet as minister of economic affairs. He succeeded Adenauer as chancellor in 1963.

ESTONIA. See UNION OF SOVIET SOCIALIST REPUBLICS.

ETHIOPIA

The state visit of Queen Elizabeth II of England overshadowed the events in Ethiopia during 1965. News of a different sort was made when Ethiopia's former ambassador to the United States was accused of embezzling embassy funds.

Royal Visitors. Queen Elizabeth and her husband, Prince Philip, Duke of Edinburgh, arrived by air in Ethiopia's capital, Addis Ababa, on February 1 for an eight-day state visit. This was the first time a reigning British monarch had visited the country. The queen was returning the courtesy of Emperor Haile Selassie's visit to Britain in 1954.

The royal couple was conducted through admiring throngs and triumphal arches to the emperor's Jubilee Palace. Subsequently, they visited breathtaking Tisisat Falls at Bahar Dar on the southeast tip of Lake Tana; flew to Gondar, Ethiopia's former capital, to see the castle of Fasilides and the grave of British consul Walter Plowden; spent a night under canvas at Amba Giorghuis; and proceeded to Aksum, the ancient seat of Christianity in Ethiopia.

Diplomatic Scandal. In April the Ethiopian ambassador to the United States, Birhanu Dinke, resigned his post and exiled himself to the United States to protest "oppressive rule" in Ethiopia. On June 14, Ethiopian embassy officials accused the former ambassador of having misappropriated \$20,000 of the embassy's funds prior to his resignation. Dinke publicly denied the charge and asserted that he had sought a change of status in order to

EMPEROR HAILE SELASSIE I (seated, center) entertains royal visitors at a banquet in Addis Ababa on February 1. Queen Elizabeth II and Prince Philip of Britain paid an 8-day visit to Ethiopia, February 1-8.

ETHIOPIA • Information Highlights

Area: 457,266 square miles.

Population: 22,200,000 (July 1, 1964 est.).

Chief Cities: Addis Ababa, the capital, 504,900 (1964); Asmara, 120,000 (1963); Dessie, 56,400 (1963); Harar, 42,700 (1963).

Government: Emperor—Haile Selassie I (b. 1891; crowned king 1928, emperor 1930); Premier—Tsafray Tizaz Aklilou Abde Wold (took office April 17, 1961); Parliament—Chamber of Deputies, 251 members (elected); Senate, 120 members (appointed).

Religious Faiths: Ethiopian Orthodox, 90% of population; Roman Catholics, 0.6%.

Education: Literacy rate (1963)—5% of population. Total school enrollment (1962)—303,842 (primary, 288,499; secondary, 9,440; teacher-training, 1,675; technical, 3,187; higher, 1,041).

Finance (1964-65 est.): Revenues, \$134,760,000; expenditures, \$143,440,000; monetary unit, Ethiopian dollar (2.50 dollars equal U.S.\$1).

Agricultural Production Index (1964): 128 (1956-57=100).

Manufacturing (metric tons, 1963): Sugar, 59,000; cement (1964), 44,000; wheat flour, 23,000; cotton yarn, 5,500.

Crops (metric tons, 1964-65 crop year): Coffee, 93,000

(ranks 10th among world producers); barley, 778,000; maize, 714,000; chick peas, 168,000; dry peas, 115,000; lentils, 94,000; dry beans, 105,000; linseed (1963-64), 52,000.

Minerals (metric tons, 1964): Salt, 263,000; feldspar, 9,957; lime, 6,400; manganese (1962), 6,000; gold, 27,300 troy ounces; platinum, 180 troy ounces.

Foreign Trade (1964): Exports, \$105,000,000 (chief exports: coffee, \$63,560,000; oilseeds, \$10,640,000; hides and skins, \$8,600,000; cereals, \$5,640,000); imports, \$123,000,000 (chief imports, 1963: textile yarn, fabrics, \$16,628,000; transport equipment, \$14,808,000; nonelectrical machinery, \$14,346,000). Chief trading partners (1963): U.S. (took 38% of exports, supplied 12% of imports); Italy (took 9% of exports, supplied 16% of imports); Japan (took 4% of exports, supplied 14% of imports).

Transportation: Roads (1964), 14,292 miles (839 paved); motor vehicles (1964), 21,991 (automobiles, 15,399); railways (1963), 430 miles; merchant vessels (1964), 3 (4,000 gross registered tons); national airline, Ethiopian Air Lines; principal airports—Addis Ababa, Asmara.

Communications: Telephones (1964), 17,865; radios (1962), 150,000; newspapers (1963), 10.

organize an Ethiopian citizen's council for the purpose of bringing democracy to his country.

Economy. The Ethiopian budget for the fiscal year ending July 7, 1966, provides for (in Ethiopian dollars) expenditures of E\$449 million and revenues of E\$298 million. The deficit of E\$151 million was about 43% greater than the estimated deficit for the 1965 fiscal year. Most of the new deficit is to be financed by foreign assistance of various kinds. Both current and capital expenditures will be higher in fiscal 1966 than in fiscal 1965. National defense outlays are scheduled to rise to E\$100 million from E\$75 million in fiscal 1965; Ministry of Interior expenditures, to E\$78 million from E\$60 million; and Ministry of Education outlays, to E\$52 million from E\$48 million. As usual, most of the revenues will be derived from

customs duties and indirect taxes. Direct taxes are expected to yield about E\$60 million of the total.

Foreign Aid. In March the World Bank granted Ethiopia a \$6 million loan, repayable in 20 years, for further improvement of the country's telecommunications network. In June a new two-year United States-Ethiopian economic development program was announced. The loan of \$39.2 million is intended to strengthen Ethiopia's financial resources, to furnish the country with a broad range of essential commodities, and to generate local currency. Bulgaria also extended aid in the form of a \$5 million loan for joint Bulgarian-Ethiopian enterprises to grow cotton, grain, and other crops, to process meat, and to produce pharmaceuticals.

THE 20TH ANNIVERSARY OF VICTORY IN EUROPE is celebrated in Paris on May 8 with a display of fireworks, ending several days of commemorative activities.

EUROPE

There was something of a paradox in Europe in 1965. So far as individual states were concerned, stability and prosperity were the order of the day. On the other hand, progress in western Europe in matters of international economic and political integration came to a standstill. There was even fear that ground already won might be lost.

Western Europe. The continent's long-sustained economic boom continued, and economic forecasters, who were fairly cautious in their predictions at the beginning of 1965, regained their confidence in the later months. Even in Italy, where the economy had experienced considerable difficulties in 1963 and 1964, there was a distinct production upswing in some industries. Elsewhere, Europe's economic problems were limited largely to a chronic labor shortage and the threat of inflation, especially in West Germany.

Europe continued to be politically stable. In Britain, Prime Minister Harold Wilson's Labour government, despite a precarious parliamentary majority, enjoyed remarkable popular support in late 1965, according to British public opinion polls. The Conservative party's new leader, replacing Sir Alec Douglas-Home, was Edward Heath, who had been Britain's chief negotiator in its attempts to join the European Economic Community. He was unable to make any immediate improvement in his party's position in relation to the Labour government. The British government made an unusual approach to Europe by holding discussions on April 24-25 at Chequers, the residence of the prime minister in Buckinghamshire, England, among 20 representatives of the Socialist parties of 13 countries—the six states of the European Economic Community (the "Inner Six") and the seven members of the European Free Trade Association (the "Outer Seven").

Hostility between the two parts of Ireland seemed

to lessen in 1965, with the prime ministers of Northern Ireland and of the Irish Republic meeting for the first time. On January 14, Sean Lemass, prime minister of the Republic of Ireland, paid a friendly visit to Stormont Castle, the residence of Northern Ireland's prime minister, Terence M. O'Neill.

In West Germany, in a political race that observers had expected would be close, the general election of September 19 resulted in an easy victory for Chancellor Ludwig Erhard's Christian Democratic party. The state visit of Queen Elizabeth II to West Germany, including West Berlin, from May 18 to 28, was a notable landmark in the effacing of old enmities. The queen's visit was universally popular in Germany, but less so in Britain.

In France, President Charles de Gaulle continued to dominate the political scene and apparently to command general popular support. Premier Francisco Franco in Spain and Premier António Salazar in Portugal were able to relax certain government controls, with press censorship being abolished in Spain and moderated in Portugal.

Perhaps the most disturbed state of Europe was Greece, where a political dispute between King Constantine and Prime Minister George Papandreu led to a crisis that lasted for months. Not until the end of September was the king able to find, in Prime Minister Stephan Stephanopoulos, a man who could command a parliamentary majority.

Eastern Europe. The regimes in eastern Europe remained Communist. Germany continued to be divided into two political units, and the common fear of Germany among other European countries remained strong. Nevertheless, with some variation from country to country, the eastern European countries were experiencing both an improvement in the material things of life and a new and more hopeful spirit. There was increased commerce and increased cultural exchange between eastern and western

Europe, and it seemed possible that political change might eventually ensue. (See also COMMUNISM.)

European Integration. The great negative aspect of Europe in 1965 was the deadly effect exercised by French intransigence on the development of western European international organizations. French policy proceeded on an increasingly independent course. At midyear, France withdrew from participation in the European Economic Community, thus preventing both the adoption of new policies and the continuation of existing integration negotiations. President de Gaulle, who dislikes the whole idea of supranational institutions and the growing influence of the civil servants of the European institutions, seemed determined to conduct negotiations on a government-to-government basis rather than through the machinery of the European organizations. The result was that there was no real progress toward European integration in 1965, and real fear that integration trends might have been reversed.

THE THREE FUNCTIONAL COMMUNITIES

The members of Europe's foremost economic organizations—the European Economic Community (Common Market), the European Coal and Steel Community (ECSC), and the European Atomic Energy Community (Euratom)—are the same six nations: France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg. These organizations have for some years been more important forces for European integration than have European political organizations. It was against these economic groups that negative French policy in 1965 was most effective.

European Economic Community (Common Market). The year appeared to begin auspiciously for the EEC. On January 1, in accordance with the provisions of the 1957 Treaty of Rome, there was a new 10% reduction in customs duties on trade within the Common Market. Customs duties on industrial products were decreased to 30% of the base level of 1957. Duties on some agricultural products were lowered to 50% of 1957 levels, and on others to 45%.

More significantly, the proposal for merging the executive bodies of the three communities that had been discussed for two years was adopted. On April 8 in Brussels, Belgium, the six nations signed a treaty creating the Council of Ministers and the Commission for the three European economic communities, thus fusing the commissions of the EEC

and Euratom with the High Authority of ECSC. For an interim period the new joint commission will consist of 14 members; thereafter it will consist permanently of 9. Its seat will be in Brussels, although some offices will be located in Luxembourg. The treaty was to enter into force one month after all six states had ratified it. By the end of 1965, three countries had done so.

This administrative change and the whole future of the communities came into question as a result of the events of the summer. On Dec. 15, 1964, the EEC Council of Ministers had agreed on common prices for cereal products. However, they failed to agree in the spring of 1965 on proposals put forward by the commission for financing the common agricultural policy and on other matters. This dispute, in which right was not all on one side, was complicated. The French insisted that the member states should continue to subsidize the Community's agricultural policy until 1970. While this would benefit France principally, the French regarded it as reasonable compensation for allowing the other states (notably West Germany) to sell their manufactured goods freely on the French market. The EEC commission further complicated the issue with its overingenious proposal that all agricultural revenues should accrue directly to the Community after July 1, 1967. The proposal would have the effect of giving the Community a tax revenue of its own, and, as expected, France would not agree to it. Another proposal, supported by West Germany, would give the European parliament (the assembly of the six EEC members) a greatly increased voice in the control of Common Market revenues.

The transitional provisions regarding financing of the common agricultural policy were due to expire on June 30, 1965. A meeting of the Council of Ministers in Brussels, June 29–30, proved unable either to make new provisions before the deadline or to agree on a procedure for extending the deadline. The French foreign minister, Maurice Couve de Murville, said that a commitment to make a new financial regulation of the agricultural fund by June 30 had been broken and that it was not possible to continue the negotiation. France's minister of information, Alain Peyrefitte, said that the French government had decided to "draw the political, economic, and juridical consequences of the situation now created."

Subsequent to June 30, France adopted an "empty chair" policy toward the Community, participating in none of its meetings except some minor technical ones. The council met briefly without France on July 26. On October 14, French Premier Georges Pompidou indicated that the crisis could be ended only on French terms, and in any event not before the French presidential election of December 5. In all previous cases where France had brought heavy pressure to bear, her five partners had backed down, but there was no indication that this would happen in regard to this issue. West German Chancellor Erhard, in particular, seemed prepared to act firmly.

Negotiations for establishing special relations between the EEC and Austria, Nigeria, Tunisia, and Morocco made rapid progress in the first half of the year but, like other discussions, were suspended in the second half.

The European Coal and Steel Community (ECSC). Demand for coal and coal products continued to decline within the Community, and even steel products leveled off in 1965. The ECSC's investment survey, (Continued on page 268)

EUROPE

The progress of European integration and difficulties within the Atlantic partnership, troubles with colonial territories, threats to internal and external peace and stability, national rivalries and nationalistic ambitions, and religious harmony and cooperation occupied the attention of much of Europe in 1965. The year ended with France refusing to take a full part as a Common Market member, NATO under fire from several directions, and the reunification of Germany only a hope.

IN ATHENS, DEMONSTRATORS on July 19 demand the return to power of ousted Greek Premier George Papandreou.

published in July, noted that capital expenditure in the ECSC coal, iron ore, and steel industries continued to decline in 1965 and might be expected to decline further in 1966. This was attributed to the completion of major 1960-61 investment plans and to the effect of gradually decreasing coal output. Coal mining capacity is expected to decrease between 1964 and 1968 in almost all of the Community's coal fields, except for possible minor increases in the Sulcis region of Sardinia and in Aachen, Germany. Output in the Lorraine region of France is expected to remain stable.

The High Authority of the ECSC concluded in March an agreement with a German banking syndicate to float a \$37.5 million loan on the German capital market. This was the largest High Authority loan thus far raised on a single European market, and it brought the High Authority's total borrowing since 1952 to \$542 million.

European Atomic Energy Community (Euratom). The Euratom Council of Ministers, on May 13 in Brussels, unanimously approved a modification of the Community's research program for the five-year period 1963-67. The modification places greater emphasis on the Orgel project (Orgel is the European name for an advanced type of heavy-water reactor consuming natural uranium as fuel), and Euratom's joint research center. Until 1965, the center consisted of three establishments located at Ispra, Italy; Geel, Belgium; and Petten, the Netherlands. A fourth establishment, the Transuranium Elements Institute, was officially opened on April 6 at Karlsruhe, Germany.

Despite Euratom's concentration in recent years on a research program, the Euratom Commission announced in June that nuclear reactors, which in 1964 provided only 0.8% of the Community's electric power needs, are expected to produce 3% of the Community's total electricity in 1968 and from 8 to 13% by 1975.

POLITICAL ORGANIZATIONS

While the most effective economic organizations in Europe have a membership limited to the Common Market nations, the groups working for political integration are made up of many countries. Britain, effectively blocked by France from membership in the Common Market, is an important member of the Council of Europe and other organizations.

Council of Europe. The fourth part of the 16th ordinary session of the Council of Europe was held at the Council's seat in Strasbourg, France, January 25-29. The proposed political union of Europe was debated, and reports on economic, agricultural, legal,

and social matters were received and discussed. A resolution was adopted on instituting international guarantees for the protection of all the inhabitants in Cyprus. The Assembly agreed to draw up a preliminary report on the prevention of radio broadcasts from floating or airborne stations outside national territories, thus eliminating so-called "pirate radios."

The first part of the 17th session was held May 3-7. The Assembly's debates were once more concerned with matters relating to the political and economic unification of Europe. The most interesting event of the session, as of the year, was the admission of Malta as the 18th member of the consultative, quasi-parliamentary body. Giorgio Borg Olivier, Malta's prime minister, addressed the Assembly on May 4.

The European Social Charter came into force on February 26; its broad purpose is to ensure the equal social rights of the peoples in member countries.

In May, René Cassin, professor of law at the Sorbonne in Paris, succeeded Lord McNair of Britain as president of the European Court of Human Rights.

Western European Union. This seven-member body, comprising the six members of the three functional communities plus Britain, continued its unspectacular activities in 1965. The first part of the 11th session of its Assembly was held in London from May 31 to June 3. Professor Carlo Schmid of Germany, the Assembly president, stressed in his address that the reconciliation between France and West Germany, though fragile, was real and important and that the most significant task remaining was to make Britain an effective member of the European community.

OTHER EUROPEAN ORGANIZATIONS

European Free Trade Association (EFTA). Britain's 15% surcharge on industrial imports, which had been opposed by her EFTA partners when it was imposed as an emergency measure on Oct. 26, 1964, was reduced to 10% on April 26, 1965. At the suggestion of Britain, the meeting of the EFTA Council held in Vienna, Austria, May 24-25, was at the prime ministers level; five premiers were present. The meeting showed great concern with the continued separate evolution of the EEC and the EFTA, and sought means of reversing this trend. The ministers reaffirmed the importance they attach to the Kennedy round of tariff negotiations (see INTERNATIONAL TRADE).

Frank E. Figgures, who had been secretary general of EFTA since its formation in 1960, resigned the post effective Nov. 1, 1965, and was succeeded by Sir John Coulson, of the British foreign office.

Organization for Economic Cooperation and Development (OECD). At the beginning of the year the Council of OECD decided to continue the European Monetary Agreement (EMA). The Council felt that EMA "could usefully assist members whose reserves and quotas in IMF [International Monetary Fund] are small in relation to swings in their balance of payments." On March 30 the Council granted Turkey \$70 million in credits through the European Fund of the EMA, and instituted other measures on a three-year basis to help relieve Turkey's balance-of-payments deficit. FASHION

Youth was the most important influence on fashion in 1965. And the fashion concept of youth echoed the immediacy of "op" art, the modernity of a walk in space, and the "cool" beat of the discothèque. Not since the flapper flourished has fashion so completely renounced past influences and shaped itself to the present.

Silhouette. The dress of the year—an outspoken example of the unconstructed and unconfining silhouette—was the formless shift. In spring the focus shifted to the legs, with skirts swirling and hemlines stopping inches above the knees. An elongated look was achieved by longer jackets, tunics that skimmed the body, and low, loose belts.

Skirts, softened by easier, prettier lines, usually had pockets that looked like giant patches, or that slipped deep into side seams. Side-wrap skirts fell slimly; flared and pleated skirts had fullness that whirled from the hipline.

Necklines for daytime were high, with softened turtlenecks or with collars that were small and tidy-looking, round and rolled, or stand-away. The halter neckline was popular for evening, as was the one-shoulder look. By autumn the after-five neckline

was deeply cut, reaching for the waistline in back and daringly low in front.

Ruffles were the most feminine touch of the year. They curled around the body, rippled down the side of skirts, fell from bodice to hem on dresses, and circled hemlines in deep rows. Smocking was another important detail on yokes and cuffs.

Coats were skinny and cut high under the arms, or frankly huge with dolman or bat-wing sleeves. Lengths ranged from above the knee to almost ankle length for the greatcoat.

Fabrics. Spring brought richly textured fabrics, and many kinds of prints. Geometric prints, especially "op" art patterns were very popular.

For fall, outstanding fabrics included milkweed tweeds, heathers in rich shades, and huge blurred plaids and checks. Velvet and yarn were woven together, and Panne velvets that resembled fur were used. Double worsteds, ottomans, ribbed silks, four-crepes, and georgettes added texture.

Through the holidays, quilted cotton and wool were found in every price range, and twills, paisleys, printed wools, challis, melton cloth, sparkle-woven tweed, and silks added to the glitter. Lace and lacy knits were worn for both day and evening.

There was a renewed interest during the year in suede and suede cloth. The "real" suede coat became an important item. Often it was lined with real fur. Fur, in fact, reached a new high in popularity. It appeared everywhere, from coat linings to lounging pajamas. Fur dresses and skirts were matched with fur coats and fur hats.

Color. Color for spring went white—stark, bone, creamy. Pastels were bright, and bold black and white prints were popular. There also was a bouquet of marigold colors ranging from beiges to brilliant yellows and oranges. Pinks were shaded,

like seashells or coral reefs, and green was important in every hue.

In general, colors were brilliant for fall, with blue emerging as the color of the year. It went from baby blue to Bristol, and was used in everything from day dresses to regal evening gowns.

Sportswear. Sportswear continued to be an important influence on all areas of fashion. Matching heathers (cross-dyes of color with white) dominated the "total look" in which everything was matched or coordinated. Patterned or solid-color stockings were coordinated with caps, scarves, sweaters, skirts, and coats.

The influence of the West made blue jeans and hipster pants popular. Waists rode low on the hips, and skirt lengths were high above the knee. Heeled boots were worn with everything. There was a nautical feeling in bell-bottom pants and pea jackets. Straight or A-line shifts and jumpers were prominent for street and school wear.

Shetland was preferred over mohair for sweaters. The "poor boy," a close fitting, narrow-rib knit, was the most popular sweater style of the year. Other sweaters had bulky turtlenecks or loose crochet weaves, and see-through knits lined in matching silks or cotton.

Most bathing suits were two-piece, cut low below the waist. One-piece suits were cut out at the midriff, or overlaid with net.

"Pants suits"—slacks combined with matching jackets—were worn for plane travel and in the city. Elaborate evening pants and pajamas were worn at home, as well as at the theater and for formal occasions.

Accessories. Hosiery became the fashion focal point as skirt lengths rose. Textured stockings in many colors and patterns were important.

KEYSTONE

PANTS SUITS BY JACQUES ESTEREL have the popular bell-bottom trousers, and are worn with coordinated coats and matching hats.

Hats became more important in 1965. New shapes included bandanna and scarf hats; helmets, often with visors; canoe shapes; tilting brims; shaped squares with chin ties. Black patent was used for berets, boaters, and bretons. Feathered hats were prominent for evening, and fur in a variety of shapes was worn with everything.

Shoes were light, with a little-girl look. Sling backs were important the year round. Mary Janes in bright colors featured buckles or ribbon ties. There were T-straps, button straps, and ankle straps. Shoes were generally low-heeled, especially when designed to be worn with textured stockings. Boots, from indoor shoe boots to hip-length sport boots, flooded the market in every price range.

Bags were smaller in size and more compact. Shoulder bags made a comeback.

Jewelry was generally big and chunky. There was an exotic feeling in serpent bracelets designed with multicolored stones, tasseled ropes and chains, and hanging earrings. Rings were huge and elaborate.

Children's Clothes. Children's clothes for 1965 were strongly influenced by the youth trend in adult fashion. Particularly important were contrasting pipings, architectural shaping, and short white boots. A new British feeling was expressed in "Mod" smocks, plaids, challis party dresses edged with lace, and granny knits.

A traditional look was reflected in the revival of heather tweeds, especially for boys, and in Irish and Shetland sweaters. Prints in the "pop" and "op" mode, patterned socks, and newly rugged sports clothes rounded out the picture.

FEDERAL BUREAU OF INVESTIGATION

The Federal Bureau of Investigation (FBI), established in 1908 as the investigative branch of the U.S. Department of Justice, investigates violations of federal laws, except those assigned to other federal agencies. The bureau has jurisdiction over some 170 investigative matters, in both the general criminal and the internal security fields.

Work of the FBI increased substantially between July 1, 1964, and June 30, 1965. Convictions exceeded 13,000. Fines, savings, and recoveries totaled \$235,171,542. During these 12 months the bureau located 13,491 fugitives, including about 3,300 violators of the Fugitive Felon Act, and apprehended 18 dangerous felons on the FBI's "Ten Most Wanted Fugitives" list.

Under provisions of the Civil Rights Act of 1964, the FBI investigated 1,500 cases relating to discrimination in places of public accommodation, facilities, and education. Within 24 hours of the murder of Mrs. Viola Liuzzo in Alabama on March 25, 1965, the FBI had made arrests on the basis of federal violations in connection with this crime.

In fiscal 1965 the FBI made significant strides in combating large-scale criminal activities. Convictions under the three antigambling statutes passed by Congress in the fall of 1961 rose more than 60% over fiscal year 1964. In the internal security field, five Soviet diplomats were declared persona non grata, and undesirable and dangerous aliens were excluded or deported from the United States as a result of information supplied by the FBI to interested government agencies.

Cooperative services to other law-enforcement agencies in fiscal 1965 included 276,383 examinations by the FBI Laboratory, involving 205,141 specimens of evidence. The Identification Division, national repository for fingerprint data, received an average of over 23,000 fingerprint cards each working day. At the conclusion of the fiscal year, the Identification Division files contained 175,246,960 sets of fingerprints representing almost 79 million persons.

The FBI National Academy graduated 194 law-enforcement officers in 1965. This brings the total number of graduates to 4,740.

FEDERAL POWER COMMISSION

A massive power blackout that struck the northeastern United States, including New York City, and parts of Canada on Nov. 9, 1965, prompted a study by the Federal Power Commission (FPC) that led to the release of the first tentative recommendations on December 6.

"Measures have already been taken," the initial report said, "to prevent the same relays [at the Sir Adam Beck II generating plant at Queenston, Ont.] from triggering another power failure." In domino effect, the blackout had spread through companies tied in to the Canada-United States-Eastern Interconnector grid and quickly covered 80,000 square miles. The FPC report said: "The power companies were interconnected . . . but it is apparent that the systems were not operating as a true power pool, that is, a fully integrated network. . . . There can be no absolute assurance that outages of the Novem-

ber 9 magnitude will not recur. On the other hand, there is no apparent reason why operating equipment and techniques cannot be improved to the point where the likelihood of recurrence would be so remote that it would not constitute a major worry to either the industry or the public."

The FPC's National Power Survey report, issued in December 1964, brought a sharpened awareness throughout the electric power industry of the desirability of power pooling as a means of economizing on production costs. This report contained a broad outline for a nationwide interconnected and coordinated power supply system. It also pointed out possible patterns of expansion which by 1980 could result in savings to consumers of as much as \$11 billion annually. The commission plans to update the National Power Survey every three to five years.

The FPC reached a regulatory landmark by establishing a permanent system of gas producer regulation. Its opinion in the Permian Basin area rate case fixed a uniform ceiling price structure applicable to a major producing area. The Permian Basin case and three other area rate proceedings under way in 1965 covered about 75% of the gas sold in interstate commerce by independent producers.

By the end of fiscal 1965 the FPC was current in its natural gas pipeline rate work. Only one pending pipeline rate case, involving a minor increase, remained to be decided as the result of a four-year program to clear away a backlog which in 1960 involved approximately \$1 billion of excess revenues collected subject to refund. Pipeline rate reductions in fiscal year 1965 totaled about \$64 million, and refunds ordered by the FPC totaled \$108 million. Independent producer rate decreases amounted to \$12.3 million during the year, and the FPC ordered producers to make refunds totaling \$32.6 million.

The commission in the fiscal year 1965 authorized 4,894 miles of new natural gas pipeline and 301,210 horsepower in compressor station capacity, at a total estimated cost of \$545.5 million. It also disposed of 3,207 applications by independent producers seeking authority to sell natural gas in interstate commerce.

The FPC processed 2,686 wholesale electric rate filings, and ordered reductions amounting to over \$8 million yearly. It also issued 28 major licenses for hydroelectric power projects having a total initial installed generating capacity of 3,239,945 kilowatts, at a cost of about \$337.4 million.

Commission members as of Sept. 1, 1965, were the following: Joseph C. Swidler, chairman; David S. Black, vice-chairman; Lawrence J. O'Connor, Jr.; Charles R. Ross; and Carl E. Bagge.

JOSEPH C. SWIDLER

Chairman, Federal Power Commission

FEDERAL TRADE COMMISSION

The Federal Trade Commission (FTC) is an independent regulatory agency of the United States government. It was organized in 1915 for the purpose of safeguarding business and the public from unfair methods of business competition and from deception in advertising and selling. It also makes economic studies of problem areas in the nation's economy.

The FTC is composed of five commissioners appointed to staggered seven-year terms by the president and confirmed by the Senate. No more than three of the commissioners may be of the same political party. Paul Rand Dixon has been chairman of the commission since 1961.

By enlightenment and persuasion if possible, and by formal orders if necessary, the FTC takes action to halt monopolistic practices in interstate commerce. Such practices include corporate mergers which endanger competition, discriminatory pricing and advertising allowance arrangements between buyers and sellers, price-fixing conspiracies, illegal brokerage payments, and prohibited resale price maintenance.

In protecting consumers and reputable business from deceptive practices, principally false advertising, the FTC in 1965 concentrated its efforts on exaggerated claims for health products. It gave special emphasis to misleading claims for vitamin-mineral preparations and "cures" for arthritis, overstated savings schemes for food-freezer plans, and high-pressure selling practices for home improvement products and household furniture and equipment. Monitoring of advertising media, including broadcast stations, continued to be closely watched.

By a combination of legal action, persuasion, and industry counselling, the FTC protected consumers by requiring truthful and informative labeling and advertising of wool, fur, and textile fiber products. The commission also acted to protect the public from dangerously flammable wearing apparel.

The FTC's economic studies not only covered particular industries but also explored broad changes in concentration, diversification, and integration in American manufacturing industries. For example, an analysis of merger activity showed that the number of corporate mergers in 1965 was higher than at any time during the past 30 years.

The commission also completed the third and final report of its *Economic Inquiry into Food Marketing*. This report on the canned fruit, juice, and vegetable industry examined production and consumption patterns, concentration, and diversification and integration in merger activity. It also reviewed costs, profits, marketing patterns, product promotion, and entry barriers in the industry.

With headquarters in Washington, D.C., the FTC maintains 11 field offices. These are located in New York, Chicago, Cleveland, Boston, Atlanta, Kansas City, New Orleans, San Francisco, Los Angeles, Seattle, and Arlington, Va.

FINLAND

Both the foreign policy and the domestic politics of Finland reflected the country's concern with preserving a neutral stance in the East-West struggle while at the same time maintaining cordial relations with its neighbor, the Soviet Union.

Foreign Relations. President Urho Kekkonen stopped off in Moscow in mid-February on his way back from a state visit to India. In a speech given at the Finnish embassy on February 24, President Kekkonen expressed concern over NATO's proposed mixed-manned nuclear force and West Germany's role in it. He warned that Finland could maintain its neutrality only if peace was preserved in Europe. A flurry of press comment ensued. The *Helsingin Sanomat* asked about Finland's prior pledges that

Chief trading partners (1963): Great Britain (took 21% of exports, supplied 14% of imports); USSR (took 16% of exports, supplied 16% of imports); West Germany (took 12% of exports, supplied 18% of imports).
Transportation: Roads (1964), 42,260 miles (8,026 paved); motor vehicles (1964), 468,212 (automobiles, 385,432); railways (1963), 3,379 miles; merchant vessels (1964), 243 (914,000 gross registered tons); national airlines, Finnair, Kar-Air; principal airport—Helsinki.
Communications: Telephones (1964): 728,785; television sets (1964), 610,000; radios (1963), 1,397,000; newspapers (1960), 64 (daily circulation, 1,597,000).

neutrality would be upheld "in all situations." On the other hand, a Communist paper asserted, "We are aligned. If war breaks out, our interests are the same as the Soviet Union's." Leaders of the coalition government, headed by Johannes Virolainen, vowed that the speech did not reflect a change in Finland's policy of neutrality.

In order to isolate Finland from the great-power struggle and to convince the Soviet Union that an independent Finland posed no threat to it, President Kekkonen reiterated his plan for a Nordic nuclear-free zone to the Communist-controlled World Peace Conference, held at Helsinki in July. The proposal was greeted with enthusiasm.

Domestic Politics. Domestic politics reflected the approach of new parliamentary elections in 1966. The Agrarian party, eager to broaden its image, changed the name of its major paper from *Maakansa* (Rural People) to *Suomenmaa* (Finland) in September, and a month later renamed itself the Center

party. The Finnish People's party and the Liberal League moved toward merger. The Soviet newspaper *Pravda* urged the Social Democrats to work with the Communist-dominated Finnish People's Democratic Union (SKDL) in the coming election. However, the Social Democrats demanded an impossible precondition for such collaboration: that the SKDL publicly reject violence and subscribe to complete freedom of opinion. The Communists did effect a limited electoral alliance in November with the splinter Socialist opposition.

Some observers were concerned by what they considered to be evidences of "Gaullism" in the government. A prominent Swedish People's party leader argued that "the balance of power between the Diet, president, and council of state has been disturbed in an alarming manner." An ineffectual party system was blamed for this lack of balance.

Economic Developments. President Kekkonen told the Diet on February 9: "Our per capita income this year will be about \$1,250. We thus belong among the 20 wealthiest nations. Our situation looks very satisfactory." Economic progress in 1965 was on the whole quite impressive. The gross national product rose by more than 5%, and industrial production by 6%. Work stoppages were few. Prices and wages were relatively stable, due partly to tighter controls on bank loans and installment buying. The cost-of-living index rose by 4% (compared with 10% in 1964).

Some concern was felt over the steady decline in farm and forestry employment. Recent economic expansion has occurred chiefly in sectors involving relatively few laborers. There continue to be pockets of poverty in several regions. For example, on a national income scale of 100, North Karelia's income is only 65.

Foreign trade was up 12% over the 1964 level. This increase included a 24% rise in exports of the metals industry and heavy imports of Western cars. The imbalance of trade, a perennial problem, worsened. Foreign exchange reserves fell sharply, while long-term foreign credits were more difficult to obtain. On March 1, Finland reduced tariffs on industrial imports from the European Free Trade Association countries to 30% of the 1960 level.

In September a budget totaling 7 billion Finnish marks was proposed for 1966, and the government outlined a four-point program to halt excessive growth of public expenditures, strengthen exports, maintain wage-price stability, and modernize the budget system.

Finnish Academy. President Kekkonen questioned the effectiveness of the Finnish Academy, established in 1947. The state appoints 12 distinguished representatives of the arts and sciences to serve on the academy at government expense to promote the development of their own fields of endeavor. Those evaluating the academy are likely to recommend certain reforms rather than the academy's abolition.

FIRES

Fire in the United States in 1965 caused 12,000 deaths and \$1.76 billion in losses (up \$100 million from 1964), a preliminary estimate of the National Fire Protection Association (NFPA) indicated.

Worst Fire. The worst fire tragedy of 1965 oc-

THE NEW YORK TIMES

FIRE destroyed the interior of New York's famous old Church of St. Matthew and St. Timothy on Dec. 1, 1965.

curred August 9 when an explosion and fire killed 53 workmen at a Titan II intercontinental missile silo near Searcy, Ark. The largest single property-loss fire of the year took place January 5 at Eglin Air Force Base, Fla.; the loss from burning of a missile detection and tracking station was estimated at over \$20 million.

1964 Losses. Final NFPA figures for 1964 showed that 2,367,325 fires took 11,900 lives and destroyed \$1,652,700,000 worth of property (down \$135,400,000 from 1963). Fire damage to all buildings and contents totaled \$1,361,500,000 in 1964, \$1,408,500,000 in 1963, and \$1,283,000,000 in 1962.

The worst 1964 fire, in loss of life, occurred on July 9, when an inflight fire caused an airliner to crash near Newport, Tenn., killing 39 persons. The most costly fire was the \$15 million destruction on June 13 of a nuclear submarine under construction at Pascagoula, Miss. The \$7,240,000 fire on December 15 at the Neiman Marcus store in Dallas, Texas, was the most costly building fire.

LARGE-LOSS FIRES IN THE U.S., 1964
(Individual loss of \$250,000 or more)

Classification	Number	Loss
Manufacturing.....	100	\$ 71,338,500

Miscellaneous.....	12	13,361,500
Total.....	386	\$296,508,500

Number of Fires. The NFPA's fire records showed 912,600 building fires in the United States in 1964. The remaining 1,454,725 fires involved aircraft, missiles, and space vehicles (125); motor vehicles

(392,200); forests (127,000); brush, grass, and rubbish (898,700); and miscellaneous (36,700).

Dwelling Fires. In 1964, dwelling fires reached a record 604,100, with \$393,800,000 in losses. Of the 6,550 lives taken, 3,500 were children. The main causes of dwelling fires were careless smoking and defects in electrical and heating and cooking equipment.

National Fire Protection Association

FISHERIES

Since 1962 the oceans and inland waters of the world have yielded an annual catch of over 100 billion pounds of fish and shellfish. In 1964, according to the Food and Agriculture Organization of the United Nations (FAO), the world catch totaled a record 113.8 billion pounds—11% more than in the previous year.

World Fish Catch. Construction of improved fishing vessels, the use of synthetic fibers in fishing gear, the adoption of electronic fish-detection equipment, and the development of fleets of factory ships capable of operating throughout the world contributed to an increase of 150% in the world fish catch between 1948 and 1965—a far more rapid rate of increase than that sustained by the human population. The large stocks of fish and shellfish in the seas and new opportunities for fish farming in inland and coastal waters will permit further large increases in production.

About 20 nations harvest catches of a billion pounds or more each year. In 1964, Peru led with over 20 billion pounds, largely anchovies used to make fish meal and oil. Japan was second, with nearly 14 billion pounds, followed by Communist China, the Soviet Union, and the United States.

Whaling. U.S. whalers in the Pacific took 274 whales worth \$734,000 in 1964, as compared with 259 whales worth \$544,000 in 1963. The International Whaling Commission met in London in June 1965 and halved the quotas for factory ships in the Antarctic, in an effort to preserve breeding stock.

U.S. Fisheries. The total U.S. catch of fish in 1965 was close to the 4.5 billion pounds taken in 1964. However, the volume of the catch was about 300 million pounds less than the average for the previous 10 years, and far below the record 5.4 billion pounds caught in 1962. Prices were up sharply, and fishermen received a record of about \$440 million for the fish and shellfish taken—well above the previous record of \$396 million in 1962.

Species caught in greater volume in 1965 were sea herring in Maine, menhaden in the Gulf of Mexico, red salmon and king crab in Alaska, and shrimp in the South Atlantic and Gulf. Species taken in reduced volume were haddock and ocean perch in New England; sea herring, chum, and pink salmon in Alaska; and jack and Pacific mackerel in California.

The United States leads all other countries in both the volume and value of fishery imports. (The value of its imports is twice that of Britain, the country in second place.) The high U.S. value results from large imports of expensive items, such as fresh and frozen fillets, common and spiny lobsters, shrimp, scallops, and canned sardines, tuna, lobsters, and oysters.

In 1965, imports for the first time provided over half the U.S. supply of edible fish and shellfish.

(Imports of industrial fishery products, consisting principally of fish meal, have exceeded domestic production since 1962.) Foreign sources provided about two thirds of the U.S. supply of groundfish (principally cod, haddock, and ocean perch) and over half the tuna, shrimp, sardines, and fish meal used. Nearly all the supply of lake trout, spiny lobsters, and canned bonito is imported.

HURRICANE BETSY struck Florida in September. Heavy seas and winds washed the Panamanian ship *Amaryllis* ashore at Lake Worth.

MIAMI residents escape from low-lying areas as rising floodwaters caused by the devastating hurricane threaten their homes.

appointees to the Board of State University Regents for those named earlier by outgoing Gov. Farris Bryant. Furthermore, although state cabinet members normally are elected independently of the governor, Burns had the opportunity to fill three cabinet posts.

These factors, coupled with Burns' eligibility to run for reelection in 1966 under a constitutional amendment adopted in 1964, appeared to give the governor unprecedented political power. However, Burns encountered a severe setback on November 2 when the voters rejected his \$300 million highway construction bond proposal, which had been endorsed by the legislature in May. The vote against the bond issue was 425,000 to 275,000.

Legislation. The Legislature met for its regular session in April and May and passed 2,700 laws. It created the office of chancellor of the state university system, authorized a medical school at the University of South Florida in Tampa, approved \$88.5 million for campus construction, and established five junior colleges. It also set up a State Board of Antiquities to regulate treasure hunting along the Florida coast.

A record \$1.1 billion general appropriations bill was passed. Added to expenditures from trust fund accounts, this would increase state spending for 1965-66 to an estimated \$2.6 billion.

The legislature, battling through two special summer sessions, approved a new reapportionment plan which provided for 58 senators and 109 representa-

tives. The plan ended the rule of the small-county bloc, but it still fell short of the "one man, one vote" ruling of the U.S. Supreme Court.

Racial Issues. Florida, a center of national attention in 1964 when racial tensions flared at St. Augustine, was comparatively quiet in 1965, as far as racial issues were concerned. All of the state's 67 counties filed school desegregation plans with the U.S. Department of Health, Education, and Welfare, and about 8,000 Negro students attended previously all-white schools in September.

Weather. Freakish weather caused considerable trouble during the year. A freeze in January hurt vegetable crops, and tornadoes hit eight South Florida communities in February, injuring six persons. Abnormally high tides from Hurricane Betsy damaged the Atlantic coast on September 8, and the Gulf coast on September 9.

Economy. Damage from nature's rampages was more than offset by the continued gain in tourism and industry. The 1964-65 tourist season was by far the state's largest. In November, Walt Disney announced plans to construct a major attraction, "Disneyland East," near Orlando.

The challenge of absorbing the new influx of refugees that began in October following Cuban Premier Castro's decision to let certain Cubans leave their homeland was adequately met by the state's expanding economy. About 9,700 Cuban refugees entered the United States through Miami in 1965.

Education. The state's university and junior college system continued to expand. Private higher education received a major boost with the announcement in November that the late Mrs. T.C. Buckner of Jacksonville had made a bequest estimated at \$7 million to Florida Southern College, a Methodist-affiliated institution at Lakeland.

Florida Southern College

KEYSTONE

FOOD SHORTAGES afflict many countries. Here, children in Chad receive milk from the United Nations.

FOOD SUPPLY

Imbalances between food supply and population created increasingly large problems in vast areas of the world in 1965. Food shortages continued to plague most of the less-developed countries and virtually all of the Communist states of eastern Europe, including the Soviet Union. In contrast, the United States, using advanced agricultural methods, produced abundantly and, under the Food for Peace program, sent abroad sizable quantities of food, including two fifths of the nation's wheat crop.

WORLD FOOD SUPPLY

In 1965, for the seventh consecutive year, world food production failed to gain significantly on population growth. B.R. Sen, director general of the Food and Agricultural Organization of the United Nations, likened the period to the seven lean years referred to in the Bible. Orville L. Freeman, U.S. secretary of agriculture, spoke of the "staggering proportions of the problem facing the less-developed countries in their efforts to keep food production in pace with population growth."

Both India and Communist China, the world's two most populous countries, imported record quantities of grain in 1965. The United States shipped nearly one fifth of its wheat crop to India in an effort to stabilize the country's food prices and avert famine. The 1965 monsoon, arriving late in India, turned out to be the poorest of this century. At the year's end, it was clear that India soon would face the worst food crisis in recent history.

Communist China's record grain imports, consisting mostly of wheat, came largely from Canada and Australia. The Soviet Union, the third most populous country, had a poor harvest in 1965, comparable to that of 1963, and required massive grain imports. Grain exports from each of the three major food-exporting countries—the United States, Canada, and Australia—reached record or near-record levels.

Food Shortages. The less-developed regions of Asia, Africa, and Latin America have been plagued with food shortages in recent years. A generation ago these regions were net food exporters, shipping some 11 million tons of grain annually to the developed regions, principally western Europe. During the early 1940's, however, they lost their exportable surplus and began to import food. As population growth rates accelerated in the late 1950's and early 1960's, their need for food imports climbed sharply, reaching a record 25 million tons in 1965. Although food output per person in these regions generally rose during the 1950's, by 1965 it showed a tendency to decline. Trends in both production and trade indicate that the less-developed countries are rapidly losing the capacity to feed themselves.

There are two ways to increase food production —by expanding the area under cultivation or by raising the output per acre in a rapid, sustained fashion. The latter is a rather recent development, confined largely to the more advanced countries. Some regions, particularly North America and western Europe, depend solely on a rising output per acre for increases in production. Many less-developed countries, however, have not yet developed a significant yield-raising capability. Furthermore, they have nearly exhausted the area of new land that can be brought readily under cultivation.

Falling further behind in the race between food production and population are such major countries as Communist China, India, the United Arab Republic, and Pakistan, plus several smaller nations in Asia and Africa. These countries contain half of the world's people, and nearly all of them import large quantities of food. They are characterized by low levels of literacy, low incomes, subsistence agriculture, and poorly developed or nonexistent agricultural supplier industries. Producer incentives are frequently lacking, and the new ideas and new cultural practices needed to raise agricultural productivity move with painful slowness. When incomes

Index
number

TRENDS IN PER CAPITA FOOD PRODUCTION 1952-53 to 1956-57 = 100

are low and agriculture is subsistence oriented, as in these countries, little cash is available for purchasing fertilizer, pesticides, and improved varieties of grains and other food crops.

In the Soviet Union and many eastern European countries, food shortages are due largely to the weak link between effort and reward. Unless this basic defect is remedied, the need for imported food in these countries probably will continue to increase.

Food Surpluses. A generation ago, six out of seven of the world's major geographic regions—North America, South America, eastern Europe (including the Soviet Union), Asia, Africa, and Oceania—were net grain exporters. Western Europe alone was an importing region. Today, only two regions—North America and Oceania—are consistent net exporters. Because Oceania has only 1% of the world's cropland, it is a relatively small exporter. North America, however, by rapidly increasing its grain exports, is becoming the breadbasket of the world.

The United States is the only country that limits the amount of food its farmers can produce. All other countries produce as much grain as they can, either for home use or export. However, in 1954

the United States, in an effort to link its excess food-producing capacity with the needs of the food-importing countries, adopted what is now commonly known as the Food for Peace program. Under this program the United States ships large quantities of food to needy countries on concessional or noncommercial terms. These massive shipments consist largely of wheat, but they also include rice, corn, nonfat dry milk, and soybean oil. U.S. food exports under the Food for Peace program, totaling \$1.7 billion in 1965, exceed the total food exports of any other country.

Three factors could limit the amount of food that can be transferred from the United States to the less-developed countries which need food but cannot afford to buy it: (1) the ability of American farmers to produce; (2) the availability of resources to finance these transfers; and (3) accommodations for transport and distribution. However, it is only the latter two factors that tend to limit American food shipments to such countries. Port facilities in India, for example, were strained to the limit in 1965. The cost of concessional food shipments, averaging more than \$1.5 billion annually, accounts for more than one fourth of the U.S. Department of Agriculture's annual budget. American farmers produced about 175 million metric tons of grain in 1965 and could have produced perhaps 40 million more tons if a market had existed.

Population Explosion. World population, estimated at 3.3 billion in mid-1965, is gaining by more than 2% per year. Some 65 million people—roughly equivalent to the population of France and the Scandinavian countries—were added in 1965. During the next 15 years, the world must prepare to feed an additional 1 billion people. Most of this projected increase in population will come in the less-developed regions; and this growth will further worsen the already serious imbalance between food and people.

The explosive rates of population growth that characterize nearly all less-developed countries are sometimes ascribed incorrectly to rising birth rates. In fact, however, they are due largely to a reduction in death rates, particularly among infants. The age-old equilibrium between high birth rates and high

PERSONS SUPPLIED PER U.S. FARM WORKER

HOW FOOD PRODUCTION COMPARES WITH POPULATION

(By regions, 1960)

Source: United Nations Food and Agricultural Organization

death rates has been destroyed. A new equilibrium can be established either by falling birth rates or rising death rates.

The less-developed countries are experiencing rates of population growth far higher than those ever experienced by the advanced countries. As a group, the advanced countries have never had a population growth rate much above 1% annually. Populations in the less-developed countries, however, are expanding at a rate of from 2 to 3% annually.

Much of the hard-earned increase in food production in the less-developed countries in recent years has been largely or entirely offset by increases in population. A comparison of western Europe and Latin America makes clear the relation between population growth and an adequate food supply. Both regions have expanded agricultural production at a rate of about 2.5% annually over the last decade. In western Europe, where population has been growing at about 1% per year, diets have improved

substantially; but in Latin America, where population has increased by nearly 3% per year, food consumption per person has declined.

A major development in 1965 that may contribute toward slowing down the population explosion was the large-scale distribution in several countries of the new intra-uterine contraceptive device, commonly called IUD. It is the first birth-control device that is both economically and technically practical for large-scale use in the low-income countries, making possible the organization of nationwide family-planning programs. IUD became available in quantity in both the United States and India in the early part of the year, and in August the first Indian factory manufacturing IUD's went into production.

President Johnson added to the likelihood that 1965 will mark a turning point in the worldwide effort to bring population growth rates down to manageable levels. In his State of the Union address he said, "I will seek new ways to use our knowledge to help deal with the explosion in world population

UPI

HUNGRY CHILDREN of South Vietnam are fed spoonfuls of peaches by a U.S. Marine during a lull in combat.

and the growing scarcity in world resources." (See **POPULATION TRENDS**.)

Dietary Levels. *The World Food Budget*, a detailed study published by the U.S. Department of Agriculture late in 1964, showed that two thirds of the world's people live in countries where average diets are nutritionally inadequate. Throughout the world the quality of diet is closely related to the level of income. All countries with diets below the minimal nutritional standards lie in the less-developed regions of Asia, Africa, and Latin America, while all European and North American countries have adequate diets.

The per capita intake of calories in the diet-

deficit countries averaged scarcely two thirds that of the United States. Differences in animal protein intake were even greater, with the consumption per person in the diet-deficit countries only one tenth that of the U.S. rate. The average American consumes nearly one egg and one quart of milk (in all forms) every day, but the average person in the diet-deficit countries gets only one egg and one quart of milk every ten days. The lack of adequate amounts of high-quality protein in diets is the chief cause of severe malnutrition.

The percentage of the world's population suffering from nutritionally inadequate diets has diminished gradually throughout this century. However, the number of people affected is greater now than ever before, and continues to increase. Most of the people added to the world's population in 1965 were born in countries where average diets were nutritionally inadequate. (See **NUTRITION**.)

Expanding the Food Supply. A few of the less-developed countries have registered great success in improving their agriculture. Nationalist China (Taiwan), Greece, and Mexico are included in this group. The latter two, food importers until recently, have become net food exporters.

Although many less-developed countries expanded food output in 1965, the increases usually fell short of meeting the rising food needs. The expanding food shortages in the developing countries stem from their inability to realize the existing potential as rapidly as is required. Only a few countries have been able to develop the policies and provide the agricultural inputs needed to increase food production in a rapid, sustained fashion.

Existing agricultural technology has been developed largely in the advanced temperate-zone countries of North America and western Europe. The need for agricultural progress, however, is greatest in the tropical and subtropical regions, where most of the food-deficit, less-developed countries lie. A much greater effort is needed to adapt borrowed technology to local conditions.

Plant-breeding efforts that have been under way for several years are beginning to succeed in several areas. Outstanding varieties of short-stemmed, dwarf wheat, developed by the Rockefeller Foundation in Mexico, contributed heavily to Mexico's emergence as a wheat exporter. These varieties have been introduced into both India and Pakistan—

UPI

A FOOD-DEFICIENT COUNTRY, Tanzania encountered additional troubles in 1965 when drought ruined crops. Tanzanians shown here gathered to pray for rain.

countries with wheat-growing conditions similar to those of Mexico. In the Philippines the International Rice Research Institute, which is supported by a number of private philanthropies and governments, reported encouraging results in developing improved varieties of rice for use in tropical and subtropical rice-producing countries.

The United Nations, the World Bank, and countries that give or receive aid began to pay more attention to agriculture in 1965 than in years past. For example, India established a Food Grain Corporation patterned closely after the Commodity Credit Corporation of the United States. The corporation's principal function is to support prices of farm products, thus encouraging farmers to use more fertilizer.

The Outlook. The potential for increasing food production in the food-deficit regions over the next few years is good. Nevertheless, the prospects are dim for realizing this potential as rapidly as population growth requires. Thus, it is likely that imbalances between the amount of food and the number of people will worsen, and that the more advanced countries, particularly the United States, will provide ever-larger quantities of food for the less-developed countries.

Half of all the people in the world live in the rural areas of Asia, Africa, and Latin America. Lifting their food production to satisfactory levels is an immense undertaking and demands far-reaching behavioral changes on the part of millions of farmers. The food supply problem can be attacked in three major ways: (1) by shipping more food to the food-deficit countries; (2) by helping these countries improve their own agriculture; and (3) by assisting them in developing family-planning programs. In 1965, at least some progress was made on all three fronts.

LESTER R. BROWN

Staff Economist, U.S. Department of Agriculture

U.S. FOOD INDUSTRY

The U.S. food industry, which includes some 37,000 factories with 1.6 million workers and ships more than \$68 billion worth of food annually, continued in 1965 to introduce new and improved manufactured foods, as evidenced by the items available in the country's supermarkets. Meanwhile, U.S. farmers set another crop record during the year, lifting output 17% above the 1957-59 level. (For details of farm output, see AGRICULTURE.)

New Products. Freeze-dried fruit in breakfast cereals was the outstanding food products success story of 1965. Heretofore, the market for freeze-dried foods was limited largely to the military forces, campers, and in the case of freeze-dried shrimp, institutions. In the freeze-drying process, food is quick-frozen and then dried in a high vacuum, permitting the frozen moisture to be removed without going into a liquid state. Freeze-dried food products are light in weight, porous, and easily rehydrated. They require no refrigeration, but they must be stored in airtight and moistureproof packages.

The distribution of so-called synthetic meats—formerly sold only in health-food stores—has expanded to major supermarkets. Synthetic meats are soy-protein fibers spun by means of a special process into food having a meat-like texture and flavored to

AFRICA imports much food, but this market at Abidjan, Ivory Coast, sells vegetables and fruits from nearby farms.

U.S. FOOD EXPORTS helped India avert famine in 1965. Wheat being loaded in Bombay will be delivered to villages.

simulate chicken, pork, or beef. These products, fabricated with complete control over fat content (type and amount), protein value, and other nutritional characteristics, were marketed in frozen, canned, and dehydrated forms in 1965. Spun soy-protein fibers also can be used to produce nearly any kind of food with a natural fiber structure, including products that resemble fish, fruits, certain vegetables, nut meats, potato chips, and coconut.

Low-calorie peanuts, obtained by a new process announced by the U.S. Department of Agriculture, are expected to become available commercially in the near future. The oil is squeezed out mechanically by a process that does not distort the shape of the peanut, except for a slight enlargement. In the process, the moisture in the peanuts is increased to a relatively high 6% before pressing; after pressing, the peanuts are soaked in water to restore their original shape. The appearance and flavor of the roasted nuts are practically indistinguishable from the conventional product. The new process reduces the oil content (and therefore the calories) of peanuts by about 80%.

Food Irradiation. The preservation of foods by irradiation moved closer to commercialization in the United States as several major food processors undertook pilot-plant studies. In Canada the application of pasteurizing doses of irradiation to potatoes to inhibit sprouting began on a commercial scale with the new crop.

In the United States the Food and Drug Administration (FDA) approved use of irradiation for sprout inhibition in potatoes, for insect deinfestation of wheat, and for the sterilization of bacon. Another pending use of irradiation is for treating dehydrated vegetables to increase the rate of rehydration.

Packaging. Easy-to-open containers, including cans, bottles, and rigid-foil types, were used originally for packaging beer. Now they are used as containers for soft drinks, cheese spreads, nuts, coffee, frozen citrus concentrates, sardines, and soup mixes. Even heat-retorted foods are being processed successfully in scored-lid cans by means of a modified retorting-cooling cycle that subjects the scored lids to less pressure stresses.

A so-called truth-in-packaging bill, sponsored by Sen. Philip Hart (D, Mich.), would authorize a government agency to establish standard weights for food packages so that shoppers could easily compare prices with units of weight. The present practice in the industry is to use standard package sizes to

facilitate mass production; hence, weight per package varies from one product to another. The industry contends that the proposed legislation would sacrifice mass-production savings and require higher prices.

Electronic Heating. Conventional heating in an oven or deep fat fryer poses the problem of controlling time-temperature relationship to end up with the proper moisture content and the desired degree of brownness. These two objectives can now be achieved separately by using conventional heating to obtain the desired degree of brownness, followed by electronic heating to obtain the proper moisture content. (In electronic heating, water molecules of the food preferentially absorb the energy input and become heated so that heating occurs literally from the inside out.) For potato chips a dielectric oven of 30 to 300 megacycles is used; for crackers, a microwave oven of 300 to 3,000 megacycles.

Foodborne-Disease Controls. More stringent microbiological controls by government agencies are in the offing to control the spread of foodborne diseases, such as botulism and salmonella. Milk, of course, is already under such control. In 1965 the U.S. Department of Agriculture issued regulations requiring that egg products from federally inspected plants or those moving in interstate commerce either must be pasteurized or undergo bacteriological tests for certification as free of salmonella.

A lack of information about the significance of various forms of bacteria commonly present in foods, and the number of bacteria that can be tolerated from a public health standpoint, temporarily impede the establishment of more microbiological standards for foods.

Food Council of America. In 1965 the Food Council of America was formed by executives of the leading food-industry associations to act as an industry spokesman against attacks by some food faddists, professional consumer councils, and legislators. Its "Food Is A Bargain" advertising campaign pointed out in 1965 that food takes less than 19% of the average consumer's take-home pay.

FOREIGN AID, U.S.

As in recent years, the United States in 1965 used foreign aid as a major instrument to help achieve in less-developed countries its objectives of economic and social development, internal political growth, international cooperation, and the forestalling of Communist military threats. Economic aid was provided by several separate but related U.S. agencies—the Agency for International Development (AID), the Food for Peace Program, the Peace Corps, and the Export-Import Bank of Washington—and by contributions to the United Nations and international financial agencies. U.S. military aid was administered by the Department of Defense.

Net aid expenditures (except for the Peace Corps) from July 1, 1945, to Dec. 31, 1964, totaled \$97,283,000,000, including \$33,841,000,000 in military grants. The balance consisted of \$41,986,000,000 in economic grants; \$16,790,000,000 in net economic credits; \$3,376,000,000 in other economic aid; and \$1,290,000,000 in investments in international financial agencies.

Aid Policies in 1965. The U.S. government gave special attention to the serious but controversial issue of rising populations in the less-developed countries because the increased needs of these growing populations can almost cancel out development efforts. President Johnson, for the first time, officially announced that U.S. aid would deal with the world population explosion. In February, AID

made a \$400,000 grant to establish a Latin American center to study population growth. There were also reports that the president would soon propose an expanded Food for Peace Program to help feed rising populations until local food output increased. The successful economic aid program for Nationalist China, formerly a major aid recipient, ended on June 30, but military aid continued.

The aid program of the Alliance for Progress in Latin America showed progress, with member nations meeting or exceeding their pledged development contributions. (For the second year, Latin America achieved the goal of a 2.5% per capita gross economic growth rate, and most countries began economic planning and tax and land reforms.) Alliance programs touched the daily lives of nearly half of Latin America's 200 million people.

In Latin America, as in all less-developed countries, two major problems were sharply defined. First, fluctuating and usually falling prices for exported raw materials often resulted in losses equal to the aid received. Second, the repayment of debts became increasingly burdensome (70% of economic aid is now in loans). An AID report in July showed that debt service totals \$5 billion a year, and offsets 30% of all aid received.

Foreign aid was involved in the year's major international crises. In a speech in April concerning the war in Vietnam, President Johnson called for a Southeast Asian regional development program, including the formation of an Asian development bank. He committed the United States to give the overall program \$1 billion over an unspecified period of time, to help achieve cooperation and peace in

the area. The president said that North Vietnam would be eligible to receive some of this aid.

A meeting at Manila in December formally established the Asian Development Bank. It was capitalized at \$1 billion, of which the United States pledged \$200 million. Membership is open to all countries in the United Nations or its agencies, which means that Communist China, North Korea, and North Vietnam are ineligible.

Aid to the Dominican Republic was suspended in May as a result of the civil war which erupted in that country. Aid was resumed on September 5 with the announcement that the United States might provide \$100 million by the end of 1966 to help the new provisional government rehabilitate the war-torn country.

In September, military aid shipments to India and Pakistan were cut off, and economic aid was slowed down, because of the reported use by both countries of U.S. military aid in their three-week war over Kashmir.

Export-Import Bank. A wholly owned U.S. government corporation, the Export-Import Bank of Washington engages in three major types of operations to finance increased U.S. exports: loans to foreign borrowers, credit insurance for U.S. exporters, and guarantees to U.S. commercial banks. Authorizations in fiscal year 1965 totaled \$1.86 billion. Of this amount, \$435 million was used for long-term dollar-repayable loans, mostly bearing 5.5% interest, with repayment periods of from 8 to 15 years. About two thirds of these went to meet

the capital needs of less-developed countries, principally in Latin America, which can accept "harder" terms than those prevailing for AID loans.

Foreign Aid Program for Fiscal Year 1966. In adopting the aid program for 1966, Congress made fewer changes in the president's proposals than in any other recent year. In his annual foreign aid message to Congress (Jan. 14, 1965), President Johnson did not ask for any basic changes in aid policy, although there was a slight intensification of existing policies. He requested appropriations of \$3,380 million—\$1,170 million for military aid and \$2,210 million for economic aid—slightly less than that requested for 1965, and the smallest sum since the Marshall Plan began in 1948. (See Table 3 for details.)

In a special aid message on June 3, 1965, the president requested an extra \$89 million for economic aid to Southeast Asia. Congress approved this request and incorporated it in the general aid bill. However, it did not grant the unlimited authorization for aid to Vietnam that had been requested.

Aid in 1966 was to be concentrated in a few countries where it would do the most good. Eleven nations exposed to aggression by Communist countries, in an arc extending from Greece to Korea, were to receive 72% of the military aid. South Vietnam, Laos, Korea, and Jordan would receive 88% of military-support types of economic aid. Countries making maximum self-help efforts—India, Brazil, Turkey, Chile, Nigeria, and Tunisia—were to be given 74% of the development loans. The program also continued the recent trend of providing mostly economic rather than military aid. Two thirds of U.S. aid in 1966 was for economic development. (In 1956, two thirds went for military purposes.)

* Unobligated balance as of June 30, 1965, continued available for funding programs in fiscal year 1966.

More aid was to go through international financial agencies, and other developed countries were to be asked to increase their aid efforts. Also, in line with an increased emphasis on enlisting private enterprise in development activities, guarantees for new U.S. private investments in less-developed countries were increased from \$2.5 billion to \$5 billion. In a separate bill the president asked for authorization to give U.S. businesses an investment tax credit in proportion to their investments in less-developed countries. (AID's Advisory Committee on Private Enterprise in Foreign Aid, headed by Arthur Watson of the International Business Machines Corporation, recommended the tax-credit plan in its July 1965 report.) Congress did not act on this plan, however.

In another bill the president asked approval of a U.S. three-year authorization of \$750 million for the Inter-American Development Bank. Congress approved and appropriated the first installment of \$250 million. It also appropriated \$104 million to the International Development Association.

The funds appropriated for foreign aid in the Foreign Aid and Related Agencies Appropriations Act totaled \$3,218 million, or \$32 million more than the total for 1965 and only 6.9% less than the total requested. The main amendments initiated by Congress in the aid bills were the imposition of flexible restrictions on aid to the United Arab Republic, to countries that traded with North Vietnam, and to countries that permitted, or failed to take adequate steps to prevent, the destruction of U.S. property by mob violence.

The Senate tried to pass a two-year aid authorization, instead of the usual one-year bill, with the aim of recasting the whole program in two years after a full reevaluation. This attempt failed, however, because of opposition by the House.

FOREIGN INVESTMENTS

The record rise of private capital outflow to nearly \$6.5 billion was a major feature of the U.S. balance of payments in 1964. All components of capital outflows, except purchases of foreign securities, moved upward in the year. Direct investments were up \$0.4 billion to \$2.4 billion; net lending by banks rose by about \$1 billion to \$2.5 billion, and loans and acquisitions of short-term assets abroad by non-financial firms increased to \$0.9 billion. Purchases of foreign securities were inhibited by the Interest Equalization Tax (IET) and were reduced to a net of \$0.7 billion. Long-term government credits and claims rose by more than \$1.6 billion, but short-term government claims dropped by \$100 million.

These capital outflows, together with reinvested direct investment earnings of \$1.4 billion, gains in market prices of foreign securities, and sizable additions to foreign assets resulting from improved reporting by some banks and business firms, raised the

accumulated total U.S. foreign investments to nearly \$99 billion, and the total of private investments to over \$75 billion by the end of 1964.

The data on capital flows for the first half of 1965 show that after the announcement of the government's program to improve the balance of payments, banks acted quickly to cut back their foreign lending, and business firms repatriated a large part of their liquid funds held outside the United States. However, industrial companies had planned a considerable increase in spending for foreign investments in 1965 and 1966. Consequently, direct-investment capital outflows in the first six months of 1965 were \$2.1 billion, or double the amount for the first six months of 1964. However, because of the special nature of some of these outflows in early 1965, and because of attempts to substitute foreign financing for U.S. funds, the capital outflows in the second half of 1965 were expected to be considerably lower than those for the first half of the year.

Late in 1965, the U.S. government announced new guidelines for companies with sizable direct foreign investments. The voluntary program for 1966 would include the provision that direct investments for 1965 and 1966 be limited to 90% of the amount during the period from 1962 through 1964. This formula would permit a direct investment rate for 1965 and 1966 of about 35% above the annual average of the 1962-64 period. It would result in about \$2.4 billion of new direct investments in 1966, a \$1 billion cut below the 1965 outflows.

Direct Foreign Investments. U.S. company investments in Europe accounted for nearly half of the additions to direct investments in 1964 (capital flows and retained earnings), and about the same proportion in early 1965. In 1964, the figure included over \$300 million to acquire existing foreign interests. Of the \$1.7 billion added to the value of direct investments in Europe in 1964, \$0.9 billion went to the Common Market countries, \$0.4 billion went to the United Kingdom, and \$0.4 billion to other European countries. Preliminary data for the first half of 1965 show capital outflows to Europe well ahead of those in the first half of 1964. Investments in manufacturing rose by \$900 million in 1964; nearly two thirds went to the Common Mar-

ket countries, and most of the remainder was invested in the United Kingdom.

Canada. Direct investments in Canada rose by \$750 million in 1964. Net capital outflows totaled only \$250 million, and additional investment was financed out of retained earnings.

Other Countries. U.S. companies also raised the rate of their new investments in other developed countries, principally Australia and Japan, but held to the relatively low level of recent years for investments in the Republic of South Africa. In Australia, where manufacturing investments have been growing quite vigorously, recent projections of expenditures for new plants indicate some acceleration of U.S. investments.

Direct investments in the less-developed countries—Latin America, Africa (excluding the Republic of South Africa), and Asia (excluding Japan)—rose by \$0.8 billion. Nearly 70% of new investments were in the Western Hemisphere, but they were limited largely to a few of the Latin American countries. Investments, especially for manufacturing, rose notably in Mexico.

Earnings and Income. In 1964, earnings of foreign affiliates of U.S. firms rose by a record \$530 million to \$5.1 billion. Manufacturing operations accounted for \$0.3 billion of the increase and brought total industry earnings to \$1.8 billion. Earnings of mining operations registered substantial gains, mainly in Canada and Latin America, but foreign earnings of the petroleum industry advanced little in 1964.

Income return from these foreign affiliates in the form of dividends, interest, and branch profits, rose even more rapidly than earnings. These receipts amounted to \$3.7 billion in 1964, a gain of \$0.6 billion over 1963. Income from petroleum operations rose to \$1.9 billion, manufacturing affiliates paid out \$0.9 billion, and mining operations returned \$0.4 billion. Other industry groups accounted for the remaining \$540 million.

Other Foreign Investments. Purchases of new foreign issues in the United States amounted to \$1.1 billion in 1964 and \$632 million in the first half of 1965. Canada continues to raise a considerable amount of capital through this channel, but issues of European and other countries have become inconsequential because of the interest equalization tax. U.S. investment firms have been active in placing new foreign securities in European markets, and a number of such issues in the U.S. market have been sold entirely to foreign investors. On balance, U.S. investors have been liquidating their holdings of foreign securities.

Foreign Investments in the United States. Capital inflows from foreign investors totaled \$110 million in 1964. In the first half of 1965 there was a negligible net inflow. Foreign investors liquidated holdings of U.S. securities, mainly for British account, but they increased funds held in long-term time deposits in the United States. Much of this increase was the temporary investment of the proceeds of the sale of U.S. securities. There also has been a small net outflow of direct investment capital in recent years (\$5 million in 1964). Despite these liquidations, the value of foreign holdings of corporate U.S. stocks increased because of improvement in market prices. (See also BANKING; INTERNATIONAL FINANCE.)

YOICHI OKAMOTO

U.S. POLICY IN VIETNAM is discussed by President Johnson (right) and his principal advisers: (l. to r.) Secretaries Robert McNamara and Dean Rusk, and McGeorge Bundy.

FOREIGN POLICY, U.S.

U.S. foreign policy in 1965 was marked by the most extensive controversy since the Korean War. The country seemed to be divided between advocates of a policy placing the containment of communism above all other considerations, and those who favored an internationalist policy to relax tensions. The former group believed that the United States should assume "great power responsibility" to intervene politically or militarily in support of American concepts of democracy and anticommunism wherever they seemed to be threatened. The latter critics advocated that the United States should pursue policies of international cooperation leading toward a world of peacefully coexisting states.

While maintaining an internationalist position in principle, the United States government in 1965 resorted to force in order to halt revolutionary movements believed to be Communist inspired in some unstable countries. By pursuing policies believed to be required by its "great power responsibility," the United States faced the danger of escalating civil strife in Vietnam into a world war. It also found itself opposing the right of self-determination by intervening in the Dominican Republic.

The year began with an optimistic American public believing that President Lyndon B. Johnson, who had been overwhelmingly elected in November 1964 on a foreign policy program of peace and international cooperation, would help to make the year one of significant progress toward a stable and peaceful world. But the world was far from tranquil. Hostilities existed in Malaysia, Yemen, South Arabia, Sudan, the Congo (Léopoldville), and South Vietnam.

Since 1954 the United States helped South Vietnam defend itself against the indigenous Vietcong (Communist) guerrillas, who were aided by North Vietnam. However, it came as a surprise to the American people when the Johnson administration, in February 1965, ordered the bombing of North Vietnamese bridges and installations. The United States sent Marines and other forces to engage

TEACH-IN DEBATE on U.S. policy in Vietnam took place in Washington, May 5. Historian Arthur M. Schlesinger, Jr. (standing) speaks in favor of U.S. policy. Opposed were (l. to r., at table) British writer Isaac Deutscher and Hans Morgenthau of University of Chicago.

UPI

directly in the hostilities against the Vietcong. In April the United States intervened in a civil war in the Dominican Republic by sending a large contingent of Marines to prevent a possible Communist takeover. These actions stirred up controversy and resulted in a great public debate on United States foreign policy.

Involvement in Vietnam. The United States had increased its involvement in South Vietnam by gradually raising the number of its military advisers there from 685 in 1961 to about 23,000 by the beginning of 1965. The escalation of the hostilities in 1965 was rapid. After Vietcong forces attacked the American base at Pleiku in South Vietnam in February 1965, the United States retaliated by bombing North Korean staging areas, bridges, and installations north of the 17th parallel. By its action the United States hoped to stop the infiltration of men and arms from North Vietnam to the Vietcong guerrillas in South Vietnam. Contingents of American Marines and ground forces were sent in increasing numbers, and totaled some 75,000 men by July. After suspending its air raids for about a week in May in the hope of encouraging "unconditional negotiations," the United States renewed them by utilizing long-range jets based in Guam and Okinawa. The attacks approached Hanoi, capital of North Vietnam.

The official American government position was set forth in a white paper issued by the Department of State in February 1965. According to this docu-

ment, North Vietnam was guilty of aggression against South Vietnam because it had infiltrated guerrillas and arms to aid the Vietcong; South Vietnam was engaged in "self-defense against armed attack"; and the United States was assisting South Vietnam at the latter's request through "collective self-defense," as permitted by Article 51 of the United Nations Charter. All that was necessary to stop the war, as Secretary of State Dean Rusk has said, was for North Vietnam to stop its assistance to the Vietcong and to "let its neighbors alone."

President Johnson, in an important address at Johns Hopkins University on April 7, expressed the determination of the United States to defend the independence of South Vietnam. He told his audience that this independence had been pledged by the Eisenhower and Kennedy administrations, as well as by his own. He said that the United States was prepared to negotiate unconditionally to end hostilities with North Vietnam, but would not negotiate directly with the Vietcong because the guerrillas were only an arm of the North Vietnamese government. Furthermore, he said that the United States would contribute \$1 billion to rehabilitate and develop Southeast Asia after peace was restored. The president further emphasized negotiations in his address to the United Nations Conference at San Francisco on June 25.

After consulting with his principal advisers for a week in late July, President Johnson ordered an immediate increase in United States fighting

strength in Vietnam from 75,000 to 125,000 men. The American obligation to South Vietnam, Chinese aggressiveness, the necessity of containing communism in Asia, and the national security seemed to President Johnson to require and to justify the escalation of the war in Vietnam in order to maintain the honor, credibility, and security of the United States. He emphasized "American willingness to begin unconditional discussions with any government, at any place, at any time." The president said that he was ready to discuss proposals that North Vietnam had made for ending the war, and he indicated that the Vietcong might be represented in negotiations by one of the participating governments. (See also ASIA; JOHNSON, LYNDON BAINES; VIETNAM.)

The Public Debate on Vietnam. American opinion became increasingly concerned and divided as escalation of the war in Vietnam proceeded in 1965 and the prospect of a full-scale war on the Asian mainland emerged. There were four alternative policy proposals: (1) withdrawal; (2) escalation; (3) negotiation; and (4) support of the president's policy.

Very few persons favored simple withdrawal, but many critics, including Democratic Senators Wayne Morse of Oregon and Ernest Gruening of Alaska, newspaper columnist Walter Lippmann, and Professor Hans J. Morgenthau of the University of Chicago, expressed the view that no substantial American interest was involved in Vietnam. They believed that a full-scale land war in Asia would be catastrophic, and that United States intervention was legally and morally unjustifiable and politically inexpedient. They recommended that compromises should be made with a view to disengaging the United States from Vietnam as rapidly as might be possible with a minimum loss of face.

At the opposite extreme, Republican presidential candidate Barry Goldwater, Republican House

leaders Gerald Ford and Melvin Laird, Democratic Senator Gale McGee of Wyoming, New York *Times* columnist Hanson Baldwin, and others seemed to favor escalation of the war in order to contain communism behind the 17th parallel in Vietnam. Advocates of this point of view considered the containment of communism the primary goal of United States foreign policy.

Between the two extremes were critics like Democratic Senator J. William Fulbright of Arkansas, chairman of the Foreign Relations Committee. In a notable speech to the Senate on June 15, Fulbright said that a complete military victory in Vietnam could not be gained without prohibitive costs, but that the unconditional withdrawal of American forces would have disastrous consequences. He recommended that the United States try to "end the war at the earliest possible time by a negotiated settlement involving major concessions by both sides" based on the Geneva accords of 1954. Senator Fulbright's view was shared by some other congressional leaders.

Academic discussion groups or "teach-ins" were organized by several university groups during the spring of 1965 to debate the pros and cons of American policies in Vietnam. The discussions indicated the great anxiety over the situation that existed among academic people generally. A national teach-in, held in Washington, D.C., on May 15-16, attracted an audience of 5,000 persons, and was participated in by government officials and leading educators.

One of the administration's chief spokesmen at some teach-ins was McGeorge Bundy, a principal foreign policy adviser to President Johnson. He defended the president's policy on grounds that the United States had committed its honor to defend South Vietnam, and that the national interest required the continuing containment of communism, especially Chinese communism with its expansive ambitions and increasing military capabilities. (Later, Bundy announced that he would leave the post to become president of the Ford Foundation on Feb. 28, 1966.)

Opposition critics at the teach-ins often emphasized the lack of a vital interest of the United States in Southeast Asia. Many took issue with the "domino theory" that if one independent state in Southeast Asia fell, then all would fall like a row of dominoes. This theory suggested an indefinite expansion of communism if South Vietnam went Communist. These critics pointed out that as Ho Chi Minh was a nationalist as well as a Communist, he probably would seek to prevent Chinese control of Vietnam, just as his countrymen had resisted Chinese domination for centuries.

Many international lawyers argued that the United States had no commitment to defend South Vietnam, and that intervention was illegal unless the United Nations found that the situation threatened a general war. They believed that the United States could promote stability in Asia by adhering to United Nations principles of self-determination of peoples and non-intervention in the domestic affairs of other countries, and by giving economic aid to Asian nations.

Many critics emphasized the moral aspects of the situation in Vietnam. They criticized the barbarities of guerrilla warfare and the increasing atrocities against civilians by both sides; the mounting American casualties (totaling over 3,700 by October 1965 and including over 1,000 dead), in addition to thousands of Vietnamese dead; and the danger of

escalating the conflict into World War III. Most of the critics said that military victory was impossible without an all-out war, and that with it, victory would be meaningless.

The Dominican Republic. United States military intervention in the Dominican Republic in 1965 caused less anxiety than the situation in Vietnam because there was less danger of an indefinite escalation into a world war. Criticism of the Johnson administration's policy on legal, moral, and political grounds was similar to the criticism of United States policies in Vietnam.

The United States had favored the democratic government of Dominican President Juan Bosch, who had been overthrown by a military junta in 1963. After a revolution aimed at restoring him to office broke out in Santo Domingo in April 1965, President Johnson was informed that some Communists were active in the revolution and were supported by Premier Fidel Castro of Cuba. On April 28 the president, after brief consultation, sent a contingent of Marines to the Dominican Republic to protect Americans. Later he sent a larger force to try to end the civil strife. The United States professed the military objectives of establishing a zone separating the factions and of ending the hostilities. But by its intervention the United States appeared to favor the Dominican military junta over the rebels.

The Consultative Committee of the Organization of American States (OAS) supported the United States intervention and proposed to change it to an OAS operation. Contingents were sent to the Dominican Republic by a few Latin American countries, but control of the military force remained with the United States. The hostilities had caused extensive destruction of life and property and an economic collapse in Santo Domingo. But by midsummer a cease-fire took effect. In September a provisional government was established through the efforts of an OAS mediating commission.

Many Latin Americans and some foreign policy critics in the United States believed that the unilateral intervention by the United States violated both the UN Charter and the OAS Charter, as well as other inter-American treaties forbidding unilateral intervention of any kind and for any purpose. However, some OAS resolutions had provided for consultation and possible OAS action to prevent Communist infiltration into the Western Hemisphere.

The Johnson administration appears to have been motivated by the fear that communism might expand in the Caribbean area. The United States therefore acted in accordance with the principles of the Monroe Doctrine to prevent foreign domination of the Dominican Republic. (See DOMINICAN REPUBLIC; LATIN AMERICA.)

The NATO Alliance. The problem of the cold war in Europe and the viability of the North Atlantic Treaty Organization (NATO) continued to concern United States policymakers in 1965. Despite the dilemma in which American intervention in Vietnam had placed the Soviet Union, the latter seemed willing to continue the present *détente* with the United States. The Soviet Union continued to oppose the American proposal for a multilateral nuclear force under NATO, as did France and some other NATO members. The United States did not press the proposal during the year.

The French view that NATO is obsolete has gained some adherents in the United States. These proponents argue that NATO is unnecessary because the danger of a Soviet attack on the West has receded;

MICHAEL GREGORY-PIX

DEMONSTRATORS in San Francisco in mid-October protest against U.S. military involvement in Vietnam conflict.

that the European states will continue to demand independent nuclear capabilities; and that NATO diverts attention from the United Nations and weakens it. In spite of this widespread skepticism and President de Gaulle's threat to take France out of NATO in 1969, the United States continued to favor policies for strengthening the NATO alliance. (See also EUROPE; NORTH ATLANTIC TREATY ORGANIZATION.)

United Nations. An important development in United States foreign policy was the sudden death in London on July 14 of Adlai E. Stevenson, the able United States representative to the United Nations. He was succeeded by Arthur Goldberg, who resigned from the Supreme Court to accept the post. In his first official speech before United Nations delegates, Ambassador Goldberg declared that the United States would no longer insist that the Soviet Union and some other nations must be penalized for failing to pay their share of the costs of past UN peace-keeping forces. He said the United States would not try to frustrate the general consensus of the members that the work of the UN General Assembly should proceed normally. (See also GOLDBERG, ARTHUR; STEVENSON, ADLAI EWING.)

President Johnson renewed expressions of United States allegiance to the United Nations at the conference which met in San Francisco on June 25-26 to celebrate the organization's 20th anniversary. The United States fully supported the Security Council's arrangements for a cease-fire in Kashmir between Indian and Pakistani forces in September. The United States had halted its military aid to both countries after the fighting in Kashmir began. (See also UNITED NATIONS.)

FORESTRY AND LUMBERING

A comprehensive appraisal of timber resources in the United States highlighted the year 1965 in forestry developments. The year was marked also by the inauguration of a study of laws and practices relating to federal land in the public domain and by an expansion of research efforts in forestry.

Timber Resources. A nationwide study of timber resources, conducted by the Forest Service of the U.S. Department of Agriculture, showed that forests in the United States occupy 759,000,000 acres, or one third of the total land area in the 50 states. Of this forest land, 509,000,000 acres were classified as commercial, including 208,945,000 acres of sawtimber stands; 264,367,000 acres of young growth pole, seedling, and sapling stands; and 35,533,000 acres of nonstocked land. The study revealed that though total annual growth exceeds the total annual timber cut, the supply of large trees and better quality timber is declining.

Public Lands. In 1965 the Public Land Law Review Commission, under the chairmanship of Representative Wayne N. Aspinall of Colorado, began a three-year study of the laws and practices governing the administration of the 710,000,000 acres of federal forests and related wild lands in the public domain. The commission's recommendations should lead to a general overhauling and updating of laws and policies for management of these lands. In addition to Chairman Aspinall, the commission consisted of five senators, six representatives, and six citizens appointed by the president.

Forest Service Operations. For the operation of the Forest Service in the fiscal year beginning July 1, 1965, Congress appropriated \$296,372,000 in regular funds, an increase of nearly \$18.8 million over the previous fiscal year. The total included \$162,-318,000 for national forest protection and management, \$78,672,000 for national forest roads, \$36,-689,000 for forest research, and \$17,513,000 for federal cooperation with states and private forest owners.

Appropriations were earmarked for construction of a new forestry services laboratory at Missoula, Mont.; a forest engineering laboratory at Houghton, Mich.; a naval stores and timber laboratory at Olustee, Fla.; a silviculture laboratory at Sewanee, Tenn.; a tree seed laboratory at State College, Miss.; and a headquarters for the Rocky Mountain Forest and Range Experiment Station at Fort Collins, Colo.

The total area of national forests, national grasslands, and other lands administered by the Forest Service was 186,203,183 acres on July 1, 1964. From that date until June 30, 1965, timber harvested from the national forests under sustained-yield management plans totaled a record 11,240 million board feet.

In 1965 the Forest Service invited bids for the purchase of 8,750 million board feet of timber on the North Tongass National Forest in Alaska. This proposed sale, one of the largest national forest timber sales ever proposed, called for a 50-year cutting period and required the installation of a new pulp mill.

In 1964 the Forest Service reported that over 134 million persons took advantage of the recreational opportunities of the national forests.

Forest Fires. In the national forests, a total of 5,406 fires burned 49,491 acres in January-July 1965, compared with an annual average of 6,568 fires that burned 118,264 acres in the corresponding periods

of the preceding five years. In May a fire swept 16,000 acres in Nebraska National Forest, destroying timber and grass that had been planted to protect lands in the sandhills. In August a fire blackened more than 11,000 acres of timberland in Washington County, Maine. This was Maine's worst woodland fire since the Bar Harbor holocaust of 1947.

For the United States as a whole, 116,358 fires burned 4,197,309 acres in the fiscal year 1964. In Canada, the Department of Forestry reported that 7,-670 fires burned 470,001 acres in the fiscal year 1963.

Lumber. Lumber production in the United States in the fiscal year 1964 totaled 35,408 million board feet. This figure was higher than the postwar low of 32,000 million board feet in 1961, but lower than the postwar high of 38,200 million in 1956. Softwood lumber output, which accounted for more than 80% of total U.S. lumber production in 1964, increased 6.1% over 1963; hardwood production decreased 12.4%.

United States imports of lumber in 1964, according to the Department of Commerce, amounted to 5,222 million board feet, as against the record 5,335 million in 1963. Imports in 1964 included 4,913 million board feet of softwood lumber and 305 million of hardwood. United States exports in 1964 totaled 956 million board feet, up 9.3% from the 1963 total. This total included 797 million board feet of softwood lumber, 135 million of hardwood lumber, and smaller amounts of railroad ties and box shoeks.

According to the Bureau of Labor Statistics, the wholesale price index of lumber increased from an average of 98.9 for 1963 to 100.7 for 1964 (1957-59 = 100). The postwar peak of 104.6 was reached in 1956. There were 321,500 full- and part-time workers in U.S. sawmills, planing mills, and logging camps in March 1965, as against 313,200 workers in March 1964.

In Canada, total lumber production in 1963 was 9,621 million board feet. According to the Department of Forestry, about 95% of this total output was softwood lumber. Two thirds of Canada's total production was exported.

The estimated world production of sawed wood in 1963 was a record 350 million cubic meters (1 cubic meter equals 424 board feet), according to the UN Food and Agriculture Organization. About four fifths of this total was softwood lumber. The Soviet Union led in production, followed by the United States, Japan, and Canada.

PICTORIAL PARADE

PRESIDENT DE GAULLE meets the press on September 18 at the Élysée Palace, but postpones announcing his candidacy for reelection for two months.

FRANCE

Although 1965 was a presidential election year, the French seemed content to let President Charles de Gaulle speak for the nation until shortly before the December 5 balloting. Late in November, however, political opposition—heretofore fractured and incoherent—crystallized, and a strong contender appeared in the person of François Mitterrand, the candidate of the “united left.” Suddenly the Gaullist domestic and foreign policies became campaign issues, as opponents attacked the president’s conception of “elective monarchy.” For the first time in several years, it became apparent that de Gaulle’s nationalistic stand on NATO (the North Atlantic Treaty Organization) and EEC (the European Economic Community, or Common Market) did not have the backing of 50 million Frenchmen.

In the end, the French chose stability and continuity by electing President de Gaulle to a second seven-year term, but he did not get the “massive endorsement” he had expected and requested. His 44.6% plurality of the vote on December 5 had fallen short of a majority, necessitating a runoff election two weeks later in which he won 55.2%. Political pressures were expected to grow as France prepared for parliamentary elections in 1967, and it was thought that the Gaullist government would review its policies to meet the challenge.

DOMESTIC AFFAIRS

The resurgence of political activity came late in the year. Earlier, 1965 had been generally calm at home and abroad. The Gaullist regime did not noticeably increase its international prestige, although it continued to insist upon the inviolability

of national sovereignty and to block any advance toward supranational institutions in Europe. The proud and prosperous Fifth Republic slumbered contentedly under the paternal rule of its elderly president. “Perfection is not of this world,” de Gaulle remarked on September 9, “but in relation to what existed yesterday, the French state appears at present to be entirely transformed in terms of solidity and capacity. No one in the world mistakes this.” Until shortly before the election, most Frenchmen seemed to agree.

The Campaign. The 1965 presidential election was the first popular election for the presidency in modern French history. For reasons of health or of political strategy, President de Gaulle held off announcing his own candidacy until November 4, and then he did so in a television address in which he threatened that if he were not massively supported in office, the republic would return to chaos “even more disastrous than it experienced in the past.” At 75 years of age, de Gaulle was not expected to serve the full seven-year term. After announcing his candidacy, however, he indicated to top officials that he intended to serve out the full term. The president made no mention of a successor, although he had often promised that he would designate one.

At this time few people doubted that de Gaulle would sweep to victory. What opposition existed was divided among multiple parties and multiple candidates, of whom the most important, from right to left, were: the extreme right-wing lawyer and deputy, Jean-Louis Tixier-Vignancour; the conservative Senator Pierre Marcilhacy; the middle-of-the-road Senator Jean Lecanuet; and the Socialist Senator François Mitterrand. All they apparently

hoped for was to register a substantial minority vote of protest.

It soon appeared, however, that de Gaulle, in treating a presidential election as though it were a referendum, had committed the unforgivable error of underestimating and spurning the enemy. Passive discontent was stirred up by the rival candidates, whom de Gaulle collectively termed "champions of decadence," when they appeared on television. By late November, Senator Mitterrand, who had garnered support from all the left-of-center parties, was making headway, and de Gaulle's lead was further cut by the previously little-known Senator Lecanuet, who emerged as an attractive television personality in the campaign.

The Election. In the election of December 5, Mitterrand captured 31.7% of the votes. As the second place contender, he qualified to face de Gaulle in the runoff election scheduled for December 19. Lecanuet, who came in third with 15.6% of the votes, was eliminated along with the other candidates, but it was thought that more would be heard from him in the future. Mitterrand's campaign gained impetus, and on December 19 the senator acquired an impressive 44.8% of the vote, to de Gaulle's 55.2%.

For the first time in seven years the country had been offered a real political choice and had seen a serious political debate on the television screen. Although de Gaulle was the victor, the French knew that their future might well be with Mitterrand (age 49) or even Lecanuet (45), rather than with this extraordinary old man.

Politics and Local Elections. Early in the year attention was focused on the municipal elections held on March 14 and 21. In certain towns and cities, notably in the Paris region, Socialists and Communists formed temporary electoral alliances against the Gaullist UNR (Union for the New Republic)

coalition, but such was their mutual suspicion that no overall accord emerged. Almost nowhere did the Gaullists dislodge opponents of the regime. In Paris they obtained the largest number of seats of any party, but not a majority. On the whole, the grass-roots elections in 37,779 municipalities gave moderate gains to the Communists, slight comfort to the Gaullists, and a measure of defeat to the quarrelling Socialists. Thus, the profound schism remained between local and national politics.

Gaston Defferre, Socialist mayor of Marseille, emerged triumphant from the March elections. Although he had scorned Communist help, he won easily over his Gaullist opponent. Defferre was then de Gaulle's principal challenger for the presidency, and his supporters set about to create a united front among left and center non-Communist opponents of the president. However, a rift had already formed within the Socialist party between those who backed Defferre's anti-Communist stand and those who favored a "popular front" alliance with the Communists.

On May 28 the Christian Democratic MRP (Popular Republican Movement) party congress overruled the objections of its elder statesman, former Premier Pierre Pflimlin, and provisionally agreed to support Defferre in December by means of a Democratic-Socialist federation. MRP conditions were that there must be no deal with the Communists and that the federation must not be an adjunct of the Socialist party, but must try to form a permanent party capable of obtaining a parliamentary majority.

The ball was then thrown to the Socialists. Former Premier Guy Mollet led the fight against federation with the MRP, accusing Defferre of seeking "adventures and chimeras." Defferre replied bluntly: "Since the liberation we have lost half our voters and three quarters of our active members. Let us not allow this chance to pass." On June 6

Foreign Trade (1964): Exports, \$8,995,000,000 (chief exports, 1963: automobiles, \$495,000,000; clothing, \$196,000,000; iron and steel plates and sheets, uncoated, \$177,000,000; wheat and meslin, unmilled, \$158,000,000; wine, \$152,000,000); imports, \$10,070,000,000 (chief imports, 1963: crude petroleum, \$821,000,000; coal, \$304,000,000; wool, greasy, \$205,000,000). Chief trading partners (1963): West Germany (took 17% of exports, supplied 18% of imports); Belgium-Luxembourg (took 9% of exports, supplied 8% of imports); U.S. (took 5% of exports, supplied 10% of imports).

Transportation: Roads (1964), 888,559 miles (310,685 paved); motor vehicles (1964), 9,735,000 (automobiles, 7,800,000); railways (1963), 23,954 miles; merchant vessels (1964), 572 (4,804,000 gross registered tons); national airline, Air France; principal airport, Paris.

Communications: Telephones (1964), 5,336,374; television stations (1964), 44; television sets (1964), 5,000,000; radios (1963), 14,551,000; newspapers (1961), 136 (daily circulation, 11,800,000).

the Socialists approved negotiations with the MRP, but imposed conditions of their own, one of which was that the federation charter should propose a government take-over of private (mostly church) schools and express the hope of eventually "reintegrating" the Communist party into political life. The two sets of conditions prevented MRP and Socialist agreement, and the federation proposal collapsed on June 18. A week later Defferre withdrew his candidacy.

The Gaullists were delighted; the Communists hardly less pleased, since they could now resume their wooing of the Socialists. Once more the parties were authors of their own misfortunes, and the president was given an issue with which to deride them before the public.

The September triennial elections for 91 of the Senate's seats held few surprises. The MRP and the Democratic Left made slight gains; the UNR and the Independents and the Socialists suffered slight losses. Gaston Monnerville, leader of the Radical Socialists, not only was returned to the Senate but was reelected as its president. An outspoken opponent of "elective monarchy" and of de Gaulle's 1962 violation of the constitution, Monnerville remained a symbol of the divorce between local politics and the plebiscitary regime ruling France.

De Gaulle and the Opposition. President de Gaulle made provincial tours in the spring and early summer, drawing strength from the grass roots. Scorning umbrellas, he stood in the pouring rain of one of Europe's worst summers, speaking familiar words about the greatness, prosperity, and stability of France, and its need to be independent of the United States and the Soviet Union: "Allez la France!" he shouted at Chartres on June 19, "Allez la France! Allez!" This was what he called (September 9) "direct contact" with the nation, so that it "can know the man who is at its head, discern the ties which unite it to him, be acquainted with his ideas, his acts, his plans, his concerns, his hopes." The popularly elected president, he said, would henceforth be "the keystone that covers and solders the edifice of our institutions."

Opposition manifested itself in many ways. An old enemy, Gen. Maxime Weygand, died on January 28 at the age of 98. As Marshal Foch's chief of staff, he had read the 1918 armistice terms to the Germans. Later he had commanded the French army in the catastrophe of 1940 and then served as a member of Marshal Pétain's government immediately thereafter. Weygand had lived on as a symbol of the old army's hostility to the "leader of the Free French." De Gaulle's refusal to permit the funeral service to be held at the Invalides was a logical but bitter reprisal against a former superior who had ended by supporting the Secret Army Organization (OAS) against the president. The ceremony itself, presided over by Cardinal Feltrin, archbishop of Paris, was an impressive demonstration, and a reminder of the schisms on which the Fourth and Fifth Republics had been erected.

De Gaulle's act was in startling contrast with his mass measures of amnesty for those who had plotted against him during the Algerian war. By mid-summer all but 353 of the 3,226 persons sent to prison had been released. Yet, as late as May, extremists tried to assassinate the president during his tour in the Vendée. The abortive murder plot was directed from abroad by the OAS, which has sworn to kill de Gaulle for his "treason" in granting independence to Algeria.

MUNICIPAL ELECTIONS were held on March 4. President de Gaulle votes at the Colombey-les-Deux Eglises town hall.

Economy. The French economy slowed again in early 1965, with the growth rate at approximately 2.5%. The government's stabilization plan had not removed the threat of inflation, but it seemed to bring about what Premier Georges Pompidou called "a stagnation of production." This was especially true in the automobile, textile, shoe, and machine tool industries. Unemployment, though low, was rising, and many workers were not employed full time. Industrial unions complained about labor's failure to share in the general prosperity, and farmers were worried by the stalemate on Common Market agricultural prices. On September 1 the government raised the minimum industrial wage 2%, to the equivalent of 41 cents an hour, and the minimum wage 2.37%, to the equivalent of 33 cents an hour.

In answer to complaints from big business, the government assured liberalized credits to encourage investment and exports. It promised to raise some \$200 million by means of a 15-year-bond issue and to invest that amount in selected industries. Incentives to encourage savings and channel them into industry, said the president, would be "one of the state's vital tasks for the next few years." The economy picked up toward the end of the year, but the 5% target growth rate of the Fifth Economic and Stabilization Plan (1966-70) was unlikely to be realized in the first few years.

In February, President de Gaulle, influenced by the conservative economist Jacques Rueff, called for a return to a modified gold standard. At the same time, France greatly increased its normal purchases of gold, exchanging more than \$500 million for gold in the early months of 1965 in what seemed part of an effort to reduce the role of the British pound and the U.S. dollar in international trade. As an "olive branch," however, France offered the United States early payment of \$178,500,000 of its postwar debt. (See INTERNATIONAL FINANCE.)

Defense. The Gaullist defense policy remained an expression of the president's determination to keep France "free of vassalage." De Gaulle said in a television address on April 27 that "the supreme interest of mankind dictates that each nation be responsible for itself, free from encroachments, aided in its progress without conditions of allegiance.... Thus we are reaching the point at which no state in the world could bring us death without receiving it on its own land, which is without doubt the best possible guarantee."

Early in July the government announced the production of a new, smaller nuclear bomb, which could be readily carried in the Mirage IV bomber. On November 26, France launched its first earth satellite from a test center at Hammaguir in Algeria's Sahara, becoming the third nation to do so independently. Construction of a nuclear testing site on the Tuamotu Islands (near Tahiti) continued in preparation for the transfer of French activity from the Sahara in mid-1967. Research continued on ballistic missiles and on plans for a satellite launching site in French Guiana. France offered to make the Guiana space range available to other nations, and in December the United States government expressed interest in jointly developing the center for international use. (See ATOMIC ENERGY; MISSILES; SPACE EXPLORATION.)

A striking break with the 60-year old tradition of universal military service came on April 7, when the government approved a bill exempting at least half the eligible annual contingent. Manpower needs had greatly shrunk with the disappearance of many overseas posts and the conversion of the army to a modern weapons system. Opponents of the bill argued the civic virtues of universal service and proposed reduction of the period of service from 18 to 12 months, but the government said that 12 months was too short a period for proper training. The National Assembly finally modified the period to 16 months and passed the bill on May 27.

FOREIGN AFFAIRS

While asserting French independence, the Gaullist regime appeared determined to cut its military, political, and—to some extent—economic ties with the United States, western European nations, and the international alliances to which France is a party.

De Gaulle's obstruction of NATO and his lack of cooperation in the Common Market brought charges that he was anti-American and anti-European. In general, French links with traditional allies were strained, while de Gaulle made overtures to traditional enemies in the Communist bloc.

NATO. The independence of French defense policy was such that NATO's Secretary General Manlio Brosio said on January 4: "France, under de Gaulle, can no longer be considered a full working member, but rather an associate member of the alliance." The year bore out the judgment. Repeatedly, French spokesmen declared that the "unwieldy and costly" alliance must be completely reformed before 1969. On May 30 it was announced that France would not participate in the biennial Fallex-1966 exercises, but would simply observe them. The gap between the French strategy of instant nuclear retaliation and the American plan of graduated retaliation to various forms of possible Soviet attack made discussion futile at the NATO defense ministers conference in Paris in June. France also boycotted NATO's routine joint military exercises in the fall. The French actions constituted the strongest assault to date on the concept of integrated European defense.

"The vital fact of these last seven years," de Gaulle told the nation on April 27, "is that we have resisted the sirens of surrender and have chosen independence.... In short, France now has a policy, and it is being made in Paris." At his September 9 press conference, he served notice that "in 1969, by the latest, the subordination known as 'integration' which is provided for by NATO and which hands our fate over to foreign authority shall cease, as far as we are concerned." In an effort to reduce the "excessive role" of the United States in European defense, the government on October 16 suggested two alternative alliances to NATO: one a loose treaty of alliance of the present members, and the other a European alliance (without the United States) with some integration of non-nuclear facilities. France strongly objected to U.S. plans for a multilateral nuclear force under NATO. (See also the article on NORTH ATLANTIC TREATY ORGANIZATION.)

Common Market. France's attitude toward European unity was negative to the extent of refusing to participate in Common Market negotiations on mat-

WIDE WORLD

ters that might lead to political as well as economic integration in western Europe. In talks with German Chancellor Erhard at Rambouillet on January 19 and 20, de Gaulle agreed to study the question of political cooperation, but the French attitude later proved to be uncooperative. Italy's proposal that the foreign ministers of the six Common Market members meet in Venice in May or June was rejected by France on the ground that there was insufficient agreement about the nature of European unity to avoid conference failure. Disagreement centered on de Gaulle's refusal to contemplate any measure of supranationalism, his opposition to British participation, and his insistence that the other five members turn away from dependence on United States protection and accept French leadership in building an independent European nuclear force. On March 31 he stated that talks on European cooperation could proceed only after agreement on a common agricultural policy.

Through the spring and early summer the struggle continued in Brussels. Wisely or not, the other five members tried to tie an EEC agricultural accord to the creation of an independent Common Market budget and a strengthened European Parliament. This "plot," as the French called it, led by the Dutch and Italians and supported by the Germans, resulted in a crisis beginning in June. "We do not want a supranational Europe," de Gaulle said to the parliamentarians at the annual Élysée garden party on June 10. "For us, that would be to want to disappear." He and Premier Pompidou noted that the parties calling for European integration were those most determined to maintain the Atlantic alliance, and that this alone demonstrated the falseness of their pose as champions of Europe.

French wrath descended on the EEC Executive Commission and the "Eurocrat" civil servants. On July 1 a government spokesman declared that the Brussels discussions were "at a standstill" and indicated that France henceforth would boycott EEC meetings. Within the next few days, France threatened to raise tariffs against the other five members, announced new subsidies to her farmers, invited her permanent representative at EEC headquarters to return home, and promised to boycott European Coal and Steel Community meetings and a meeting of the EEC finance ministers. Walter Hallstein, president of the Executive Commission, said on July 8 that if France carried out her threats, she would commit "the greatest destructive act in the history of Europe and even the free world since the days of Hitler."

Supported by his former opponent, Belgium's Foreign Minister Paul-Henri Spaak, de Gaulle insisted that the farm accord underhandedly had been tied to the movement for common institutions. On September 9 he said that the crisis had been "inevitable" and that the whole series of European agreements concluded before 1958 had been dominated by the interests of the five other EEC members, made possible by French abdication, and presided over by "a technocracy for the most part foreign."

The stalemate continued. The five other EEC members, while continuing the discussion on agricultural financing measures, appealed for an end to the French boycott. On October 26 they accepted Spaak's proposal and invited France to attend a Council of Ministers meeting away from Brussels, from which Hallstein's Executive Commission would be excluded. On December 22, France expressed willingness to

meet with the five members in Luxembourg in late January 1966 to discuss the basic rift.

Relations with Western Europe. France's relations with West Germany in 1965 varied from lukewarm to chilly. In cordial talks at Rambouillet in January, Erhard and de Gaulle agreed to discuss German unity with Britain and the United States, but not Germany's participation in some type of Atlantic nuclear force. Much of the cordiality resulted from the president's promise to consider the subject of European unity, and therefore faded with the failure of the EEC negotiations in Brussels. Germans applauded de Gaulle's view that "the German problem is, indeed, the European problem," but not his comment, on February 4, that Germany's problem of satisfying her eastern neighbors' territorial claims "cannot be resolved except by Europe herself"—which implied exclusion of the United States. Although the French government denied that such was the intent, de Gaulle's unilateral pursuit of closer relations with the Soviet Union and his refusal to identify himself with the West's approach to Moscow on the German problem deepened the suspicion that France hoped to exclude the United States from dealing with the Soviet Union on this matter.

The president's visit to Bonn on June 11 and 12 brought no lessening of strain, despite various promises of accord and cooperation in the economic, military, and technical fields. On September 9 he alluded to the January 1963 treaty of cooperation as being still "in a stage of cordial potentiality in many domains." His public reference on February 4 to "the reasonable and skillful policy adopted by Chancellor Adenauer's government," contrasted with his failure to mention Erhard at all. Relations were not enhanced by the published report of an interview de Gaulle gave to a foreign diplomat in the fall in which he was quoted as saying that "Germany must never again exert an influence on European decisions nor have a voice in Europe's military strategy," and that "it was a pity the postwar four-power control of Germany had ever been abandoned." The French foreign ministry

vigorously denied the report, and de Gaulle repeatedly stated that Germany should play a great part in the new Europe.

Relations with Italy, too, were distant. When the Dutch and the Italians sprang their "plot" at the Brussels EEC negotiations, de Gaulle remarked: "Do they think we can be bought like Yemen or Italy?" A happier moment occurred in July when the 7¼-mile automobile tunnel beneath Mont Blanc, linking France and Italy, was opened in a joint ceremony by de Gaulle and Italy's President Saragat.

A visit to Paris on April 2 and 3 by Prime Minister Harold Wilson indicated that Franco-British relations were slightly warmer than before. Earlier, de Gaulle had gone to London "to pay homage to the great Churchill," who died on January 24. On that occasion he remarked on "how satisfied I was with the contact" with Wilson. In turn, Wilson called his talks with de Gaulle in April "frank, robust and constructive." He assured de Gaulle that Britain would defend the pound. Differences were manifest on policy in Southeast Asia, where de Gaulle opposed both the United States role in Vietnam and the British commitment to defend Malaysia against an Indonesian attack. Agreement was reached on high-level talks toward joint production of military aircraft. On November 24, de Gaulle hinted that he might abandon his opposition to British membership in the Common Market. (See also *EUROPE*.)

Overtures to Eastern Europe. France strengthened its links with eastern European countries in 1965. In mid-January, France welcomed President Edward Ochab of Poland and concluded cultural and economic agreements with Rumania. At the same time, Hungary indicated interest in France's policy of "an independent Europe, a European Europe, and an enlarged Europe."

Greeting Valerian A. Zorin, the new Soviet ambassador, on April 10, de Gaulle said: "Over and above all, and even above ideologies, there are two necessities in the world today, namely, peace and progress. I am sure that Russia and France today agree fundamentally on these two objectives and agree also, so far as they can, on attaining them together." A statement issued on April 29, following a cordial visit to Paris by Russia's Foreign Minister Gromyko, said that both countries deplored the worsening situation in Vietnam, desired an end

to intervention there, and urged a return to the Geneva agreements of 1954 and 1962 that had guaranteed the independence of Vietnam, Cambodia, and Laos.

In late October, Foreign Minister Couve de Murville traveled to Moscow for talks with the Soviet leaders. Various technical agreements concerning television and atomic energy were concluded with Moscow. But the major purpose of these renewed ties with eastern Europe was to return France to the traditional independent foreign policy of the Third Republic.

Franco-American Relations. Despite routine invocations of historic friendship, the Franco-American chill showed few signs of warming. The U.S. government was displeased by the French run on American gold early in the year. In July the French rejected the American proposal for an international monetary conference as being likely to accentuate existing differences or result in merely sham reforms. An American picture-taking reconnaissance flight over the Pierrelatte nuclear plant in the Rhône valley in late July aroused French ire. The French foreign minister protested, but the incident was closed after the U.S. State Department expressed "regret."

The American and French presidents sniped at each other in public statements. De Gaulle let it be known on May 22 that he disapproved of U.S. intervention in the Dominican Republic rebellion and wanted the troops withdrawn. U.S. Secretary of State Dean Rusk thereupon attacked him for his alleged irresponsibility. Apparently French foreign policy held that resistance to the United States would increase the stature of France.

Africa and Asia. Relations with North Africa, President de Gaulle remarked on February 4, were "evolving favorably, very favorably." The 1962 Sahara oil agreement was renegotiated with the new Algerian government of Houari Boumedienne. The new accord, signed on July 29, gave Algeria an estimated royalty of 75% of the profits. France also promised Algeria some \$400 million in aid over the next five years. French relations with the United Arab Republic also were considerably more friendly.

In Asian affairs, de Gaulle stood ready as before to help bring about a settlement of the war in Vietnam, and he proposed an international conference

to that end. Full of praise for neutral Cambodia, he was hostile to American escalation of the Vietnamese fighting. Trade agreements with Communist North Vietnam were extended for one year on March 16. The South Vietnamese government broke off diplomatic relations with France on June 24.

Diplomatic contacts with Peking remained cordial. Trade with China rose considerably in 1964, but was still a small portion of French overseas commerce in 1965. André Malraux, the French minister of state, had talks in Peking in July with Mao Tse-tung and other Chinese leaders, but beyond confirming de Gaulle's position that the Far Eastern question could be solved only by direct great-power negotiations, including China, the results of the visit were not evident. De Gaulle took no side in the Indian-Pakistani war that broke out in the summer of 1965, merely saying that the conflict was "deplorable."

As in the case of NATO, de Gaulle undertook to dissociate France from SEATO (Southeast Asia Treaty Organization). France withdrew its units from SEATO'S spring naval maneuvers in the China Sea, virtually boycotted SEATO'S Ministerial Council meeting in April, and withdrew its delegation to the SEATO military staff in May.

French Community. The only disturbance within the tranquil French Community in 1965 occurred in St. Pierre and Miquelon, an island territory off the southern coast of Newfoundland, where labor troubles brought unrest between the population and the governor. Paris dispatched a detachment of special police to support the governor against the municipal council, which was then dissolved on June 2.

United Nations. The French role at the United Nations was shadowy at best. De Gaulle charged that "the so-called 'United' Nations" had deviated from its charter and had "arrogated" to itself the right to make "armed interventions" in Korea and the Congo (Léopoldville). However, he also referred to Secretary-General U Thant's "wisdom" and proposed that Washington, Moscow, London, Peking, and Paris renegotiate the UN Charter at a Geneva conference. In July he withdrew the French representative from the UN Korean command. France again argued for admission of Peking to United Nations membership. The government continued to boycott the UN Disarmament Committee and refused to pay its assessment for past peace-keeping costs.

FRENCH LITERATURE

France lost two first-rate writers in 1965. Roger Vailland (b. 1907) was best known for his novels *Drôle de jeu* and *La loi*. Jacques Audiberti (b. 1899) was the author of the excellent play *Le mal court*, and of several volumes of poetry and fiction. (See NECROLOGY.)

In general, nonfiction dominated the 1964-65 French literary season, prevailing over fiction both in number of works published and in popularity.

Nonfiction. The best sellers were for the most part biographies, books on current events and problems,

FRENCH EMBASSY PRESS AND INFORMATION DIVISION

RAYMOND QUENEAU published one of the most important French novels of 1965, the irreverent *Les fleurs bleues*.

satirical writings, and ironic essays.

Among the literary biographies were André Maurois' monumental *Prométhée, ou La vie de Balzac*, Henri Troyat's *Tolstoï*, and Françoise Mallet-Joris' *Marie Mancini*. Simone de Beauvoir, in *Une mort bien douce*, describes the death—and the life—of her mother; and Maurice Goudekot, in *La douceur de vivre*, writes about his wife, the novelist Colette. Françoise Gilot's *Vivre avec Picasso* was an international best seller.

Current events were represented by numerous books on Charles de Gaulle, of which François Mauriac's *De Gaulle* was the most widely read. Other works of the same title were penned by Raymond Aron and Jean Lacouture, and Jacques Laurent produced the highly irreverent *Mauriac sous de Gaulle*. The Vietnam war was the source of a series of literary works, the principal one being Lucien Bodard's *L'humiliation*.

Can the word "satire" be used in connection with Roger Peyrefitte's latest offspring, *Les Juifs*? Some readers refused to see in it any satirical intent and consider it as a kind of academic practical joke. Others, such as Jean Cau, denounced it—perhaps unjustly—as an anti-Semitic diatribe. In any case, the book had record sales. The same was true of *En France: la fin de l'opposition*, by Jean François Revel. This caustic commentary indirectly attacks the Fifth Republic but mostly criticizes the apolitical attitude and lack of idealism of most Frenchmen.

Fiction. Few important new authors were intro-

LOUIS ARAGON won critical acclaim during the year for his complex autobiographical novel called *La mise à mort*.

FRENCH EMBASSY PRESS AND INFORMATION DIVISION

duced to the reading public by the 1965 literary awards. Georges Conchon won the Prix Goncourt for *L'état sauvage*, an amusing satire of racist attitudes in the new African countries. Although the novel was not enthusiastically received by the critics, it had immediate commercial success. Other literary prize winners (Jean Blanzat, Monique Wittig, and Jean-Pierre Faye) were successful only by the prestige they obtained.

The two most important novels of the year were by Raymond Queneau and Louis Aragon. Queneau's *Les fleurs bleues* is a great parade of caricatures, both learned and clownish. The novel is as irreverent and whimsical as his earlier success, *Zazie dans le Métro* (1959). The new work abounds in plays on words and amusing verbal inventions, but also offers the reader a reflection on today's world and a disillusioned, stoical philosophy that is similar to Montaigne's. Aragon's *La mise à mort* is a rich, complex book. Its verbal virtuosity is prodigious, and it proclaims the dazzling poetic gifts of the author. The book is a novel, an autobiography, a mirror, and a song of love and death.

Other works of fiction suffer by comparison with *Les fleurs bleues* and *La mise à mort*. Violette Leduc's *La batarde* is a powerful though thoroughly unpleasant feminine confession; Marcel Arland's *Le grand pardon* sums up the experience of a man and a writer; in *Le Palais d'Hiver*, Roger Grenier portrays a 20th century Emma Bovary in a Béarnais setting; and *Les sultans*, by Christine de Rivoyre, is a witty description of today's "independent" woman and her true subservience to men.

Jean-Marie Le Clezio, an author who had shown much promise in 1963 with his *Procès verbal*, reaffirmed his lyrical qualities in 1965 in a collection of short stories entitled *Fièvre*. Paul Morand published two collections of stories under the titles *Tais-toi* and *Nouvelles du coeur*. Because of their imaginative and artistic values, they are reminiscent of tales by both Prosper Mérimée and André Pierre de Mandiargues.

Poetry. It is difficult to choose among the numerous works of poetry published each year those that have a chance for survival. The poems in Georges Emmanuel Clancier's *Terres de mémoire* are intimate, personal elegies. His poetry sings of happiness, of the flight of time. Another poet who draws upon memories of his past is Claude Sernet. He suggests intimate secrets and deep wounds in *L'étape suivante*. In a very different vein, Olive Tamari's *Le grand voyage de la mer* expresses the pleasure of form and matter in a wave of surrealistic imagery.

Noteworthy also is the posthumous edition of *Derrière son double* and *La fin et la manière* by Jean-Pierre Duprey, a young poet who committed suicide in 1959. His work is in the tradition of Jarry, Lautréamont, and Artaud. He was a visionary: what he has left is short, intense, fragmentary, and much admired by many young poets.

FRIENDS, Religious Society of

The Five-Years Meeting of Friends (Quakers), the largest body of Friends in the United States, changed its name to Friends United Meeting in January 1966. This body, first organized in 1902, has a membership of more than 70,000 Quakers. It encompasses 14 yearly meetings (separate Quaker

districts), ten in the United States and four in other countries. The headquarters for Friends United Meeting are in Richmond, Ind.

Friends of both Philadelphia Yearly Meeting and New York Yearly Meeting, assisted by Quakers from other parts of the nation, cooperated in a project to rebuild Negro churches which had been burned in Mississippi. During 1965 this active group of Friends built a community center near Canton, Miss., for Negroes in that area.

The American Friends Service Committee (AFSC) sent a small mission to South Vietnam to try to find ways that Quakers might aid the Vietnamese. The AFSC also carried on an exchange of teachers between the United States and the Soviet Union as part of the school affiliation program; initiated family planning projects in Hong Kong, Baroda (India), and elsewhere; started a new housing project in Mexico; and worked actively for school desegregation in the United States.

Conferences held during 1965 included the fifth Race Relations Conference at Earlham College, Richmond, Ind., at which meeting John Youngblut of Atlanta, Ga., was named the new chairman. In addition, the United Society of Friends Women and the Quaker Men met simultaneously at Whittier, Calif.; the Association of Evangelical Friends held its seventh triennial session at Haviland, Kans.; and the Young Friends of North America convened at Syracuse, Ind.

FRUITS

American orchards and vineyards produced more abundantly in 1965 than in 1964. Production of the 20 major fruits totaled 19,644,000 tons, compared with 18,862,000 tons in 1964. Record crops of grapes and cranberries were responsible for the increase, offsetting significant declines in pears and cherries. The production of apples, grapes, sour cherries, plums, prunes, and nectarines was substantially above average.

Noncitrus fruit production in 1965 was 3% greater than in 1964, and 14% above the 1959-63 annual average, according to the Statistical Reporting Service of the U.S. Department of Agriculture. Citrus production for the 1965-66 crop year indicated an increase of 7%.

Grapes. The production of grapes in 1965 reached an all-time high of 4,313,060 tons, or 24% more than in 1964, and 33% above the 1959-63 annual average. In 1965, about 4,000,000 tons consisted of European-type grapes grown principally in California and Arizona. California's crop in 1965 included 750,000 tons of wine varieties and 2,560,000 tons of raisin varieties. Production of raisins amounted to 272,000 tons (dried basis), or 39,625 tons more than in 1964.

Cherries. U.S. sour cherry production in 1965 totaled 177,540 tons—the second largest crop on record. The crop was 35% less than the 1964 record, but 31% above the 1959-63 annual average. Sweet cherry production decreased to 85,210 tons, or 29% less than the large crop of 1964, and 2% below the 1959-63 average.

Apples. The 1965 crop of 135,720,000 bushels ran 3% below the 1964 crop, but 11% higher than the 1959-63 average. The crop (in bushels) included: 3,492,000 of summer varieties, 14,293,000 of fall types, and 117,935,000 of winter apples.

Peaches. The production of 74,097,000 bushels of peaches in 1965 was slightly below 1964 production, and 2% below the 1959-63 average.

¹ Estimates of commercial crop in commercial apple areas of each state. (Source: Statistical Reporting Service, U.S. Department of Agriculture.)

Pears. The nation's 1965 pear crop totaled 20,117,000 bushels, or 33% below the 1964 crop and 23% less than the 1959-63 average. Nearly all the production came from California, Washington, and Oregon, which together supplied 17,661,000 bushels.

¹ Season beginning November 1. ² Florida pack only. (Source: fruits—National Association of Frozen Food Packers; citrus juices—Florida Canners Association.)

Plums and Prunes. California and Michigan produced 123,500 tons of plums, or 3% less than the 1964 record production, but 26% above the 1959-63 average. The 1965 prune crop totaled 61,200 tons, down 15% from 1964 and 1% below the 5-year average production.

Apricots. California, Washington, and Utah grew 221,200 tons of apricots—slightly less than in 1964, but 7% above the 1959-63 average.

Dates. California's date output of 19,300 tons slipped 20% below the 1964 crop, and 16% below the 1959-63 average.

Olives. An estimated 52,000-ton olive crop in California was 4% below the 1964 crop but 6% above the 1959-63 average.

Figs. The 1965 fig crop of 53,900 tons (fresh basis) was 20% below 1964 production, and 16% below the 5-year average.

Avocados. Florida grew 2,900 tons of avocados—only one fifth as much as the 1964 crop because of damage by hurricane Betsy in August-September 1965. California's fall and winter crop was forecast at 32,000 tons, or 2½ times the 1964-65 crop.

Cranberries. The 1965 cranberry crop rose 6% above that of 1964—to 1,422,000 barrels—or 11% above the 1959-63 average. Massachusetts, with 745,000 barrels, grew more than half the crop.

Strawberries. The production of 460,977,000 pounds of strawberries was 16% less than the 1964 crop, and 8% below the 1959-63 average.

¹ Approximate weight per box varies as follows: oranges, 90 pounds in Florida and Texas, 75 pounds in California and Arizona; grapefruit, 80 pounds in Florida and Texas, 64 pounds in Arizona and California desert valleys, 67 pounds elsewhere in California; lemons, 76 pounds; tangerines, 90 pounds. ² Season begins with the bloom of the year shown and ends with completion of harvest the following year. ³ Production too small to warrant estimate. (Source: Statistical Reporting Service, U.S. Department of Agriculture.)

Citrus Crop. Citrus production rose an estimated 7% above 1964-65. Larger crops of oranges, grapefruit, lemons, and tangelos were expected. The U.S. Department of Agriculture estimated the crop at 129,100,000 boxes, barring weather damage. Grapefruit production in 1965-66 was estimated at 44,200,000 boxes, based on early prospects.

Foreign Trade. The value of exports of American fruit and fruit products increased from \$274,000,000 in fiscal year 1964 to \$289,000,000 in the fiscal year 1965, according to the Economic Research Service.

The value of fruit and fruit preparation imports increased in fiscal year 1965—to \$283,794,000, compared with \$214,420,000 in the preceding year. Bananas, the largest fruit import, accounted for \$159,133,000 of the 1965 total.

GABON

The major event in Gabon in 1965 was the death of Dr. Albert Schweitzer on September 4 at his jungle hospital near Lambaréné. The passing of the 90-year-old Nobel Prize winner resulted in speculation that his world-famous hospital would be brought under stricter control by the Gabon government or that it would be closed because of a modern public hospital at Lambaréné. On September 15, however, Gabon's ambassador to the United Nations, Bonjean Ondo, announced in New York that Gabon would oppose any "radical transformation" of the jungle hospital, which, he said, would retain "a certain originality" in memory of its founder. (See SCHWEITZER, ALBERT.)

Foreign Policy. The mainstay of Gabon's foreign policy continued to be its loyalty to France. On August 4, President Léon M'Ba declared: "Between Gabon and the France of General de Gaulle there will never be any differences." On August 25 the two countries signed a new accord providing for French aid to Gabon's army. French military protection, if required, would be flown in directly from France.

Gabon was an active supporter of the Organisation Commune Africaine et Malgache (OCAM), a political organization of French-speaking African states established in February. Gabon's relations with the Congo (Brazzaville) were strained during

GABON · Information Highlights

Area: 103,089 square miles.
Population: 462,000 (July 1, 1965, est.).
Chief City (1961 est.): Libreville, the capital, 31,027.
Government: *President—Premier—*Léon M'Ba (took office Dec. 24, 1957). *Parliament—*National Assembly, 47 members; party seating (1965): Gabonese Democratic Bloc, 44; Defense of Democratic Institutions, 3.
Religious Faiths: Roman Catholics, 48% of population; tribal religions, 42%; Protestants, 8%; others, 2%.
Education: *Literacy rate* (1961)—12% of population aged 15 and over. *Total school enrollment* (1961)—67,216 (primary, 63,857; secondary, 2,519; teacher-training, 461; technical, 343; higher, 36).
Finance (1964): *Revenues*, \$29,800,000; *expenditures*, \$29,800,000; *monetary unit*, CFA franc (246.85 francs equal U.S.\$1).
Gross National Product (1962): \$89,300,000.
National Income (1963): \$152,200,000; *average annual income per person*, \$334.
Economic Index (1964): *Cost of living*, 111 (1962=100).
Crops (metric tons): Cassava (1962–63), 114,000; cocoa beans (1964–65), 4,200; coffee (1961–62), 400.
Minerals (1964): Manganese, 948,297 metric tons (ranks 6th among world producers); uranium ore (1963), 1,317 metric tons; gold, 42,760 troy ounces; crude petroleum, 7,668,000 barrels; natural gas, 353,000,000 cubic feet.
Foreign Trade (1964): *Exports*, \$93,600,000 (chief exports: okoumé wood, \$31,400,000; manganese, \$23,300,000; petroleum, \$12,700,000; uranium ore, \$7,900,000); *imports*, \$55,600,000 (chief imports, 1963: motor vehicles, \$7,400,000; clothing, excl. fur, \$2,100,000; machinery for special industries, \$1,600,000). *Chief trading partners* (1963): France (took 50% of exports, supplied 60% of imports); U.S. (took 13% of exports, supplied 12% of imports); West Germany (took 13% of exports, supplied 7% of imports).
Transportation: *Roads* (1964), 3,635 miles (52 paved); *motor vehicles* (1964), 7,100 (automobiles, 2,500); *airlines*, Air Gabon, Transgabon; *principal airport*, Libreville.
Communications: *Telephones* (1964): 2,817; *television sets* (1963), 1,000; *radios* (1963), 30,000.

1965, as both nations traded accusations of border violations.

Economy. Continued exploitation of Gabon's mineral resources by French companies in 1965 resulted in increased outputs of petroleum, uranium, manganese, and gold. For the first time, the value of Gabon's mineral exports equaled that of its forest-product exports.

France promised assistance for the construction of a railroad linking the Mekambo iron ore deposits with the coast, of electric power stations, and of a transistor radio plant. France also promised to help create a new deep-water port at Owendo, and the European Economic Community allocated \$263,000 for a study of the project.

Boston University*

GAMBIA

On Feb. 18, 1965, Gambia (officially The Gambia) received its independence from Britain. It was the oldest and last remaining British dependency in West Africa. Stretching about 300 miles along the Gambia River to a depth of 6 miles on each bank, Gambia is the smallest African nation both in area and population. Except for its short Atlantic coastline, it is entirely surrounded by Senegal, a former French colony. After independence, Gambia retained its membership in the Commonwealth of Nations. The country was admitted to the United Nations on Sept. 21, 1965.

National Problems. Independence came after five years of discussion and detailed planning between the political leaders of Gambia and the governments

GAMBIA · Information Highlights

Area: 4,003 square miles.
Population: 330,000 (July 1, 1965, est.).
Chief Cities (1964 est.): Bathurst, the capital, 28,896.
Government: *Prime Minister*, David K. Jawara; *House of Representatives*—32 popularly elected members plus 4 chiefs; party seating (1965)—People's Progressive Party (19); United Party (13).
Religious Faiths: Muslims, 73% of population; Roman Catholics, 2%; others, 25%.
Education: *Total school enrollment* (1963)—13,447 (primary, 10,517; secondary, 2,708; teacher-training, 150; technical, 72).
Finance (1964 est.): *Revenues*, \$5,964,448; *expenditures*, \$7,491,736; *public debt*, \$1,200,000; *monetary unit*, pound (0.3571 pound equals U.S.\$1).
Crops (metric tons, 1963–64 crop year): peanuts, 93,000 (ranks 18th among world producers); rice, 31,000.
Foreign Trade (1963): *Exports*, \$9,000,000 (chief exports, 1962: peanuts, \$9,298,000; palm kernels, \$249,200); *imports*, \$12,000,000 (chief imports, 1962: cotton fabrics, \$1,366,400; rice, \$1,316,000; motor vehicles, \$664,000). *Chief trading partners* (1962): Britain (took 35% of exports, supplied 40% of imports); Italy (took 56% of exports, supplied 1% of imports); Japan (took less than 1% of exports, supplied 12% of imports).
Transportation: *Roads* (1964), 730 miles (123 paved); *motor vehicles* (1964), 2,380 (automobiles, 1,280).
Communications: *Telephones* (1964): 921; *radios* (1961), 2,500.

DAVID K. JAWARA, prime minister of Gambia, speaks softly and lives modestly, in keeping with his acute awareness of the new nation's economic problems. He is trying to cut down the cost of government and to diversify the country's one-crop economy, which depends on exports of peanuts. "Everything we do," he has said, "is a question of pounds, shillings, pence." Jawara is the leader of the People's Progressive Party, which he helped form in 1959 to give a political voice to his fellow upcountry Gambians, and to advance the slow progress of Gambia toward independence.

Jawara, a Muslim, was born in 1924. He and his Christian wife have five young children. He was trained in Ghana and at the University of Glasgow as a veterinary surgeon, a career that he gave up in 1960 when he successfully ran for Parliament. He then became minister of education and, after the 1962 elections, premier. As prime minister from 1963 onward, he led his nation from self-government under Britain to complete independence.

of Britain and Senegal. The most important question was whether Gambia could survive as an independent state. Its economy depends for capital upon the export of peanuts in an increasingly competitive world market. Thus economic as well as geographic and ethnic factors seemed to dictate some plan for eventual political union with Senegal.

In 1963, Gambia's prime minister, David Jawara, requested a United Nations commission to report on whether Gambia and Senegal could effectively establish closer ties. The UN report stressed the need for immediate cooperation in various forms, leading eventually to the political rapprochement of the two countries. Three things, however, convinced Gambian leaders to try independence: internal political pressure, largely from Jawara's own party; an abortive political coup in Senegal; and disagreement over how soon a closer association should be made with the Senegalese.

Government. The constitution of the new state effected few changes in the structure of government. The crown-appointed governor relinquished his residual powers, and executive authority was vested in the prime minister and the ministry. They hold office at the pleasure of the House of Representatives. However, the House, on June 1, approved a resolution calling for a republic to be proclaimed on the first anniversary of independence (Feb. 18, 1966) and recommended that a plebiscite be held on the question. This proposal, violently opposed by the parties not in power, was defeated by the referendum held in the last week of November, failing by less than 800 votes to gain the necessary two-thirds majority. The original form of responsible government therefore remains unchanged.

Nationalism came late to Gambia. The strongest political party, the People's Progressive Party (PPP), was formed in 1959 and is led by Jawara. The major opposition group, the United Party (UP) led by P. S. N'Jie, was founded in 1951 as a purely municipal party of the capital, Bathurst, and did not play a countrywide role until 1960. N'Jie served as chief minister in 1961, but his party was defeated in the elections of 1962. Jawara has led the government since then, first to self-government and then to independence. There is little difference in the programs of the two major political parties. However, each is definitely a reflection of its leader.

No elections were held prior to independence, and the present composition of the Gambian parliament is based upon the elections of 1962. In December 1964, the PPP and UP agreed upon a form of coalition government. This compromise was never very effective and was abandoned shortly after independence.

In the present government, the governor is only

theoretical chief executive. Actual power is exercised by the prime minister and the members of his cabinet. The 35 Gambian chiefs were an important factor in central government politics before 1960, but since 1962 they have become largely ornamental agents of local government. In 1965 they held only four guaranteed seats in parliament.

Economy. Since 1960, greater competition and larger crops have resulted in a lowering of world prices for peanuts. Because the Gambian economy is based on this crop, little can be done to substantially improve medical, educational, and communications facilities in Gambia. The government has been forced to rely on substantial grants-in-aid from Britain. Finance Minister Sherif Sisay stated that British aid would amount to £745,000 from Jan. 1, 1965, through June 30, 1966, and a further £360,000 for the subsequent 12-month period.

The United Nations is providing aid for a joint Gambian-Senegalese investigation of the long-range development of the Gambia River basin. The survey will not be completed, however, for five years. Meanwhile, pilot studies continue for the further encouragement of rice and citrus culture, as well as tourism. There is no real industry in Gambia and no known mineral potential. In order to free itself from inordinate dependence upon grants-in-aid, the government proceeded with reorganizations of several departments to attempt to balance its operating budget. Any real success for Gambia as an independent state will ultimately depend on agricultural development and economical government.

Associate Professor of History
San José State College

GAMBIA'S INDEPENDENCE DAY, on Feb. 18, 1965, is celebrated by crowds awaiting the arrival of dignitaries.

GARDENING AND HORTICULTURE

Water shortages affecting gardening and horticulture were extremely severe during 1965 in the drought-stricken northeastern United States. Throughout the country new developments in gardening, especially in urban and suburban areas, were adapted to the conservation of water. Home and commercial landscaping included more masonry and other structural elements to reduce maintenance requirements and the use of water.

National Developments. Public interest in city, state, and national landscape beautification received special attention after President Johnson's speech of February 8 on conservation and natural beauty. The United States had one garden for every five people in 1965—the highest ratio in the world. New home owners found that gardens increase the value of their property, beautify its appearance, and add to family prestige.

Indoor landscape gardeners made increasing use of fluorescent lighting to meet the light requirements of various kinds of plants. Indoor decorative plants grow best at room temperatures of 75° F during the day and 65° F at night.

A survey made during the year revealed that 57% of the nation's gardeners are women. A 26% increase in the number of schools assigning gardening plots to school children motivated horticultural interests among young people.

New Products and Findings. Organic chemicals for growth control became very popular for many kinds of plants. Proven growth retardants were Amo 1618, Bonine, Cycocil, and Phosphon, all supplied in varying concentrations by manufacturers. The additive effect of Kinetin on the growth-accelerating

hormone gibberellin induced early opening of unchilled azalea buds. Chrysanthemum flowering was hastened by low night temperatures (60° F) for certain varieties, while higher night temperatures (84° F) delayed flowering. A mixture of a quinolin citrate and an amino succinamic acid, plus 3% sucrose, doubled the size of carnation plants during growth and more than doubled the life of cut flowers (to 16 days).

Young deciduous fruits were thinned out by chemical spray applications of new carbamates. Tea plants sprayed with gibberellin and other growth regulators contained less caffeine and more tannin, thus improving the taste quality of the tea. Three chemical growth retardants applied to rhododendrons increased flower production, especially on the lower branches of plants.

New synthetic flavors recently developed will affect the byproduct use of citrus fruit and mints. Scientists with the Glidden Company of Jacksonville, Fla., discovered how to convert turpentine into lemon and lime flavors. These scientists also synthesized spearmint and peppermint flavors. All four of these new products were approved by the Food and Drug Administration.

A newly developed product, cured lettuce, was considered as a possible substitute for tobacco in cigarettes.

New Plant Varieties. The diversity of plants available to gardeners was evidenced by the recognition of 24,000 species of cultivated plants, representing 4,000 genera. These cultivated species comprise 8% of the known flowering plants of the world. Several varieties, strains, and cultivars within many of the garden species added to the scope of available choices.

ALL-AMERICA FLOWER SELECTIONS

New varieties of old favorites—cosmos, verbena, and snapdragon—were among the 1966 All-America selections.

SUNSET COSMOS, the first red Klondyke cosmos (left), is a gold medal winner. Amethyst verbena (below) is a unique dwarf, compact, blue variety.

ALL-AMERICA SELECTIONS

BRIGHT BUTTERFLIES snapdragon (above) has spikes of open-face flowers in a well-balanced blend of colors.

During 1965, more than 100 new plant patents were issued to horticultural plant developers by the U.S. Patent Office. Most of the new patents were for roses, gladioli, chrysanthemums, and grapes. Plant patent 2500 was assigned to the Conard-Pyle Company for the new rose, Adventure, hybridized by Paul Croix of France. Two new cantaloupe varieties for desert conditions, Campo and Jacumba, were developed cooperatively by federal and state scientists. New vegetable varieties introduced in 1965 were Crimson Sweet watermelon, Forzini hybrid squash, Formanova beet, Garnet beet, Minetto lettuce, Princess Anne blackeye southern pea, and Roma V F tomato.

All-America Selections. All-America Rose selections for the 1966 planting included two hybrid teas and a floribunda. American Heritage, one of the hybrid teas, is ivory yellow tinged with red. The mature flower is up to 5 inches across and has 50 petals. It was hybridized by Dr. Walter Lammerts and introduced by Germains. Matterhorn, a white hybrid tea, is vigorously free blooming and has long-stemmed flowers. It was introduced by Armstrong Nurseries. Apricot Nectar, a large-flowered floribunda with apricot-colored blooms, is the ninth All-America floribunda developed by hybridizer Eugene S. Boerner and introduced by Jackson and Perkins.

All-America flower selections for 1966 included the first gold-medal winner in 27 years—Sunset cosmos, the first red variety of this commonly yellow annual. Other winners also represented color breakthroughs—Red Monarch, the first solid red sweet william, and Amethyst, the only skyblue dwarf verbenas. Spun Yellow marigold, Bright Butterflies snapdragon, and two pansies, Majestic White with Blotch and Giant Majestic Mixed, also received All-America awards.

Vegetable winners in the 1966 All-America selections were the Gold Nugget squash and Butter King lettuce.

New Books. Books published in 1965 reflected the recent trends in American gardening. Garrett Eckbo's *Urban Landscape Design* provides a creative idea source for city and community beautification, and includes many helpful illustrations. *Fluorescent Light Gardening* by E.C. Cherry provides helpful aids to indoor gardeners.

Concern over the toxic effects of many garden plants stimulated interest in *Poisonous Plants of the United States and Canada* by John M. Kingsbury, a botanist at Cornell University. Approximately 1,000 plant species are known to cause death or illness. For example, the leaves of the oleander, peach, and poinsettia are extremely toxic.

GARDNER, John W. See biographical sketch under UNITED STATES.

GAS

The marketed production of natural gas in the United States in 1964 increased by 800 billion cubic feet over 1963 (see Table 1). According to the U.S. Bureau of Mines, the marketed output in the first half of 1965 was 8,028 billion cubic feet, compared with 7,751 billion in the first half of 1964.

Consumption. Use of natural gas in the United States was 15,536 billion cubic feet, an increase of 6% over 1963. Consumption in 1964 by class of

consumer (with percentage of change from 1963) was (in billion cubic feet): residential, 3,787 (up 6%); commercial, 1,375 (up 8%); industrial (excluding gas used in the field and in carbon black), 8,174 (up 8%); field use, 2,093 (up 1%); and carbon black, 107 (down 9%).

¹ Excluding gas used for repressuring, as well as gas flared, vented, or otherwise wasted. ² Including gas for repressuring and gas wasted. ³ Estimate. (Source: U. S. Bureau of Mines.)

Gross injections to underground storage in 1964 totaled 1,015 billion cubic feet, with withdrawals totaling 885 billion, for a net increase in storage of 130 billion cubic feet.

Shipments. Interstate shipments in 1964 totaled 9,428 billion cubic feet—an increase of 4% over 1963. Exports of gas totaled 20 billion cubic feet (a 17% increase over 1963), of which 9,763 billion went to Canada and 9,840 billion went to Mexico. Imports of natural gas in 1964 totaled 443 billion cubic feet (9% more than in 1963), including 391 billion from Canada and 52 billion from Mexico. The value of natural gas at the wellhead in 1964 was \$2,387,689,000, for an average of 15.4 cents per thousand cubic feet. (See also FEDERAL POWER COMMISSION; PETROLEUM.)

¹ Gasworks only. ² Vienna only. ³ Data not available on a comparable basis. ⁴ Sales (in 1963 about 44% of total production). ⁵ Including Saar. ⁶ Approximately 95% of total production. ⁷ Beginning in 1964, gas produced and purchased by gasworks (in 1963 about 88% of total production). ⁸ Coke-oven gas. (Source: Monthly Bulletin of Statistics, November 1965. United Nations, N.Y.)

Europe. Gasfields were discovered in France, Italy, and Austria in 1964, and discoveries in the Netherlands increased estimated Dutch reserves to 39 trillion cubic feet of gas, or 40 times the total annual consumption in the Netherlands.

BERENICE B. MITCHELL
Supervisory Statistical Officer, Division of
International Activities, U.S. Bureau of Mines

GENETICS

The 1965 Nobel Prize in physiology and medicine was awarded to three French scientists—François Jacob, André Lwoff, and Jacques Monod—for their research on the genetic regulation of gene action in viruses and bacteria. Their work was done at the Pasteur Institute of Paris. (See also NOBEL PRIZES.)

Other advances in genetics in 1965 included the test tube synthesis of RNA genes, further determination of the composition of a specific gene, and studies of methods to repair gene mutations.

Anatomy of a Gene. Transfer ribonucleic acid (tRNA) is a polyribonucleotide composed of a relatively small number of ribonucleotide units joined together to form a single chain. Therefore, tRNA has been investigated intensively to elucidate its structure. In 1965, R.W. Holley and his associates isolated from yeast a type of tRNA that transports an amino acid called alanine. They found that this type of tRNA contains 77 ribonucleotide residues and that its sodium salt has a molecular weight of 26,600. They were also able to determine the complete nucleotide sequence in this type of tRNA. This is the first time that a complete sequence of a polyribonucleotide has been determined.

The usual types of bases (molecular subunits) in RNA include adenine (A), uracil (U), cytosine (C), and guanine (G). Some of the 77 ribonucleotide residues in tRNA contain other bases. These include hypoxanthine, 1-methylhypoxanthine, pseudo-uracil, 5-methyluracil (thymine, or T), 5, 6-dihydrouracil, 1-methylguanine, N³-dimethylguanine, and a mixture of uracil and 5, 6-dihydrouracil.

All of the RNA in a cell is normally produced by the transcription of double-stranded deoxyribonucleic acid (DNA) templates. (The process of synthesizing nucleic acids from nucleic-acid templates is called transcription). Therefore, the studies directed by Holley also have elucidated most, if not all, of the sequence of the deoxyribonucleotides that comprise the gene whose transcript is this type of tRNA.

Repairing Mutations. It has been known that ultraviolet radiation is powerful in producing gene mutations. Some ultraviolet-induced mutations of genes probably involve either the breakage of nucleic-acid strands or the conversion of cytosine (C) to uracil (U). However, it is now known that a large fraction of the ultraviolet-induced mutations is due to other reactions. These reactions cause two identical adjacent bases to become chemically linked and, therefore, to form a dimer (a compound composed of two identical subunits). Dimers of thymine (T), cytosine (C), and uracil (U) are produced.

In 1965, investigations by R.B. Setlow, W.L. Carrier, R.P. Boyce, P. Howard-Flanders, and others showed that mutations based on dimer formation can be repaired in two ways. In the first, the two subunits of a dimer unlink and change back to the original two monomers of T or C or U. This occurs after a dimer is exposed to ultraviolet radiation that has a shorter wavelength than the radiation that was used to induce the dimer formation. This decomposition also occurs when a dimer is exposed to visible light in the presence of an enzyme. In the second way, an enzyme excises the dimer from the strand that contains it. It is probable that the undamaged strand of the double-stranded nucleic acid then acts as a template for the enzymatic synthesis of a normal segment for the defective region where the dimer was excised.

The second way is important because recovery from similar cross-linking mutations that are induced by a chemical substance—a nitrogen mustard—also may involve the same repair mechanism. Such an error-correcting mechanism is important in the preservation of genetic information, and perhaps also in the recombination of genetic material under normal conditions.

Gene Synthesis. DNA synthesized *in vitro* was found to be biologically active in 1963. In 1965, S. Spiegelman and coworkers were able to synthesize *in vitro* replicas of the RNA genetic material of a bacteriophage. These replicas are biologically active; this is proved by their ability to infect their bacterial host and produce mature bacteriophage. Not only is biologically active RNA synthesized *in vitro*, but the RNA product is indistinguishable from the original RNA used as the template. (See also BIOCHEMISTRY.)

GEOGRAPHY AND EXPLORATION

Although natural forces continued to alter the earth's surface in 1965, faster-moving political events caused most of the map changes. Three new nations were established as independent states: The Gambia, in western Africa; Singapore, which seceded from Malaysia; and the Maldives Islands, in the Indian Ocean.

Place Name Changes. In England, reorganization of the Greater London area, approved by Parliament in 1963, took concrete shape with the creation of a new London County by adding parts of Essex, Kent, Surrey, and Hertfordshire, and all of former Middlesex County.

In Canada, the Hamilton River and Grand Falls in Labrador were renamed Churchill River and Churchill Falls in honor of Sir Winston Churchill.

Volcanic Changes. Surtsey, the volcanic isle that blasted forth from the sea off Iceland in 1963, increased by about one acre a day in 1965, attaining an area of some 2.5 square miles. American and Icelandic scientists, working under sponsorship of the U.S. Office of Naval Research, are studying Surtsey to see how life gradually takes hold there. As the land surface cools, bacteria and molds will flourish. Green algae already have appeared.

An ownership dispute has arisen in Hawaii over sea-front land created by the eruption of Kilauea volcano in 1960. The upheaval deposited 600 acres between beach-front properties at Hilo and the sea's edge. Individuals claimed the new land and paid taxes on it, but in 1965 Hawaii's deputy attorney general upheld state ownership.

Exploration. Valiant mountaineers continued to challenge Mount Everest, the world's loftiest and most inhospitable mountain. Following in the footsteps of British, Swiss, and American expeditions, Indians outdid them all in May 1965 by sending four teams totaling nine men to the 29,028-foot summit. There they found the aluminum flagpole which had been left on May 1, 1963, by the American climber James W. Whittaker and Nawang Gombu, a Nepalese Sherpa guide. As Gombu was a member of India's first team, he has the distinction of being the only man in history to climb Everest twice.

On the opposite side of the world, the highest previously unscaled mountain in North America was

UPI (ABOVE); BLACK STAR (RIGHT)

SENATOR ROBERT F. KENNEDY (right) stands at the summit of 13,905-foot Mount Kennedy (above), the Canadian peak named for his brother, the late president. He scaled the peak on March 24, 1965.

climbed on March 24, 1965. It had been named for the late President John F. Kennedy in 1964 by the Canadian government. Mount Kennedy's snow pinnacle thrusts 13,905 feet high, just east of the Alaska-Yukon border in the St. Elias Mountains. Mount Kennedy and neighboring peaks were discovered by Dr. Bradford Washburn while leading the 1935 National Geographic Society Yukon Expedition to map some 5,000 square miles of unknown terrain. In the spring of 1965 the society and the Boston Museum of Science sponsored Dr. Washburn's mapping-climbing expedition to Mount Kennedy. Climbers who made the first ascent included Senator Robert F. Kennedy, the late president's brother; and James W. Whittaker and Barry W. Prather, who were members of the 1963 American Mount Everest Expedition.

At the bottom of the earth, American scientists made a 900-mile journey across Antarctica, verifying a Soviet report that a mountain range lies buried beneath the continent's mantle of snow and ice near the South Pole. The United States concluded one of its most successful Antarctic seasonal operations with the return home in April 1965 of Rear Adm. James R. Reedy's Task Force 43, comprising nearly 3,700 officers and men. Admiral Reedy guided the first direct flight from Australia to Antarctica, the route being from Melbourne to the South Pole and thence to Byrd Station in Marie Byrd Land. A sixth American base, Palmer Station on Anvers Island, was constructed for biological and glaciological research. (See also ANTARCTICA.)

In the Arctic, famed ice island Arlis II broke up and passed into polar history. The drifting island, first sighted in April 1959 by Canadian surveyors, may have been a fragment from Ellesmere Island's ice shelf. In 1961 the United States established a

research station on Arlis II. Propelled by wind and current, the island carried Americans and visiting scientists from many countries some 5,000 miles about the Arctic Ocean. It meandered two or three miles a day on the average. Personnel had to be evacuated from Arlis II before June 1965 when the diminishing island floated into the Greenland Sea on its way to the warmer North Atlantic and oblivion. (See also ARCTIC REGIONS.)

Applied Geography. Professional geographers in the United States were called increasingly into community and regional planning under such new federal programs as the Public Works and Economic Development Act of 1965. Geographers brought to urban-renewal programs and the antipoverty program in Appalachia a sophisticated sense of how human beings are affected by their surroundings. They also fostered a greater awareness of the interrelated actions that can be taken to promote an upsurge in local and regional growth.

Academic Geography. Eminent geographers became involved in elementary and secondary geographic education in 1965 to a greater extent than ever before. Under Title XI of the National Defense Education Act, more than \$2 million was spent during the summer for the Advanced Institutes of Geography. The chief objective of the institutes is to improve the proficiency of geography teachers at the elementary and secondary school levels, and to keep them acquainted with the latest procedures and research.

National Atlas. The first maps of the new *National Atlas of the United States*, eagerly awaited by professional geographers, were scheduled to be published by early 1966. The first plates depict both the physical characteristics and the historical

development of the United States. They include the country's geology, land forms, and territorial growth. The project was undertaken in fiscal year 1963 by the U.S. Geological Survey.

U.S. Board on Geographic Names. The board observed its 75th anniversary September 2. In a ceremony commemorating the founding, Interior Secretary Stewart L. Udall said the board's work in standardizing hundreds of thousands of names has saved servicemen's lives and "fantastic amounts of money." Observing that oceanography is a rapidly developing science, he added: "Names are needed for previously uncharted and unnamed features of the ocean floors. New kinds of features that are being discovered require new terms and definitions." An advisory group to the board is now concentrating on this and related problems.

National Geographic Society. The society made grants for 40 new and continuing explorations and research projects in 1965. One grant went to Capt. Jacques-Yves Cousteau, the French undersea pioneer, for a new type of lightweight one-man submarine that can descend to 10,000 feet—far deeper than the range of Cousteau's "diving saucer."

National Geographic added the new dimension of color television to its magazine and book publishing activities in the fall of 1965. *Americans on Everest*, the first of four hour-long films of exploration and discovery scheduled for the 1965-66 season, was telecast September 10 on the CBS network and won enthusiastic critical acclaim.

Two new natural history books were published by National Geographic: *Wondrous World of Fishes*, describing and illustrating 340 species found in North American and Hawaiian waters; and *Water, Prey, and Game Birds of North America*. As a public service, the society continued its program of producing books about the nation's institutions and shrines. It contributed the photography, art, and editorial services for *George Washington: Man and Monument* and *Equal Justice Under Law: The Supreme Court in American Life*. The two books were published respectively by the nonprofit Washington National Monument Association and the Foundation of the Federal Bar Association. Maintaining close cooperation with the White House Historical Association, the society produced *Presidents of the United States of America* as a companion volume to the earlier *White House Guide Book*.

The society's Geographic Research Department helped the National Aeronautics and Space Administration choose a site for a big "eye chart" on the ground to help test the vision of orbiting astronauts. The plan to lay out vast eye charts—in the form of ground squares in checkerboard pattern with some panels marked in a white material—was developed after several astronauts reported seeing geographic features of the earth in surprising detail. Following a survey, the society recommended a site in western Australia that NASA inspected and found to be excellent.

American Geographical Society. In 1965 the society published "Surface Circulation on the Continental Shelf off Eastern North America Between Newfoundland and Florida," folio 7 in its *Serial Atlas of the Marine Environment*. Two new folios

BIRTH OF AN ISLAND is watched by scientists as they approach the smoking vent of a volcano off coast of Iceland near two-year-old Surtsey Island in the background.

"VINLAND" WORLD MAP, drawn about 1440, went on display at Yale University on Oct. 12, 1965. It is the only known map made before Columbus' first voyage that shows part of the New World. The island at far left is labeled Vinland, the part of North America discovered by the Viking, Leif Ericson, in the 11th century.

were published in the *Antarctic Map Folio Series: "Aeronautical Maps for the Antarctic" and "Physical Characteristics of the Antarctic Ice Shelf."*

Conferences. The 8th General Assembly of the Pan American Institute of Geography and History met in Guatemala City from June 25 to July 10. The Consultation on Geography prepared a list of specific projects to be undertaken in priority sequence as funds become available. Among them are studies in resources inventory and use, urban redevelopment and planning, a glossary of geographic terms, and a more effective publications program.

THE NATIONAL GEOGRAPHIC SOCIETY

GEOLOGY

Photographs of the Martian surface taken by the Mariner 4 spacecraft in 1965 provided important new data on the history of Mars. New data on the evolution of life on earth were obtained by analyses of fossils found in ancient rocks. Active exploration of the earth's subsurface continued in 1965.

Astrogeology. The Mariner 4 pictures of Mars, covering about 1% of the planet's surface, show 70 craters, 2.5 to 75 miles in diameter. If the photographed area is a representative sample of the entire surface of the planet, there are some 10,000 craters on Mars.

The expected number of craters would be very much greater than the number estimated from the Mariner 4 data if the Martian surface were very old. The apparent discrepancy between the expected number and the estimated number suggests that the craters on Mars are comparatively young—perhaps no more than 300 to 800 million years old. (The planet itself is estimated to be 4.5 billion years old—the same age as that estimated for the earth.) If the craters are 300 to 800 million years old, it may be that older craters were never

formed, perhaps because the earlier Martian atmosphere was dense enough to block meteor impacts. Another hypothesis is that water or some other agent eroded craters during the first 3.5 or 4 billion years of Mars' existence.

The weakness or absence of a magnetic field that could trap particles near Mars indicates that high-energy particle interactions are generated near or below the Martian surface, rather than in the atmosphere, as on earth. If this is true, then the production of radioactive and stable isotopes is concentrated beneath the surface of Mars.

The Mariner 4 data on the thinness of the Martian atmosphere indicate that it is transparent to ultraviolet radiation. The polar caps (not photographed by Mariner 4) are very good reflectors of ultraviolet radiation, as is snow. Other seasonal color changes (reddish to greenish) could be produced by radiation-induced movements of electrons. These electrons might move into certain silicate structures during the winter and move out of them during the summer.

Lack of water in the present Martian atmosphere, intensity of solar radiation, production of radioactive isotopes near and immediately below the surface, and atmospheric transparency to ultraviolet radiation decrease the possibility that even the more simple organisms, such as bacteria, spores, fungi, viruses, and protozoa, can exist on Mars. However, the apparent youthfulness of the surface permits speculation that water once may have been present, that organisms once lived, and that a fossil record may exist.

No earthlike features, such as mountain chains, valleys, ocean basins, and continental masses can be recognized in the Mariner 4 photographs. Principal topographic features on Mars have originated through meteor impact rather than through deformation produced by internal stress, as on earth.

CONTINENTAL CRUST

OCEANIC CRUST

SCHLUMBERGER WELL SURVEYING CORP.

PROJECT MOHOLE, sponsored by National Science Foundation, is an effort to drill world's deepest hole to obtain the first samples of the earth's mantle (above). Schematic diagram also shows phase 1 of project, which tested feasibility of Mohole scheme. Drilling rig (left) will sink the shaft.

UPI PHOTO

The findings of Mariner 4 seem to emphasize earth's uniqueness in the solar system. (See also **ASTRONOMY**; **SPACE EXPLORATION**.)

Paleontology. Two widely separated rock formations that are more than 2.7 billion years old almost certainly contain materials of organic origin. The Soudan Formation, near Tower, Minn., contains hydrocarbons that very probably are remains of primitive organisms. The Dolomite Series, near Bulawayo, Southern Rhodesia, contains the oldest known structures that are directly analogous to structures built by the activity of much later organisms. It is generally accepted that the organisms that produced the forms in the Dolomite Series are closely related and possibly ancestral to modern algae.

Well-preserved microfossils in the base of the Gunflint Iron Formation (1.9 billion years old) along the north shore of Lake Superior include septate and nonseptate threads, cellular-walled spheroids, and perforate spheroids. These fossils are believed to be ancestral to or near relatives of certain bacteria and blue-green algae. The fossils provide evidence that photosynthetic organisms evolved at least two billion years ago.

Porphyrin derivatives of chlorophyll associated with these photosynthetic organisms are evidence that oxygen was becoming available, at least in the vicinity of the photosynthetic organisms. Thus, this may have been a time when the atmosphere was in an intermediate stage of evolution toward the oxygen-rich atmosphere that had developed by the beginning of the Cambrian period or perhaps earlier.

The base of the Nonesuch Formation (one billion years old) near White Pine, Mich., contains crude oil, optically active alkanes, porphyrins, isoprenoid hydrocarbons, and microfossils of several types. The presence of porphyrins suggests that organisms that existed at this time were metabolically similar to living forms.

A find in late Precambrian rocks of the Bitter Spring Formation (estimated to be 700 to 900 million years old) near Alice Springs, Australia, includes well-preserved algal filaments and aggregates of single cells in chert. They bring the record close to the time that abundant fossils occur.

Transcontinental Geophysical Study. The U.S. Geological Survey is mapping the subsurface structure of the United States. The survey, which extends from coast to coast and into deep ocean water, will map subsurface structure to depths ranging up to 600 miles. Subsurface mapping is accomplished by boring holes, setting off explosives, and using seismographs to measure the shock waves.

Mohole. In 1965 the National Science Foundation announced plans to begin construction of a drilling platform for the Mohole project. The platform, which is expected to be completed in 1968, will be located in the ocean about 100 miles north of Maui, Hawaii. The goal of the project is to place a shaft down to the ocean floor, at a depth of about 2.5 miles, and then to drill through about 3.2 miles of sediment and crustal rock to obtain samples of the earth's mantle.

Professor and Chairman, Department of Geology
The University of Kansas

GEORGIA

Racial strife in Georgia in 1965 touched all areas of state life—schools, churches, housing, politics, and business. White reprisals against Negroes who took part in racial demonstrations often took the form of loss of jobs, eviction from homes, and foreclosures on mortgages. In some instances, white sympathizers with the Negroes suffered similar reprisals. Among the cities hardest hit by racial strife were Americus, Crawfordville, Lincolnton, Savannah, and Washington—all located in either central or southern Georgia.

Integration. The all-white schools in Taliaferro County were closed for the 1964-65 school year to avoid integration. The county's white children and a few Negro children were transported by bus to schools in adjoining counties.

The 2,000-member congregation of St. John's Episcopal Church in Savannah, the largest in the state, voted in April to withdraw from the Episcopal Diocese of Georgia in an effort to bypass integration of their church.

Elections. In a special election on June 16, called to implement the reapportionment of state election districts, the Democratic party lost 13 seats to the Republicans in the Georgia House of Representatives. Eight Negroes won seats. When the legislature convened in January 1966, the new 205-member House of Representatives had 185 Democrats

and 20 Republicans. In the Democratic primary run-off election for alderman in September, Q.V. Williamson of Atlanta, a Negro, defeated Jimmy Vickers, alderman of the 3rd ward, by a margin of more than three to one. In the November election, Williamson became the first Negro elected to the city board of aldermen since the 1870's.

Voting Rights Act. The population of Georgia is composed of slightly more than 3 million whites and approximately 1.2 million Negroes. In 35 counties Negroes outnumber whites, and in 30 counties the ratio is nearly equal. With the implementation of the federal Voting Rights Act of 1965, the number of Negroes holding office at state, county, and municipal levels is expected to increase.

Loyalty Oath. The Georgia chapter of the American Civil Liberties Union, on behalf of the American Association of University Professors and 165 Georgia college teachers, brought suit against the state in connection with the wording of a loyalty oath. As a result, the oath was altered to conform more nearly to the wishes of the professors.

Sports. Owners of teams in the National Football League, meeting in New York City in June, voted to add Atlanta to their schedule in 1966. The Atlanta team will play its home games in the city's new \$18 million stadium. The Atlanta Braves National League baseball team also planned to play their 1966 home season in the new stadium.

Legislation. In the Georgia General Assembly in 1965, the Senate enacted 95 bills, and the House of Representatives, 463.

Legislation enacted included a statute that makes it unlawful to sell or exhibit obscene literature to any person under the age of 18. Another bill requires certain medical personnel to report any cases that they discover of cruel treatment of children, and grants them immunity from any civil or criminal liability for making such reports.

An education bill created a Georgia Scholarship Commission for the purpose of granting scholarships for paramedical training to qualified Georgia residents who otherwise would not have the funds to finance a program of study.

JOHN C. MEADOWS

Professor of Sociology, The University of Georgia

ATLANTA'S NEW STADIUM will be the home of the city's new professional baseball and football teams.

ATLANTA CHAMBER OF COMMERCE

GEORGIA: Information Highlights

Area: 58,876 square miles.

Population: 4,312,000 (1965 est.).

Chief Cities (1965 est.): Atlanta, the capital (535,000); Savannah (141,000); Macon (128,000); Columbus (125,000); Augusta (67,000); Albany (64,000); Athens (42,500); East Point (41,000).

Government: Chief Officers—governor, Carl E. Sanders (Democrat); lt. gov., Peter Z. Geer (D); secy. of state, Ben W. Fortson, Jr. (D); atty. gen., Arthur K. Bolton (D); treas., Jack B. Ray; supt. of schools, Claude L. Purcell; chief justice, William H. Duckworth. **Legislature**—General Assembly (convened January 1965); Senate, 54 members (44 Democrats, 9 Republicans, 1 Independent); House of Representatives, 205 members (198 D, 6 R, 1 vacancy).

Education: School enrollment (1964-65)—public elementary, 716,349 pupils (23,108 teachers); public secondary, 363,515 pupils (15,146 teachers); nonpublic schools, 30,200 pupils (1,280 teachers); college and university (fall 1964), 69,527 students. **Public school expenditures** (1964-65)—\$312,518,000 (\$330 per pupil); teacher's average salary, \$5,050.

Public Finance (fiscal year 1964): Revenues, \$833,044,000 (sales tax, \$185,424,000; motor fuel tax, \$99,597,000; federal funds, \$214,171,000). **Expenditures**, \$761,286,000 (education, \$301,631,000; health, welfare, and safety, \$122,356,000; highways, \$164,943,000). **State debt**, \$16,000.

Personal Income (1964): \$8,345,000,000; average annual income per person, \$1,943.

Public Assistance (fiscal year 1965): \$102,834,115 to 191,426 recipients (aged, \$62,758,736; dependent children, \$18,553,347).

Labor Force (employed persons, July 1965): Agricultural, 100,200; nonagricultural (wage and salary earners), 1,233,100 (32% manufacturing, 21% trade, 18% government). **Unemployed persons** (July 1965)—50,800.

Manufacturing (1963): Value added by manufacture, \$2,102,332,000 (transportation equipment, \$515,766,000; primary metals, \$34,653,000; nonelectrical machinery, \$91,281,000; electrical machinery, \$73,499,000; fabricated metals, \$106,758,000; food and products, \$437,756,000).

Agriculture (1964): Cash farm income, \$905,258,000 (livestock, \$459,072,000; crops, \$406,770,000; govt. payments, \$39,416,000). **Chief crops** (tons)—corn for grain, 1,961,568 (ranks 12th among the states); peanuts, 403,200 (rank, 1st); cottonseed, 257,000 (rank, 8th); tobacco, 62,198 (rank, 6th); sweet potatoes, 51,000 (rank, 5th); peaches, 43,200 (rank, 6th); rye, 23,520 (rank, 9th).

Mining (1964): Production value, \$127,958,000. **Chief minerals** (tons)—iron ore, 396,000 (ranks 11th among the states); barite, 109,228 (rank, 4th); clays, 4,365,000.

Fisheries (1964): Commercial catch, 18,338,497 pounds (\$2,973,071). **Leading species**—crabs, 11,531,863 pounds (\$471,819); shrimp, 5,938,731 pounds (\$2,298,136).

Transportation: Roads (1963), 96,260 miles (57,962 paved); motor vehicles (1964), 1,879,000; railroads (1963), 5,745 miles; civil aircraft (1964), 2,213 (161 airports).

Communications: Telephones (1965), 1,575,300; television stations (1964), 11; radio stations (1964), 173; newspapers (1965), 31 (1964 daily circulation, 1,059,028).

GERMAN LITERATURE

The best works published in 1965 show how far German literature has risen above the chaotic negativism that followed World War II. In returning to the essence of poetic art—concentration, imagery, and form—German belles lettres is finding a sane equilibrium and has contributed greatly to the development of a new spiritual milieu in Germany.

Fiction. Several outstanding collections of stories were published in 1965. Jack Bilbo's *Das geheime Kabinett der sonderbaren und grauenvollen Geschichten* reflects the anarchic adventures that form the core of his earlier autobiography, *Rebell aus Leidenschaft*. The stories are partly true and partly fictional. Each, however, is a perfect reflection of the author's grotesque humor, rooted in the realm of the absurd and the horrific.

The central elements of Edzard Schaper's *Gesammelte Erzählungen* are catchwords of metaphysical quality—freedom, conscience, faith, guilt, grace. Nevertheless, he treats them totally in literary fashion. Dialogue is seldom employed, the author preferring indirect discourse. Everything is cast in parable form, the importance of which lies in the theological-metaphysical truth that shines through the external action, rendering transparent the actual "reality" behind the events.

The anthology *Vor dem Leben*, compiled by Martin Gregor-Dellin, is subtitled *Schulgeschichten von Thomas Mann bis Heinrich Böll*. This collection has both pedagogical and literary value, because the stories reflect not only the literary development of the modern German, but his political and social maturation. The basic theme of the stories might be epitomized: "from tyrant-professor to comrade." It traces the attitude of the contemporary German toward authority, as embodied in formal education.

Among the important novels of 1965 was Karl Garbe's *Soldbuch*. It revives the horrors of the last days of World War II in the daily life, the reveries of the past, and the fearful hopes of the future of the undoubtedly autobiographical hero. Essentially an act of courage on the part of the author,

Soldbuch might have been subtitled "Lest We Forget."

Ernst Weiss' *Der arme Verschwender* was originally published in the Netherlands in 1936. Rediscovered in 1965, it represents the German-Jewish literature that Hitler sought to destroy. The novel, obviously semiautobiographical, is written in diary form. It portrays the psychological crisis of a young doctor torn between the need to honor his father's wishes and the desire to assert his own individuality.

Poetry. Hermann Kasack's interest in the Chinese element in art, in China, and in all things Chinese is reflected in his *Wasserzeichen*. This collection of poems envisions man as still an organic part of nature, and employs a free rhythm reminiscent of oriental meditations. Marie Luise Kaschnitz' *Gedichte* shows a decided change in her outlook on life and her fellowmen. Grief now preponderates in a world that is inimical and full of wounds; the roses are now gray. Her lyric expression is more precise and perhaps more meaningful. In every poem her principal concern is the future possibilities of man as a social being whose quest for God has cast before him the inescapable choice between despair and hope.

Agnes Miegel's *Gedichte, Erzählungen, Erinnerungen* can best be described as the expression of her most poignant characteristics: rootedness in the East Prussian homeland of her forebears and in their inherited customs; a gentle faith interspersed with symbolic, almost secretive, traits; and a simple direct clarity of expression. In this collection of poetry and prose, the memories of her lost home show no trace of bitterness. They are vivified in the poetic creation of characters and fateful situations, all of which glow with a warm and intimate love of nature.

Nonfiction. Memoirs, essays, and a reference work on German literature head the list of outstanding books of nonfiction published in 1965.

Former chancellor Konrad Adenauer's memoirs were serialized in German newspapers during the year and appeared in book form in October.

A second edition of Albert Schweitzer's *Die Weltanschauung der indischen Denker: Mystik und Ethik* appeared in 1965, the year of the author's death. In this book Schweitzer tries to make intelligible to the West the great personalities of Indian thought, the problems that engaged them, and the ideas they represent—especially the basic negation of life that seems so strange to the occidental mind. (See SCHWEITZER, ALBERT.)

In *Goethe und der französische Geist*, subtitled *Versuch einer Synthese*, Albert Fuchs attempts to demonstrate in the most favorable light Goethe's relationship to France and its culture. The attempt is driven to extremes, however. Suspicious of every form of blatant nationalism, Goethe could hardly have been sympathetic towards the rampant chauvinism of the Napoleonic period. Nevertheless, Fuchs' study contains many valuable insights.

Handbuch der deutschen Gegenwartsliteratur, edited by Hermann Kunisch, is a useful reference book of contemporary German literature. The work of all writers between 1910 and the present is discussed in 470 alphabetically arranged monographs with complete bibliographies. Also included are articles on style, on historical phenomena, and on new literary tendencies.

WEST GERMANY · Information Highlights

Area: 95,928 square miles.

Population: 58,587,000 (Dec. 31, 1964 est.).

Chief Cities (1964 est.): Bonn, the capital, 214,500; West Berlin, 2,192,700; Hamburg, 1,856,500; Munich, 1,182,400.

Government: President—Heinrich Lübke (elected July 1, 1959; reelected July 1, 1964); Chancellor—Ludwig Erhard (elected Oct. 16, 1963; reelected Oct. 19, 1965). Parliament—Upper House (Bundesrat), 45 members; Lower House (Bundestag), 498 members; party seating (1965)—Bundestag: Christian Democratic Union and the Christian Social Union (CDU-CSU), 247; Social Democratic party (SPD), 202; Free Democratic party (FPD), 49.

Religious Faiths: Evangelical Church, 51% of population; Roman Catholics, 44%; others, 5%.

Education: Literacy rate—99% of population. Total school enrollment (1963)—8,637,037 (primary, 5,115,048; intermediate, 457,540; secondary, 794,217; teacher-training, 44,963; vocational, 2,036,135; university, 189,134).

Finance (1963): Revenues, \$21,600,000,000; expenditures, \$21,100,000,000; public debt, \$8,300,000,000; monetary unit, Deutsche Mark (4 DM equal U.S.\$1).

Gross National Product (1964): \$103,425,000,000.

National Income (1964): \$78,825,000,000; average annual income per person, \$1,352.

Economic Indexes (1964): Industrial production, 149 (1958=100); agricultural production, 127 (1956-57=100); cost of living, 114 (1958=100).

Manufacturing (metric tons, 1964): Crude steel, 37,339,000; cement, 24,789,000; gasoline, (1963), 8,176,000; wheat flour, 3,444,000; meat, 3,007,200; sugar, 2,140,000; plastics and resins, 1,744,800; wine, 661,000.

Crops (metric tons, 1964): Potatoes, 20,624,000 (ranks 3rd among world producers); sugar beets, 13,000,000 (world rank, 4th); wheat, 5,202,000 (world rank, 10th); barley, 3,915,000 (world rank, 6th); rye, 3,609,000 (world rank, 3rd); oats, 2,308,000 (world rank, 4th); grapes, 920,000; apples, 1,216,000.

Minerals (metric tons, 1964): Coal, 255,879,000 (ranks 5th among world producers); iron ore, 11,614,000 (world rank, 11th); salt, 5,796,000 (world rank, 5th); zinc, 95,823 (world rank, 12th); lead, 48,921 (world rank, 15th); gypsum, 1,155,000 (world rank, 10th); barite, 442,599 (world rank, 2nd); silver, 1,990,835 troy ounces (world rank, 16th); crude petroleum, 55,419,000 barrels (world rank, 20th).

Foreign Trade (1964): Exports, \$16,221,000,000 (chief exports, 1963: nonelectrical machinery, \$3,299,000,000; motor vehicles, \$1,910,000,000; electrical machinery, \$1,173,200,000; iron and steel, \$1,145,700,000); imports, \$14,618,000,000 (chief imports, 1963: fruits and vegetables, \$868,900,000; nonelectrical machinery, \$835,900,000; textile yarn, fabrics, \$768,100,000). Chief trading partners (1963): U.S. (took 7% of exports, supplied 15% of imports); France (took 11% of exports, supplied 11% of imports); The Netherlands (took 10% of exports, supplied 9% of imports).

Transportation: Roads (1964), 234,878 miles (135,459 paved); motor vehicles (1964), 10,358,942 (automobiles, 8,274,163); railways (1963), 22,160 miles; merchant vessels (1964), 840 (4,789,000 gross registered tons); national airline, Lufthansa; principal airports, Berlin, Düsseldorf, Frankfurt, Hamburg, Munich.

Communications: Telephones (1964), 7,599,571; television stations (1964), 109; television sets (1964), 10,000,000; radios (1963), 17,099,000; newspapers (incl. regional editions, 1963), 1,128 (daily circulation, 18,175,000).

PICTORIAL PARADE

WEST GERMAN ELECTIONS on Sept. 19, 1965, brought nation's three leading politicians together in lively campaign. Former Chancellor Konrad Adenauer (center), chairman of the Christian Democratic Union, speaks for Chancellor Ludwig Erhard (left), who defeated Willy Brandt (right), Socialist mayor of West Berlin.

election of a new government again headed by Chancellor Ludwig Erhard loomed larger in the events of 1965 than West Germany's foreign relations. The country's economic growth exceeded the impressive record of the immediately preceding years.

Prosecution of Nazi Criminals. West Germany announced on Nov. 11, 1964, that the prosecution of Nazi criminals had been carried out as far as possible. The government indicated that it did not intend to extend the Statute of Limitations, which restricted indictments for crimes, including murder, to a 20-year period after the alleged crimes had been committed. The government held that it would be contrary to the principles of lawful government to change such a statute arbitrarily; therefore no indictments were to be made after May 8, 1965.

WILLY BRANDT, the Socialist mayor of West Berlin, attempted unsuccessfully in 1965 to win election as chancellor of West Germany. After his Social Democratic party lost the elections of September 19 to incumbent Chancellor Ludwig Erhard's Christian Democratic Union, Brandt announced that he would not run again for chancellor in 1969.

Brandt was born as Herbert Frahm in Lübeck, Germany, on Dec. 18, 1913. He began contributing to a Socialist newspaper when he was 17 and continued to work as a journalist, using the name Willy Brandt, after he fled to Norway in 1933 to escape arrest by the Nazis. When the Nazis invaded Norway in 1940, Brandt went to Sweden and took Norwegian citizenship. He returned to Germany as a news correspondent in 1945 and resumed his German citizenship in 1948. Again active in the Social Democratic party, he was elected to the federal parliament in 1949 and to the post of mayor of West Berlin in 1957. He ran unsuccessfully for chancellor against Konrad Adenauer in 1961.

A great deal of criticism, from both inside and outside Germany, was leveled against this decision. Jewish organizations in the United States demonstrated in front of German diplomatic missions, and the press in the United States and in other countries severely criticized the German proposal.

It was debated in the Bundestag on Dec. 9, 1964. A joint motion of the Christian Democrats and the Social Democrats, which was approved by a large majority, urged the government to ask the public for further evidence regarding Nazi crimes. In carrying out this mandate, the government obtained some new evidence, particularly from Poland.

The Bundestag debated the matter again in a session that impressed observers by the seriousness and weight of the members' arguments. A bill was introduced under which the Statute of Limitations would be extended 10 years beyond the May 8, 1965, expiration date. But it seemed doubtful that the bill, which would have required a two-thirds majority, could be passed. Some opposed it on the ground that 20 years was long enough for Germany and the world to focus on the Nazi period. Others felt that such a bill involved an arbitrary tampering with established law.

The Bundestag finally agreed that the 20-year Statute of Limitation should run from Dec. 31, 1949, the date on which West German courts were completely freed from Allied control. This bill was passed on March 25, 1965, by a vote of 364 to 94. It permits indictments to be made until Dec. 31, 1969. Prosecutions will continue even beyond that date in cases in which indictments have been obtained. Dr. Ewald Bucher, a member of the Free Democratic Party (FDP), resigned as minister of justice since he considered the bill unconstitutional. A Christian Democrat, Dr. Karl Weber, was appointed to replace him on April 1.

Intra-Party Strife. The year 1965 witnessed a great deal of internal feuding within the chief government party, the Christian Democratic Union (CDU), and its Bavarian counterpart, the Christian Social Union (CSU). The principal bone of contention was the handling of Franco-German relations. Former Chancellor Konrad Adenauer, the party chairman of the CDU, and Franz Josef Strauss, the country's former defense minister and the chairman of the CSU, were critical of West Germany's policy toward France under the direction of Chancellor Ludwig Erhard and his foreign minister, Dr. Gerhard Schroeder. They felt it endangered the friendly relations with President de Gaulle that Adenauer had established while he was chancellor. Adenauer and Strauss wished to follow de Gaulle in building a European federation that would be essentially independent of the United States. But the majority of the CDU-CSU, as well as the Free Democratic Party (FDP), the other party represented in the government, and the opposition party, the Social Democratic Party (SPD), wished to see NATO maintained in its present form, the European Common Market (EEC) further integrated, and the Atlantic community strengthened. De Gaulle had not helped his cause in West Germany by his extreme criticism of the European Common Market, of NATO, and of U.S. policies in general.

Elections. West German politics in 1965 were largely dominated by the parliamentary elections that took place on September 19. The party exchanges during the campaign were moderate, although the campaign literature was less restrained. Foreign policy was not a major issue between the two major parties. The reform of public education and the expansion of schools and universities attracted more general attention. But even on these issues the two contending parties were not far apart. The Social Democratic party, which since 1959 has been transforming its Socialist policies into mild reformist ideas, was handicapped by not being able to differentiate clearly its political aims from those pursued by the CDU and CSU. The Social Democrats pinned their hopes for victory on the new set of leaders they were offering the electorate, trusting that the West German people would consider the time ripe for a change after 16 years of CDU-CSU rule. But obviously the West German public, living in prosperity, was willing to overlook the personal shortcomings, the occasional mistakes, and the lack of determination of the Erhard government. (See ERHARD, LUDWIG.)

The victory of the CDU-CSU constituted a great personal triumph for the chancellor, the more so since many of his own party had predicted that the party, though gaining the plurality, would pull fewer votes than in the elections of 1961. Even the federal president, Dr. Heinrich Lübke, had believed that the Social Democrats would run a close second to the CDU-CSU. He apparently was prepared to recommend a coalition government formed by the CDU-CSU and the Social Democrats to replace the CDU-CSU coalition with the Free Democrats. The formation of such a "great coalition" government was supported by all the opponents of Chancellor Erhard, but Erhard opposed it. He garnered for the CDU-CSU a vote larger than that won in 1961 by Dr. Adenauer. On the other hand, the Social Democrats, whose chief standard bearer was the mayor of Berlin, Willy Brandt, were particularly disappointed in not securing so much as 40% of the total vote.

In the September election the CDU-CSU won 47.6% of the vote (compared with 45.3% in 1961), the Social Democrats 39.3% (36.2% in 1961), and

the Free Democrats 9.5% (12.8% in 1961). Other parties together polled less than 4%: the German Peace Union (DFU), considered to be a Communist front organization, polled only 1.3%; and the National Democratic Party (NDP), the closest to a German neo-Nazi party, received 2%. Only the CDU-CSU, the Social Democrats, and the Free Democrats won representation in the new Bundestag with 247, 202, and 49 members, respectively.

The new Bundestag held its first meeting on October 19 and elected Dr. Eugen Gerstenmaier as president, an office he had held in former sessions of the Bundestag. Immediately after the election the old feud among the governing Christian Democrats broke into the open again. Adenauer admitted after the election that Erhard, whom he considers to be no statesman, could not be unseated as chancellor. But, together with Franz Josef Strauss, he tried to remove Schroeder as foreign minister, considering him too pro-American and pro-British, as well as anti-French. This attempt failed since Erhard and the party caucus again chose Schroeder for that post. Strauss then tried to get the chairman of the FDP, Dr. Erich Mende, excluded from his former position as minister of all-German affairs. This ministry had been created to give Mende the opportunity to deal with problems of German reunification, which the FDP has made its special domain. The chancellor vacillated for some time since he was four votes short of a majority in the Bundestag, but in the end he retained Mende in his old office. On October 20 the Bundestag elected Erhard chancellor again with a majority of 272 votes to 200, with 15 abstaining. On October 26 he presented to the Bundestag his new cabinet, consisting of 12 CDU, 5 CSU, and 4 FDP ministers.

Nuclear Defense. The build-up of a multilateral nuclear force (MLF), which the U.S. government had proposed and the West German government had accepted in 1964, remained in the discussion stage. When it had become clear that the MLF had met with the strongest French resistance, President Johnson directed the U.S. Department of State in December 1964 not to push the proposal. The United States could not even count on Britain, which preferred a more loosely organized Allied Nuclear Force

VISITING WEST GERMANY in May, Queen Elizabeth II of Britain chats with President and Mrs. Lübke (left). (Right) The queen and Prince Philip view Berlin wall.

WEST GERMAN CHANCELLOR Ludwig Erhard (left) meets in Washington, D.C., on Dec. 20, 1965, with President Lyndon Johnson (right). Between them are German Defense Minister von Hassel (left) and Foreign Minister Schroeder.

(ANF) to the MLF. But by the end of 1965, Britain seemed to have dropped its own plan in order to facilitate negotiations with the Soviet Union on nuclear disarmament. The Soviet Union is totally opposed to any plan that might give West Germany a finger on the nuclear trigger. The whole problem will be reconsidered in 1966 when the newly elected West German and French governments have set their foreign policy courses.

Franco-German Relations. Relations with France remained a source of continuous worry throughout the year. There is general agreement in West Germany that relations with France should be friendly, but hardly any West German would deny that close ties with the United States are essential to West German security. The West German government, in addition, wishes to advance closer European integration, which has been blocked by President de Gaulle. The French president wants a loose European federation and the exclusion of U.S. influence from the continent. De Gaulle's position, clearly set forth at his press conference of September 9, is quite contrary to West German policy.

The West German government has emphasized its wish to go on with the integration of the Common Market countries. Similarly, West Germany has indicated that it considers NATO, to which the government has contributed all its own armed forces, of vital importance for West German national safety. The presence of the strong U.S. divisions in West Germany and the American nuclear umbrella are considered an indispensable part of its defense, whereas de Gaulle wishes to unify only Europe's armed forces, to abolish the American command, and to remove the American troops from Europe. On the other hand, he is not prepared to have West Germany participate in the direction of the French nuclear force, which is supposed to become operative in 1968. In these circumstances Franco-German relations remain under a cloud. (See also EUROPE; NORTH ATLANTIC TREATY ORGANIZATION.)

The Arab Countries and Israel. An announcement was made in East Berlin on Jan. 27, 1965, that East Germany's Prime Minister Walter Ulbricht was to pay an official visit to Cairo at the end of February. The West German government reacted with a strong statement that such a state visit would involve far-reaching changes in the relationship between West Germany and the United Arab Republic. The West German ambassador in Cairo, Dr. Georg Federer, was recalled to Bonn to report on a conversation

with UAR President Nasser on January 31, in which the ambassador had expressed serious concern at Ulbricht's forthcoming visit to the UAR. West Germany warned that if the UAR recognized East Germany, West Germany would apply the "Hallstein Doctrine." The doctrine, first formulated in 1955, stated that West Germany would not establish diplomatic relations with a country that recognized the East German regime. The only exception made was the Soviet Union.

Nasser indicated that he had invited Ulbricht only after it had been disclosed that Chancellor Adenauer had agreed in 1960 to supply Israel with arms. This agreement called for the delivery by West Germany of \$80 million worth of American arms to Israel. These arms were originally given to West Germany by the United States and were being replaced in West Germany by more modern weapons.

West Germany assured the UAR that the delivery of arms to Israel, though 80% completed, would not be continued. He announced that in place of the remaining 20% of the West German-Israel contract, civilian goods or credits would be supplied. On February 15, Israel's Prime Minister Levi Eshkol strongly protested this cancellation of the arms deliveries as being a "surrender" to President Nasser's "blackmail." Ulbricht visited Egypt from February 24 to March 2, and some economic agreements were drawn up involving two East German credits totaling over \$100 million.

On March 7 the West German government announced that it desired to place its relations with Israel on a normal basis. It added that this move was not directed against any Arab state. Simultaneously it called Ulbricht's reception in Egypt a "provocation" and announced the cessation of West German economic aid to the UAR. Dr. Kurt Birrenbach, a member of the Foreign Affairs Committee of the Bundestag, arrived in Jerusalem on March 7 as Chancellor Erhard's special emissary for talks with Prime Minister Eshkol and the foreign minister, Mrs. Golda Meier. After he returned to Bonn on March 14, it was announced that the Israeli cabinet had approved in principle the immediate establishment of diplomatic relations with the Federal Republic of Germany. The decision was approved by the Knesset on March 16 by a vote of 66 to 29, with 10 abstentions. Birrenbach visited Jerusalem again between March 17 and 23, and returned on April 6 for final talks.

The establishment of diplomatic relations between the German Federal Republic and Israel came into effect on May 12 with an exchange of letters between Erhard and Eshkol. The two countries agreed that the balance of the shipments would consist of civilian supplies. When payments under the 1952 reparations agreement between West Germany and Israel had been completed, the West German government was to negotiate with Israel about further economic aid. Early in July the Israeli government accepted Dr. Rolf Pauls as the first West German ambassador to Israel. The West German government simultaneously accepted Asher Ben-Nathan as Israel's first ambassador to West Germany.

The Arab reaction to the establishment of diplomatic relations between West Germany and Israel was heated but ultimately indecisive. The foreign ministers of the Arab League states met in Cairo on March 14-15 and agreed on the immediate withdrawal of all Arab ambassadors from Bonn. However, only 10 of the 13 Arab states did so; Morocco, Tunisia, and Libya maintained their relations with West

Germany. There was little support for the breaking off of economic relations with West Germany, and only 6 of the 13 Arab League States—the UAR, Iraq, Yemen, Algeria, Sudan, and Kuwait—were reported to favor the recognition of East Germany. But no such action was taken. The UAR elevated its consulate in East Berlin to consulate general status, but fell short of establishing an embassy. Although 10 West German ambassadors were withdrawn from Arab League states, the West German government declared that the Arab League states would be allowed to maintain consulates in West Germany if they wished. It was also said that the West German government would continue its economic aid to the Arab world and expected to keep open the two West German consulates at Alexandria and Aleppo.

Economic Developments. The West German economy in 1965 continued to expand. In 1964 the national production was 413.4 billion Deutsche marks (DM), or 9.7% higher than in the year before. (In 1963 the growth was only 6.3%.) In the first eight months of 1965 industrial production was 7.2% greater than in the comparable period in 1964. Strong incentives for expansion came to a large extent from the growing consumption sparked by higher incomes, which had risen 10.5% in the first half of 1965. But not all of the income was spent. The German Federal Bank estimated that savings would be a fifth or a quarter greater than the high level of savings in 1964.

The rise in consumption was one of the chief reasons for the substantial growth of imports, which reached 45.3 billion DM. The value of exports reached 46.2 billion DM during the first eight months of 1965. This indicates an increase of 20.7% in imports and 10.1% in exports, compared with 1964. However, since the average prices of imports and exports in the period were 3% higher than in the comparable period in 1964, the volume of trade was not as big as these figures suggest. The volume increase in imports was 19% and in exports 7%. The active balance of trade in the first eight months of 1965 amounted to 0.9 billion DM, compared with 4.7 billion in 1964.

Foreign Capital Investment. As in other European countries, the problem of foreign capital investment in European industries was debated in West Germany. One study revealed that the foreign capital in West Germany is not chiefly American, although the numbers of U.S. firms operating in West Germany rose from 350 in 1957 to 1,100 in 1965. Of these, 400 are producing goods in West Germany. But of the more than 11 billion DM of foreign capital, only 40% is American, while 17% is Dutch, 16% Swiss, 9% British, and 7% French.

Altogether 16% of the capital invested in West German corporations is foreign-owned. Among the various branches of industry, only the oil industry is practically a foreign monopoly, with U.S. companies owning 40%, and the Dutch and British together controlling 50% of the West German industry. About 40% of the food-processing industry is in foreign hands. Of that total, Dutch companies own 40%, the Swiss 25%, and U.S. companies 20%.

In individual industries, however, U.S. products play a large part. In business machinery and electronics the impact is greatest. The U.S. firm International Business Machines in 1964 controlled 76% of the market, followed by the Remington Co. with 9%. Siemens, the second largest of all the West German industrial corporations, was third with a modest 5%. In the first half of 1965 about 40% of

all the new automobiles manufactured in West Germany were built by the American-owned firms in West Germany of the Ford Motor Company and Opel (General Motors).

It is not likely that the Federal Republic will follow France and Switzerland in imposing restrictions on foreign investments. West Germany has welcomed foreign capital because it has contributed substantially to the rebuilding and expansion of the West German economy. Moreover, through contact with foreign industries, West Germany has become familiar with modern products and production methods. It is often stated that the American firms in particular have brought much technical progress to West Germany.

Wages, Employment, and Prices. Wages in West Germany have risen between 1953 and 1965 by 100%, or four times as much as in the United States. (However, West German wages were exceedingly low at the beginning of this period.) Wages continued to climb during 1965.

Employment reached a new peak in 1965. At the end of August there were 720,300 jobs open and only 85,700 unemployed (0.4% of the national labor force). About 1,164,000 foreign workers were employed in West Germany, 360,000 of whom were Italians. The next largest groups were Greek, Spanish, and Turkish. The Yugoslavs, Dutch, and Austrians also were well represented.

Prices rose in West Germany in 1965, especially agricultural prices, which increased when abnormally cold and rainy spring and summer delayed the harvest of vegetables and fruits. In July 1965, food prices were 12% higher than in July 1964. The prices for industrial products, however, rose by only 2.1%.

West Berlin. With the help of the West German Republic, West Berlin has continued to be politically strong and economically prosperous. The city has recorded a slight increase in population and has enjoyed a larger production increase, relative to its size, than West Germany.

UPI

EAST GERMANY
(GERMAN DEMOCRATIC REPUBLIC)

East Germany made impressive gains in industrial production in 1965. But this Soviet puppet state was forced to siphon off some of its wealth to the Soviet Union through trade agreements weighted heavily in favor of the USSR.

Defections to the West. Dissatisfied with the Communist regime, East Germans continued to make daring escapes to the West. Between Aug. 13, 1961, the day the wall between East and West Berlin was built, and July 1, 1965, 61 persons were killed while attempting to escape over the wall, and 56 were killed along the West and East German frontier. Altogether 433 members of the East German armed forces fled to West Berlin.

Elections. For the first time since 1961, elections took place for country, town, and city assemblies. Altogether 245,000 representatives were elected. As in the past, the voter could vote only for a single list composed by the Communist Party (SED) and its affiliated organizations. One change had been introduced in the election system to make it appear more democratic: the voter was allowed to strike out candidates. However, any candidate who received 50% of the general vote was considered elected. The participation in the election was 99.90% of eligible voters, a little less than the 99.97% recorded in 1961. Only two candidates on the party list were not elected.

Economic Developments. In the first six months of 1961 there was a remarkable 6% increase in the gross national product of East Germany. A 7% rise in productivity was recorded in industry. Trade in foodstuffs and luxury goods enjoyed a 3% increase. The rise in productivity resulted from the policies introduced in the fall of 1963, requiring that individual factories be run on a profit basis and that special material incentives for managers and workers be used to fulfill targets set by the economic plan. This seems to have decreased the power of political functionaries in industry and to have raised the status of engineers and technicians.

In the first half of 1965, incomes rose by only 4%, lagging behind the rising productivity, but creating

Area: 41,814 square miles.
Population: 17,011,931 (prelim. census, Dec. 31, 1964).
Chief Cities (1964 prelim. census): East Berlin, the capital, 1,071,462; Leipzig, 595,203; Dresden, 503,859; Karl-Marx-Stadt, 293,549.
Government: Chairman of the Council of State—Walter Ulbricht; Minister President—Willi Stoph. Parliament—People's Chamber, 434 members.
Religious Faiths: Protestants, 80% of population; Roman Catholics, 11%; others, 9%.
Education: Literacy rate—99% of population. Total school enrollment (1963)—2,843,923 (primary, 2,202,496; secondary, 76,544; technical-vocational, 486,478; higher, 78,405).
Finance (1963): Revenues, \$25,500,000,000; expenditures, \$25,400,000,000; monetary unit, Ostmark (2.22 Ostmarks equal U.S.\$1).
Net Material Product (1964): \$36,500,000,000.
Economic Indexes: Industrial production (1964), 149 (1958=100); cost of living (1963), 98 (1958=100).
Manufacturing (metric tons, 1964): Cement, 5,771,000; crude steel, 3,852,000; gasoline (1963), 1,316,000; sugar, 856,000; butter, 172,800; cotton yarn, 61,000; aluminum, 45,000.
Crops (metric tons, 1964): Potatoes, 12,020,000 (ranks 4th among world producers); sugarbeets (1963), 6,176,000 (world rank, 8th); rye, 1,575,000 (world rank, 4th); barley, 1,406,000 (world rank, 12th); oats (1963), 728,000 (world rank, 12th); wheat (1963), 1,280,000.
Minerals (metric tons, 1964): Salt, 2,000,000 (ranks 11th among world producers); gypsum, 258,000 (world rank, 20th); coal (1963), 2,483,000; copper, 28,000 (world rank, 18th); tin, 732 (world rank, 16th); nickel, 100 (world rank, 14th); silver, 4,800,000 tray ounces (world rank, 10th).
Foreign Trade (1963): Exports, \$2,673,000,000 (chief exports: machinery, vehicles, lignite briquettes); imports, \$2,287,000,000 (chief imports: coal, lignite, coke). Chief trading partners: USSR (took 47% of exports, supplied 50% of imports); Czechoslovakia (took 8% of exports, supplied 9% of imports); West Germany (took 9% of exports, supplied 8% of imports).
Transportation: Classified Roads (1963), 28,300 miles; motor vehicles (1963), 366,700 (automobiles, 185,000); railways (1963), 10,040 miles; merchant vessels (1964), 76 (480,000 gross registered tons); airline, served by Interflug; principal airport, East Berlin.
Communications: Telephones (1964), 1,515,271; television stations (1964), 15; television sets (1964), 2,580,000; radios (1962), 5,670,000; newspapers (1963), 34.

a reserve for further expansion.

Trends in foreign trade were less favorable in the first half of 1965. Only a 4% increase was achieved. The greater variety of goods produced in East Germany was primarily the result of the boosted investment in the production of capital goods, which surpassed the previous year's level by 8%. Plant building was most pronounced in the power industry and in the chemical industry. Private consumption rose by only 4%, but a demand for a greater range of goods was fulfilled. Clothing was more easily obtainable, although some gaps in supplies still existed. Restrictions were lifted on meat sales, but butter continues to be rationed. Trade between East and West Germany in 1964 reached its highest level, with exports from the East reaching a value of 1,110 million DM, and those from the West totaling 1,190 million DM.

GHANA

The ministry of local government in Ghana announced on June 3 that the general elections for the National Assembly scheduled for June 9 would not be held, since all 198 candidates nominated by the Convention People's Party (CPP), the only party permitted in Ghana, were unopposed. After the National Assembly met on June 10, it unanimously elected Kwame Nkrumah to his second five-year term as president. President Nkrumah immediately announced his new cabinet, which included the appointment as foreign minister of Alex Quaison-Sackey, formerly ambassador to the United Nations and president of the UN General Assembly during its 19th session.

Domestic Affairs. President Nkrumah had solidified his power earlier. On February 1 the post of executive secretary of the CPP was abolished and the ad-

GHANA'S PRESIDENT NKRUMAH (r.) was host to meeting of the Organization of African Unity, in Accra, October 21. Nkrumah (shown with President Sekou Touré of Guinea) urged Britain to use troops to prevent Rhodesia's independence, and warned of the consequences of independence.

ministration of the national headquarters became Nkrumah's direct responsibility because of his position as the party's general secretary.

On February 8, at their second trial, five men accused of treason in connection with an attempt in August 1962 to assassinate President Nkrumah were sentenced to death. At their first trial, in December 1963, three of them were acquitted—former ministers Tawia Adamafio and Ako Adjei and the former executive secretary of the CPP, Hugh Coffe-Crabbe. The presiding judge at the first trial Chief Justice Sir Arku Korsah, was dismissed by Nkrumah, and the verdict was annulled under a

Minerals (metric tons, 1964): Manganese (exports), 495,030 (ranks 7th among world producers); bauxite (exports), 268,000 (rank, 18th); gold, 864,917 troy ounces (rank, 6th); gem diamonds, 267,000 carats (rank, 8th); salt, 31,000; silver (1963 exports), 4,827 troy ounces.
Foreign Trade (1964): Exports, \$292,000,000 (chief exports: cacao, \$191,300,000; wood, \$41,500,000; diamonds, \$17,200,000; manganese, \$12,200,000); imports, \$340,000,000; (chief imports, 1963: nonelectrical machinery, \$57,300,000; motor vehicles, \$23,900,000; printed cotton fabrics, \$21,100,000). Chief trading partners (1963): Britain (took 20% of exports, supplied 33% of imports); U.S. (took 18% of exports, supplied 6% of imports); West Germany (took 11% of exports, supplied 10% of imports); the Netherlands (took 11% of exports, supplied 7% of imports); Italy (took 8% of exports, supplied 7% of imports).
Transportation: Roads (1964), 20,629 miles (2,183 paved); motor vehicles (1964), 47,683 (automobiles, 27,424); railways (1963), 589 miles; merchant vessels (1964), 14 (90,000 gross registered tons); national airline, Ghana Airways; principal airports, Accra, Kumasi, Takoradi, and Tamale.
Communications: Telephones (1964): 30,741; television stations (1964), 3; radios (1963), 505,000; newspapers (1962), 3 (daily circulation, 201,000).

retroactive bill giving the president power to reverse special court decisions in the interest of national security.

On February 4, Joseph B. Danquah, veteran nationalist leader and Nkrumah's opponent in the 1960 presidential elections, died in a Ghanaian detention camp.

Censorship was tightened in February when a committee was established to inspect publications in bookshops and libraries to ensure the removal of all writings not reflecting the ideology of the CPP. The press and radio had already been under censorship control.

Economy. Ghana's 1965 budget proved to be a surprise in view of the country's poor financial situation. It was expected that an attempt would be made to retrench in line with the seven-year development plan's emphasis on (1) full utilization of existing capacity to expand production and (2) the completion of projects already begun before starting new ones. Instead, the budget presented an accelerated development program without pruning current government expenditures.

On September 1 the \$200 million hydroelectric project at Akosombo on the Volta River went into operation. The largest single consumer of its power will be the \$280 million aluminum smelter to be completed jointly in 1967 by Kaiser Aluminum and the Reynolds Metals Company. In January, work started on an \$840,000 gold refinery at Tarkwa, a \$2.8 million fishing industry enterprise at Tema, and a \$16.5 million sugar refinery at Komenda.

Because of the sharp drop in cocoa prices during 1965, the support price paid by the Cocoa Marketing Board to farmers was decreased from \$8.40 to \$5.60 per 60 pounds.

On June 23 a new Industrial Relations Act was approved. It apparently was motivated by the government's desire to avoid foreign criticism of official trade unions in Ghana. On July 1 a new Social Security Act went into effect, empowering employers to deduct 7.5% from employees' salaries, with employers contributing 15% of the employees' salaries to the State Insurance Corporation.

On July 19, Ghana changed to a decimal currency system. The new units are the cedi and pesewa; one cedi equals 100 pesewas, or about U.S.\$1.17.

Foreign Affairs. Communist China increased its goodwill activities and technical assistance in Ghana during 1965. On May 20, China and Ghana signed a scientific cooperation agreement.

The fourth Afro-Asian People's Solidarity Conference took place at Winneba from May 9 to 16. Its delegates criticized United States policies, and its resolutions, reflecting the Communist line on world issues, concerned nonintervention by "imperialist" powers in the affairs of independent states.

The third annual conference of the Organization of African Unity took place in Accra from October 21 to 26. The conference warned Britain of the possible consequences if Rhodesia's white minority government declared its independence. British Prime Minister Harold Wilson visited President Nkrumah on October 31 and conferred with him on the Rhodesia issue. (See also AFRICA.)

UNITED STATES AND WORLD GOLD HOLDINGS

GOLD

World production of gold in 1964 increased for the 11th consecutive year, according to the U.S. Bureau of Mines. It amounted to 46.1 million fine (troy) ounces, valued at \$1.61 billion. (Revised estimates for USSR in several past years have reduced world totals.) The increase of 1.9 million ounces was derived almost entirely from the continued expansion of South African mines, which contributed 29,136,542 ounces, or about 63.2% of estimated world gold production. Colombia and Rhodesia also registered gains. (See also MINING.)

United States refinery production of gold in 1964 rose to 1,469,000 ounces—a small increase over the 1,468,750 ounces refined in 1963. The amount of gold received from placer mining continued to decrease in Alaska and California, but was offset by an increase in gold recovered as a mining byproduct of copper, lead, and zinc ores in South Dakota, Arizona, Montana, and Utah.

In the first nine months of 1965, the gold mined in the United States totaled about 1,233,185 ounces, compared with 1,059,935 ounces in the same period in 1964. U.S. exports of refined gold bullion in 1964 more than doubled, to reach 12 million ounces, valued at \$422 million. Most of the gold exported went to France.

BERENICE B. MITCHELL

International Activities, U.S. Bureau of Mines

GOLDBERG, Arthur Joseph

U.S. ambassador to the United Nations: b. Chicago, Ill., Aug. 8, 1908.

Arthur Goldberg received, in 1965, his third major appointment in five years. The new U.S. ambassador to the United Nations had served as secretary of labor and as an associate justice of the U.S. Supreme Court.

Named Ambassador. After the death of Ambassador Adlai Stevenson on July 14, 1965, President Johnson sought a successor whose appointment would reflect the importance of the United Nations. Because he wanted a man adept at dealing with people, he chose Goldberg, who gave up his lifetime tenure on the Supreme Court to accept the post.

In accepting on July 20, Goldberg said that he was deeply committed to "the effort to bring the rule of law to govern the relations between sovereign states. . . . It is that or doom—and we all know it. I have accepted, as one simply must." The Senate unanimously confirmed the appointment on July 23, and Goldberg was sworn in on July 26.

United Nations Developments. Goldberg announced on August 16 that the United States was dropping its demand that 13 countries pay the arrears on their peace-keeping assessments or lose their votes in the General Assembly, as provided in Article 19 of the UN Charter. Their refusal to pay had paralyzed an Assembly that was reluctant to force a showdown by taking any vote for the record. Goldberg's move eased tensions at the United Nations, but some congressmen criticized the alleged "surrender."

In September, Goldberg worked relentlessly behind the scenes to win Security Council support for resolutions urging that India and Pakistan stop fighting in Kashmir. Their agreement to a cease-fire was a major victory for the United Nations.

Goldberg assured his fellow delegates that the United States was eager to work within the framework of the United Nations for an end to the war in Vietnam. At the end of 1965, he and several other administration officials traveled to foreign capitals to explain the U.S. wish for an early, honorable settlement. Goldberg conferred with Pope Paul, President

Giuseppe Saragat of Italy, President Charles de Gaulle of France, and Prime Minister Harold Wilson of Great Britain. (See also UNITED NATIONS.)

Supreme Court. Goldberg resigned from the court on July 26, 1965. His appointment by President Kennedy in 1962 had reversed a previous 5-4 edge held by the advocates of judicial restraint. Justice Goldberg was prepared to override any law or previous ruling that in his view infringed on the constitutional rights of an individual.

On June 7, 1965, Goldberg wrote a separate concurring opinion that held that an anti-birth-control law was unconstitutional. He asserted that "the right of privacy in the marital relation is fundamental and basic—a personal right" guaranteed to the people under the Constitution.

Background. Goldberg, the son of Russian Jewish immigrants, received law degrees from Northwestern University in 1929 and 1930. During World War II he served in the Office of Strategic Services. In 1955 he helped secure a merger of the American Federation of Labor and the Congress of Industrial Organizations, and he then became special counsel for the AFL-CIO. While secretary of labor in 1961 and 1962, he mediated several important labor disputes.

GRAINS

United States production of the four major livestock feed grains increased to a record level in 1965—17% above 1964 and 3% above the previous high in 1963. The output of these grains—corn, oats, barley, and sorghum—rose to 160,674,000 tons, as compared with the 137,870,000 tons harvested in 1964. The nation's feed grain supply included 55,300,000 tons carried over from preceding years. The carry-over ran 13,900,000 tons less than in 1964, and 29,400,000 tons below the record set in 1961.

Feed Grains. The increase in the 1965 feed grain crop resulted from a record yield per acre for each crop—1.62 tons per acre, or 18% more than in 1964 and 25% above the 1959-63 average. However, in spite of the decreased acreage, production increased 2% for barley, 9% for oats, and 16% for corn. Sorghum rose 35%. Feed grain acreage harvested was 1% less than in 1964. To obtain government payments, farmers diverted 36,700,000 acres of feed grains to soil conservation uses.

The use of feed grains increased steadily from 1957 to a peak of 154,000,000 bushels in 1962. Use declined the following two years, but in 1965 reached a new record of 156,700,000 bushels.

The national average price support per bushel of corn, barley, and oats produced in 1965 were, respectively, \$1.25, 96 cents, and 60 cents. The rate for sorghum grain was \$2.00 per hundredweight (cwt). Under the Food and Agriculture Act of 1965, passed by Congress on November 4, the voluntary price-support and acreage-diversion programs in effect since 1961 were continued through 1969. Beginning in 1966, however, the basis for figuring price supports, cropland-adjustment payments, and compensation for land diverted to other uses will be projected yields instead of base-period yields.

Food Grains. Production of wheat, rye, and rice for human consumption increased 3% in the United States in 1965. Total production reached 44,581,000

¹Preliminary estimates for Northern Hemisphere countries; for Southern Hemisphere countries, preliminary forecasts based largely on acreage and weather conditions. Years shown refer to harvests in Northern Hemisphere. Harvests in Southern Hemisphere come early in following year. ²Excluding Communist areas. [Source: Foreign Agricultural Service, U.S. Department of Agriculture.]

tons, up from 43,330,000 tons in 1964 and 38,611,000 in 1963. Production of winter wheat, the major food grain, reached about the same amount as the 30,746,640 tons grown in 1964.

Wheat. The Food and Agriculture Act of 1965 extended the voluntary wheat acreage reduction and marketing-certificate program through 1969. Using a combination of price supports, direct payments, land-diversion payments, and marketing certificates, the farmer was guaranteed a minimum average price of \$1.84 per bushel for wheat, plus other compensation, to raise the price to 100% of parity. (In November, parity was \$2.57 per bushel.)

The U.S. crop of 1,326,747,000 bushels of wheat in 1965 exceeded that of 1964 by 3%, and the 1959-63 average by 12%. Farmers planted 56,942,000 acres in wheat—1,877,000 more than in 1964—and harvested 49,313,000 acres. Yield per acre in 1965 averaged 26.9 bushels—the second highest yield on record. The world crop estimate was 9,108,000,000 bushels.

Rye. The U.S. rye crop of 33,277,000 bushels in 1965 was slightly less than the 1964 crop, and 11% below the 1959-63 average. Acres harvested for grain totaled 1,466,000, down 14% from the previous year. The yield per acre was 22.7 bushels, or 3.2 bushels greater than the 1964 figure. The 1965 world crop totaled 1,270,000,000 bushels.

Rice. Production of rice in the United States in 1965 set a record for the fourth consecutive year. The rough rice crop totaled 76,932,000 bags (of 100 pounds each), or 5% above the previous year's record of 73,113,000 bags, and well above the 5-year average. Yields averaged a record 4,291 pounds per acre—195 pounds more than in 1964. The acreage harvested rose slightly from 1,786,000 in 1964 to 1,793,000 in 1965. The 1965-66 world crop was estimated at 164,100,000 metric tons.

Corn. Production of corn for grain in the United States in 1965 totaled a record 4,171,100,000 bushels. The average yield of 73.1 bushels per acre, also a record, was up sharply from the 62.1 bushels in 1964. The world corn crop in 1965-66—an all-time record—was estimated at 8,150,000,000 bushels.

Oats. The 1965 U.S. oat crop averaged 50.2 bushels per acre, 5.0 bushels above the previous record yield in 1963. It totaled 959,192,000 bushels—up 9% from 1964, but 8% below the 1959-63 average. World production of oats in 1965 rose to 3,075,000,000 bushels—an immense gain over the 50-year low of 881,891,000 bushels harvested in 1964.

Barley. The 1965 barley crop in the United States rose 2% from the 1964 figure, to 411,897,000 bushels, or 2% below the 1959-63 average. Yield per acre attained a record high of 43.5 bushels. World production was 4,080,000,000 bushels—down from the 4,260,000,000-bushel record of a year earlier.

Sorghum Grain. U.S. sorghum grain production in 1965 totaled 666,062,000 bushels—up 35% from 1964, and 21% above the 1959-63 average. The average yield per acre of 50.0 bushels established a new high by exceeding the 1962 record of 44.2. Acreage harvested for grain rose 11% above 1964, to 13,323,000 acres, but was 1% less than the 1959-63 average. (See also AGRICULTURE.)

BRITAIN'S QUEEN ELIZABETH II, visiting Ethiopia with the Duke of Edinburgh (right) in February, is shown Tississar Falls by Emperor Haile Selassie.

GREAT BRITAIN

The British Labour government in 1965 was able to put its policies into effect despite its small majority in the House of Commons, which varied during the year from two to three. An economic crisis dominated the scene, but government measures taken throughout the year gave the prospect of solution to the crisis in 1966. But there was no easy solution to the Rhodesian problem.

The Economy. The government directed a major effort toward the expansion of British exports. On January 19 it announced details of a tax rebate scheme for exporters; it broadened credit guarantees for exporters on January 27 and again on August 2; and on February 1 it established export councils for the principal world trading areas. The government announced exchange control restrictions in the budget of April 6, and further restrictions on July 27, when it also announced that Britain's overseas aid

GREAT BRITAIN · Information Highlights

Area: 93,605 square miles.
Population: 54,066,000 (June 30, 1964 est.).

CAMERA PRESS

MICHAEL STEWART was almost unknown outside Britain when he succeeded Patrick Gordon Walker as British foreign secretary on Jan. 22, 1965. But he had long been a spokesman for the inner circle of the Labour party and is highly respected for his intellect and strength of character.

(Robert) Michael Stewart was born in London on Nov. 6, 1906. A scholarship student at St. John's College, Oxford, he graduated with honors in 1929. He taught school from 1930 until 1942 when he entered the army; in 1944 he was commissioned and promoted to captain. He was elected Labour MP from East Fulham (now Fulham) in 1945, and became parliamentary secretary to the Supply Ministry in the 1945-51 Labour government. In 1961-62 he represented Britain in the Council of Europe and the Western European Union. When the Labour party returned to power in 1964, he became secretary of state for education and science. One of Britain's most literate public men, he is the author of *The British Approach to Politics*, which went into a fourth edition in 1961.

would be temporarily limited.

The budget for 1965-66 aimed principally at a \$100 million reduction in domestic consumption; to this end the government increased taxes and excise duties. It increased installment-buying down payments on June 3, and reduced the time for the completion of installment payments on July 27. On February 22 it announced that the growth in government expenditures would be limited to an average of 4.25% a year until 1970. It postponed for six months many projects that had been previously approved, and limited defense expenditure to \$5.6 billion at 1964 prices.

A National Board for Prices and Income, set up on March 17 by agreement between the government, management, and the unions, advised on April 8 that price increases were to be avoided and reductions made where possible, and that incomes should not increase by more than 3 to 3.5%. On September 2 the board announced that price and pay increases must be deferred until it had reported on them.

The National Plan, a coherent framework for the whole series of measures taken by the government, was published on September 16. Its main objectives are: (1) to remove the balance of payments deficit and achieve the surplus needed to repay recent borrowing (see below, *Finance*); (2) to speed up the rate of growth of output and achieve a 25% increase in national output by 1970; and (3) to get a better regional and social balance in the use of the country's resources. The government is committed to taking such action as may be necessary to fulfill the objectives of this plan.

Changes in Leadership. Following his defeat in a by-election at Leyton, Patrick Gordon Walker, Labour foreign secretary, who had lost his seat at Smethwick in the general election of 1964, resigned on January 22 and was succeeded by Michael Stewart. Anthony Crosland succeeded Stewart as secretary of state for education and science.

On February 25 the Conservative party adopted new machinery for selecting a leader, and this was used when Edward Heath replaced Sir Alec Douglas-Home, who resigned in July in the face of criticism.

Legislation. Among the important legislation passed in 1965 was a measure directed against discrimination in public places and incitement to racial hatred—the Race Relations Act, which became law on November 8. The Science and Technology Act, which became law on March 23, reorganized civil science and technology in Britain, and the new Science Research Council came into being on April 1.

The legislative program for the new parliamentary session, contained in the queen's speech on November 9, and foreshadowed by policy statements during the year, called for (1) a parliamentary commissioner for administration, (2) the establishment of a

land commission with compulsory power to acquire land (the subjects of white papers on September 23 and October 12), and (3) the expansion of social and other services. Although a white paper on steel nationalization had been published on April 30, Prime Minister Harold Wilson explained to the House of Commons on November 10 that legislation to give it effect would have to wait until after more pressing social legislation had been completed.

Relations with the United States. The British government supported U.S. policy in Vietnam in spite of some criticism within Britain. It welcomed U.S. intervention in the Dominican Republic as a protection for British nationals and interests there, but felt that the situation eventually should be handled by the United Nations.

Among the British ministers visiting the United States in 1965 was Foreign Secretary Michael Stewart, who was in Washington for talks on world problems with U.S. Secretary of State Dean Rusk on March 21 and 22; and Chancellor of the Exchequer James Callaghan, who was in Washington for discussions on June 28-29, and was there again between September 27 and October 1 for the meetings of the IMF (International Monetary Fund). Prime Minister Wilson addressed the Economic Club of New York on April 14, had discussions in Washington with President Lyndon Johnson on April 15, and returned to New York and Washington in December for further discussions (see *WILSON, HAROLD*).

Robert McNamara, U.S. secretary of defense, visited London on May 30, and Henry Fowler, U.S. secretary of the treasury, was in London during the course of his visit to seven European countries in early September.

Relations with the Soviet Union. Britain and the Soviet Union signed a new cultural agreement in Moscow on February 13. Covering the years 1965-67, it provides for expanded cooperation in culture, sports, science, and technology. The Soviet foreign minister, Andrei Gromyko, visited London from March 16 to 20 to hold discussions with Foreign Secretary Stewart and Prime Minister Wilson. The two nations signed a five-year agreement on agricultural research in London on January 6. Britain joined France and the United States on April 7 in sending notes to the Soviet government demanding cessation of Communist interference with communications with West Berlin and protesting Communist flights over Berlin.

Anglo-German Relations. Prime Minister Wilson visited Berlin on March 6, and, with Foreign Secretary Stewart, was in Bonn from March 7 to 9. In Bonn they discussed the problem of German reunification with Ludwig Erhard, West German chancellor. On June 28 and 29 in Bonn, John Diamond, chief secretary to the British Treasury, reached an

EDWARD HEATH succeeded Sir Alec Douglas-Home as leader of the Conservative party on July 28, 1965. He was the first Conservative party leader to be elected to the post, each of his predecessors having been appointed by the outgoing party leader. He is a dedicated politician resolved to give as good as he gets in the rough and tumble of parliamentary debate.

Edward Richard George Heath was born in Broadstairs, Kent, on July 9, 1916. He won a scholarship to Balliol College, Oxford, and graduated in 1939. He entered the army as a private in 1940 and rose to lieutenant colonel of artillery in 1945. A member of the Conservative party since his university days, he was elected to Parliament from Bexley in 1950. He advanced in successive Conservative governments and, as lord privy seal, worked unsuccessfully in 1961-63 for Britain's entry into the European Economic Community (Common Market). In 1963-64 he was Douglas-Home's secretary of state for industry, trade, and regional development, and president of the Board of Trade.

CAMERA PRESS

agreement with Rolf Dahlgrün, West German finance minister, on arrangements for offsetting the costs of British armed forces stationed in Germany.

The outstanding event in Anglo-German relations was the official visit to Germany of Queen Elizabeth II and the Duke of Edinburgh from May 18 to 28. Wherever they went they received a tremendous welcome.

Anglo-French Relations. Wilson and Stewart also visited Paris on April 2 and 3. Their discussions with French President Charles de Gaulle and his advisers ranged over a wide field. At a meeting in London on May 17, the British defense secretary, Denis Healey, the British minister of aviation, Roy Jenkins, and the French ministers of defense and of transport, Pierre Messmer and Marc Jacquet, signed a memorandum of understanding on the joint development of an advanced training aircraft and of an aircraft with variable geometry (wings that are swept back in flight and extended on take-off).

Other overseas visits by British ministers during the year included the prime minister's official visit to Rome from April 27 to 29, and the foreign secretary's visits to Yugoslavia from April 18 to 22, to Czechoslovakia from April 23 to 25, and to Poland from September 17 to 21. Janos Peter, the Hungarian foreign minister, visited Britain from June 30 to July 4, and the shah of Iran visited Britain from March 1 to 11.

Commonwealth Relations. Two major issues confronting the Commonwealth in 1965 were the measures taken by the British government to deal with the problems arising from immigration into Britain,

and the situation in Rhodesia, which made an illegal unilateral declaration of independence on November 11. Commonwealth heads of government discussed both problems at a meeting held in London from June 17 to 25. (See COMMONWEALTH OF NATIONS; RHODESIA).

Royal Family. Members of the royal family made a number of visits overseas during the year. In addition to Germany, Queen Elizabeth II and the Duke of Edinburgh visited Ethiopia from February 1 to 8 and the Sudan from February 8 to 12. Queen Elizabeth, the queen mother, visited Jamaica from February 18 to 26, Canada from June 23 to 27, and West Germany from July 12 to 16. Princess Margaret and the Earl of Snowdon visited Uganda from March 13 to 23, the Netherlands from May 14 to 19, and the United States from November 4 to 24, following which they stopped briefly in Bermuda. The Duke of Edinburgh toured Saudi Arabia (February 12-15), Malaysia (February 17-19 and February 27-March 6), Australia (February 20-26), Thailand (March 6-9), India (March 9-12 and 15-21), Nepal (March 12-15), Pakistan (March 21-23), and Bahrain (March 24). Princess Alexandra and her husband visited Japan from September 17 to October 3.

Ceremonies. Queen Elizabeth unveiled a memorial to President John F. Kennedy at Runnymede on May 14. Present for the ceremony were Mrs. Jacqueline Kennedy and her children, Senators Robert and Edward Kennedy, and other distinguished guests, including the prime minister and former Prime Minister Harold MacMillan. U.S. Secretary of State Dean Rusk, representing President Johnson, accepted

SIR WINSTON CHURCHILL, who died on Jan. 24, 1965, received a state funeral on January 30. The solemn procession leaves the gates of Westminster Hall, where he had lain in state, on its way through the London streets to St. Paul's Cathedral for funeral services.

CENTRAL PRESS

the three acres of land at Runnymede to be held in perpetuity by the United States.

Britain celebrated the 750th anniversary of the sealing of Magna Carta on June 10 with a thanksgiving service at St. Paul's Cathedral, London, and on June 15 with a ceremony at the Royal Courts of Justice. Englishmen honored the anniversary of Simon de Montfort's parliament, the beginning of parliamentary government in Britain, in a ceremony at Westminster Hall on June 22.

Space Research. In the early part of 1965 the government made extensive modifications at the British earth station at Goonhilly, Cornwall. The changes cost about \$2 million, which was the approximate cost of the original station. The improvements are intended to meet the demands of commercial communications satellites, the first of which is Early Bird, launched by the United States on April 6 from Cape Kennedy, Fla.

Defense. The Labour government's first annual statement on defense, issued in February, proposed the expenditure of \$5,937.4 million for 1965-66, an increase of 2.3% over the previous year. It also announced a review of defense commitments. The minister of defense, Denis Healey, said on August 4 that the government's target was to return by 1969-70 to the 1964-65 level of defense expenditure, that is, no more than \$5,600 million, at constant prices. In the first nine months the government had gone half way to its goal by making such changes in the equipment program as the cancellation of the TSR 2 aircraft and a fourth Polaris submarine; by the reorganization of the reserve program; and by a careful scrutiny of weapons production. (See also AERONAUTICS; MISSILES.)

The basic principles guiding the deployment of Britain's forces are (1) to retain in overseas theaters the minimum force to fulfill commitments; and (2) to hold a strategic reserve in Britain, with the air transport necessary to reinforce any area of the world at maximum speed. The deployment of British manpower throughout the world is broadly as follows: United Kingdom, 241,000; West Germany (including Berlin), 62,000; Mediterranean, 23,000; East of Suez, 72,000 (including 14,000 Gurkhas); elsewhere, 9,000—a total of 407,000 troops.

Atomic Energy. Of great importance to the future of the nuclear power program was the decision to use the British-designed AGR (advanced gas-cooled reactor) for the first of the second-generation electricity-generating stations, Dungeness "B" (in Kent). The AGR was chosen because of its reliability and lower operating cost. The minister of power, Frederick Lee, announced the decision on May 25, 1965, after bids had been submitted for both AGR and water-moderated reactors. The new station, to be completed in 1970, will have an output of 1.2 million kilowatts.

The Science and Technology Act of 1965, which became law on March 23, allows the AEA (Atomic Energy Authority) to undertake some research and development not involving atomic energy. The AEA has assumed responsibility for desalination research and development. It is working with the Medical Research Council on centrifuges, and with ESRO (European Space Research Organization) on the payload of a rocket.

Assets of the AEA on March 31, 1965, totaled \$1,202 million. The annual profits on such AEA trading activities as the manufacturing of nuclear fuel and the supplying of radioisotopes is about \$84 million a year. (See also ATOMIC ENERGY.)

Finance. The budget introduced on April 6 estimated revenue for 1965-66 at \$25,272,800,000 and expenditure at \$23,749,600,000, leaving a surplus of \$1,523,200,000. Expenditure estimates included \$6,246,800,000 for defense, \$5,334,000,000 for health and welfare, \$2,616,000,000 for economic services, and \$739,200,000 for education.

Britain's balance of payments, which showed a deficit of \$218,400,000 in 1963, was also in heavy deficit through 1964, and though there was some improvement in the fourth quarter of the year, the overall deficit reached \$2,086,000,000. Because of drastic measures taken by the government, however, the position improved in the first half of 1965, when the deficit over the six-month period was \$285,600,000, compared with \$873,600,000 in the corresponding period of 1964. The government restricted expenditures, increased taxation, and continued the import levy, although it reduced the levy from 15% to 10% on April 17. It also announced on February 11 that it was renewing the \$3 billion credit facilities arranged in November 1964.

To strengthen the pound in the exchange markets, the Bank of England announced on September 10 that it had made credit arrangements with the central banks of Austria, Belgium, Canada, West Germany, Italy, Japan, the Netherlands, Sweden, Switzerland, the U.S. Federal Reserve Bank, and the Bank for International Settlements. As a result of the improving position, the bank rate, which had stood at 7% since Nov. 23, 1964, decreased to 6% on June 3.

Gold and dollar reserves of the sterling area amounted to \$2,791,600,000 on June 30, 1965, compared with \$2,704,800,000 on June 30, 1964, and \$2,315,600,000 on Dec. 31, 1964. On Dec. 31, 1965, they totaled \$3,004,400,000.

Taxation. The standard rate of income tax for individuals and corporations, raised to 41.25% in the November 1964 supplementary budget, was continued for the year 1965-66. Two ninths of the first \$11,214 of an individual's earned income is exempt from tax, plus one ninth of the balance up to \$27,846. Additional exemptions are \$616 for a single person, \$952 for a married couple, and \$322 to \$462 for children according to age. Surtax is payable on gross income over \$5,600 at rates varying from 10 to 50%, abated by various reliefs and certain special allowances.

Corporations are taxed at the standard income tax rate on the whole of their profits, and must pay an additional 15% profits tax on earnings over \$5,600 a year. A 30% capital gains tax for individuals was introduced in the 1965-66 budget. A company's capital gains will be charged against the corporation tax also introduced in the 1965-66 budget, and will not be more than 40%.

A sales tax is charged on a wide range of goods at one of three rates—10, 15, or 25%.

External Trade. Britain's trade deficit rose sharply in 1964, averaging \$123.2 million a month, compared with \$11.2 million a month in 1963. A steady rise in the first three quarters of 1964 was halted in the fourth, when exports increased while imports remained at about the same level. Exports, at \$12.3 billion, were higher than in 1963, higher prices and increased volume making about equal contributions to the increase. Re-exports totaled \$428 million. Imports rose strongly during the first half of 1964, but leveled off in the second half, for a total of \$15.4 billion, 15% more than in 1963. More than half of this increase was in industrial materials; the

remainder was in food, consumer goods, and machinery and other capital equipment.

In the first half of 1965, exports showed a 4% increase, for a six-month total of \$6.5 billion, while imports decreased by 1%, for a six-month total of \$7.99 billion. Re-exports in the same period were \$231.8 million. The trade deficit was consequently running much lower than the 1964 level, at an average rate of \$72.8 million a month. The chief commodity export increases were electrical machinery (6%), metals and miscellaneous metal manufactures (6%), transport equipment (5%), and other machinery (4.5%). Exports of basic materials fell by 12% compared with a year earlier, and exports of fuels, particularly coal, by 3.5%.

Food imports fell by 6%, finished manufactures by 1.5%, and imports of basic materials by 1%. Consumer goods showed a generally decreasing pattern, clothing and footwear falling by 25%. Petroleum increased by 13% and machinery and transport equipment by 4%. In the third quarter of the year, the average monthly rate of exports rose by 5%, imports remaining at about the same level as in the second quarter. The monthly trade deficit averaged \$75.6 million during the quarter, but fell to \$64.4 million in September.

Industrial Production. It was estimated that industrial production in 1964 was 7.6% higher than in 1963. In the first half of 1965, production averages were substantially higher. Steel production in 1964 totaled 26,234,000 tons, or 14.5% higher than in 1963. Production of passenger cars rose 14% to a total of 1,868,000 units; commercial vehicles increased 13%; and machine tools, 6%.

Agricultural Production. Production of most agricultural crops, with the exception of oats and vegetables, increased in 1964. Arable land in June 1965 totaled 18,382,000 acres, of which 6,551,000 acres were in temporary grassland. Animals on agricultural holdings at the same date totaled 30,015,000 sheep, 11,992,000 cattle, and 8,065,000 pigs. The total poultry population was 115,406,000.

Education. On Feb. 24, 1965, the secretary of state for education and science, Anthony Crosland, announced that the government proposed to expand existing universities and other institutions of university status to accommodate 218,000 university students by 1973-74. With the possible exception of a new technological university in the northeast, no new universities would be created in the next 10 years. Instead of establishing new advanced technological institutions, it would expand the technological departments of existing universities. On February 1 the government announced that its grant to the universities, administered through the university grants committee, would be increased by \$16.24 million through 1966-67. The amount of the grant for 1965-66 is thus \$278.04 million, and for 1966-67, \$307.44 million.

On July 12, Crosland outlined acceptable forms of organization for comprehensive schools and asked local education authorities to submit plans for their areas within a year. This was the first step toward the creation of a comprehensive system of secondary schools. A program of research into various methods of organizing and running comprehensive schools was announced on September 30.

By means of the queen's speech at the opening of Parliament on November 9, the government announced its intention to integrate the public (private) schools more closely into the national system of education.

WIDE WORLD

THE BEATLES display Order of the British Empire medals presented to them by Queen Elizabeth on Oct. 26, 1965.

Health Services. The cost to the government of the health and welfare services was estimated at \$2,556.4 million in 1965-66, compared with an estimated cost of \$2,332.4 million in 1964-65. In each of the past three years the government allocated between 12.4 and 12.8% of the national budget to health and welfare services. During 1964, the number of medical doctors decreased by 0.5%, though the enrollment in medical schools increased. During both 1964 and 1965, there was increasing dissatisfaction by members of the medical profession both with the conditions of general practice and with the remuneration of physicians engaged in it. There was a notable growth in hospital building, with capital expenditure rising by \$56 million during the year to \$156.8 million. A 500-bed general hospital was opened in Cumberland, and a 500-bed mental hospital near Newport, Monmouthshire. Scotland spent over \$16.8 million on hospital building in 1963-64, completing 10 major building projects.

Transport. In 1964, British railroads reduced their working deficit by \$39.48 million to an annual figure of \$189 million. Although increased revenue accounted for about \$14 million of the reduction, economies made in the operation of the railroads were the major factor in this deficit reduction. Capital investment of \$392.4 million during the year was concentrated on increasing the number of diesel locomotives and on signaling and electrification schemes. In 1965 the government approved 123 proposals in its continuing program to eliminate unprofitable passenger services.

Although on Aug. 19, 1965, the government announced the postponement of any major new road schemes for six months, as a part of the general deferment of government expenditure, by the end of the month Britain had opened 358½ miles of a new system of highways, started construction on another 140 miles, decided on the routes of a further 237 miles, and published plans for an additional 131 miles.

On July 28 the National Ports Council recommended development projects costing between \$320 million and \$334 million at 14 major ports. A committee under the chairmanship of Lord Devlin, in the report published on August 5, made radical proposals for solving the long-standing labor problems in Britain's docks.

BOAC (British Overseas Airways Corporation) made a record profit of \$21.3 million in 1964-65, and BEA (British European Airways) showed a profit of \$3.6 million in the same period. (See also EUROPE.)

UPI

GREEK GOVERNMENT CRISIS began on July 15, 1965, when Premier George Papandreou (left) resigned after dispute with King Constantine. Elias Tsirimokos (right, in dark suit) and then Stephan Stephanopoulos (in light suit) succeeded him in office.

GREECE

A great political crisis, a church-state controversy, and the birth of a first child to King Constantine and Queen Anne-Marie dominated the year 1965 in Greece. The government once again struggled with problems arising from the rivalries, between Greek and Turkish Cypriotes on Cyprus.

Political Crisis. A dispute between 25-year-old King Constantine and 77-year-old Premier George Papandreou came to the fore in July when the premier sought to replace the minister of defense, Peter Garoufalias, and to purge the army of conservative officers whom Papandreou considered potentially disloyal to his regime.

Prior to the attempted purge, a left-wing organization named Aspida (the Shield) had been discovered in the army. Papandreou's son, Andreas, who was deputy minister of economic coordination, was rumored to be connected with Aspida, although he denied the allegation. Under these circumstances, the king blocked the premier's plan to dismiss the conservative army officers.

Papandreou announced his intention to resign as premier on July 15 when the king refused to sign a decree giving him control of the Ministry of Defense. Constantine, acting within his constitutional prerogatives, quickly replaced the premier and the ministry by naming a new government under the president of the Parliament, George Athanasiadis-Novas, a member of Papandreou's Center Union party. Athanasiadis-Novas, faced with the outbreak of obviously well-organized pro-Papandreou street demonstrations in Athens and other cities, failed to win a vote of confidence in Parliament on August 4. He was succeeded by Elias Tsirimokos, who became Greece's first Socialist premier on August 19.

He, too, failed to win a vote of confidence, however, primarily because Papandreou kept tight control over most of the Center Union deputies. Stephan Stephanopoulos, former deputy premier under Papandreou, assumed the premiership on September 18. Having formed a coalition with the National Radical Union and the Progressives, both conservative parties, he won a slim majority in Parliament on September 25.

GREECE · Information Highlights

Area: 50,547 square miles.

Population: 8,510,000 (June 30, 1964 est.).

Chief Cities (1961 census): Athens, the capital, 627,564; Salonika, 250,920; Piraeus, 183,877; Patras, 95,364.

Government: King—Constantine II (accessed to the throne on March 6, 1964); Premier—Stephanos Stephanopoulos; Parliament—300 members; party seating (1965)—Center Union (171), National Radical Union (99), United Democratic Left (22), Progressives (8).

Religious Faiths: Greek Orthodox, 97% of population; Roman Catholics, 0.5%; Protestants, 0.2%.

Education: Literacy rate (1961)—80% of population aged 15 and over. Total school enrollment (1960-61)—1,277,817 (primary, 921,205; secondary, 273,390; technical, 53,883; higher, 29,339).

Finance (1965 est.): Revenues, \$933,000,000; expenditures, \$923,000,000; public debt (1964), \$979,000,000; monetary unit, drachma (30.00 drachmas equal U.S.\$1).

Gross National Product (1964): \$5,003,000,000.

National Income (1964): \$4,123,000,000; average annual income per person, \$484.

Economic Indexes (1964): Industrial production, 154 (1958=100); agricultural production, 146 (1956-57=100), cost of living, 110 (1958=100).

Manufacturing (metric tons): Cement (1964), 2,672,000; wheat flour (1962), 1,015,000; gasoline (1963), 256,000; meat (1962), 147,000; cheese (1962), 116,000; sugar (1964), 69,000; cotton yarn (1964), 30,120.

Crops (metric tons, 1964): Wheat, 2,169,000 (ranks 18th among world producers); grapes, 1,229,000; citrus fruit, 322,000 (world rank, 13th); olives, 650,000 (world rank, 3rd); potatoes, 633,000; tomatoes, 538,000; maize, 290,000; barley, 278,000; oats, 155,000; dry onions, 143,000; tobacco, 131,500.

Minerals (metric tons, 1964): Lignite (1963), 3,804,000; bauxite, 1,300,000 (world rank, 9th); barite, 68,000 (world rank, 12th); magnesite, 200,000; pyrites, 140,000; salt, 100,000; gypsum, 95,000; pumice, 80,000; iron ore, 60,000.

Foreign Trade (1964): Exports, \$309,000,000 (chief exports: tobacco, \$119,000,000; currants, raisins, grapes, \$40,000,000); imports, \$885,000,000 (chief imports, 1963: nonelectrical machinery, \$110,400,000; ships and boats, \$68,900,000; iron and steel, \$46,100,000). Chief trading partners (1963): West Germany (took 19% of exports, supplied 18% of imports); U.S. (took 19% of exports, supplied 11% of imports); Britain (took 8% of exports, supplied 10% of imports).

Transportation: Roads (1964), 24,186 miles (6,188 paved); motor vehicles (1964), 124,693 (automobiles, 67,576); railways (1963), 1,587 miles; merchant vessels (1964), 867 (6,882,000 gross registered tons); national airline, Olympic Airways; principal airports, Athens and Salonika.

Communications: Telephones (1964): 356,378; radios (1963), 800,000; newspapers (1959), 79 (daily circulation, 1,000,000).

PICTORIAL PARADE

JILL KREMENTZ FROM NANCY PALMER

GREECE struggled through ten weeks of political strife in 1965. Deputies fought in National Assembly (left) after failure of Elias Tsirimokos' government, and Athens students demonstrated (right) for return of former Premier George Papandreou.

The pro-Communist United Democratic Left steadfastly backed Papandreou. The ex-premier called for national elections, a step to which the king would not give his approval. Meanwhile, the street demonstrations had become more antiroyalist than pro-Papandreou. They were aimed chiefly at the king and his mother, Queen Frederika. However, when King Constantine and his wife, Queen Anne-Marie, toured some of the Aegean islands in the autumn, they were greeted enthusiastically by large crowds.

Ecclesiastical Difficulties. The question of transferring bishops from poorer to richer dioceses and the selection of new bishops provoked a dispute between the Stephanopoulos government and the Greek Orthodox state church. Despite governmental opposition, 36 of Greece's 51 bishops in November elected new bishops and transferred others to vacancies among Greece's 66 dioceses. The next month the government proposed that Parliament pass legislation making extensive changes in ecclesiastical administration and finance. This was called unacceptable by the bishops and, at the year's end, the dispute remained unresolved.

Foreign Policy. Greece's foreign policies were largely centered on the Cyprus issue. The Greek-Cypriote majority on the island wished to change the provisions of the Cypriote Constitution, which gave the Turkish minority broad veto rights over legislation. The Turkish government, supporting the Cypriote Turks, continued a policy (started in 1964) of deporting Greek subjects from Turkey.

Archbishop Makarios, the Cypriote president, stressed that the union of Cypress with Greece should be the ultimate solution for the unsettled conditions on the island. On the feast day of St. Constantine (May 21), the archbishop telegraphed King Constantine, reiterating his hope that Cyprus would soon be united with Greece under Constantine's scepter. Glavkos Clerides, president of the Cypriote Parliament, sent a similar message to the king. Archbishop Makarios, however, seemed opposed to any bilateral efforts by Greece and Turkey to reach agreement on Cyprus without reference to the United Nations.

Premier Papandreou's projected visit to the Soviet Union in May was postponed after the Soviet foreign minister, Andrei Gromyko, during a visit to Turkey, spoke in support of a federated government of Greeks and Turks in Cyprus. Such a solution was totally unacceptable to the Greek government.

Royal Family. Prince Michael, cousin of King Constantine, renounced his rights to the throne and married a commoner, Marina Karella, in Febru-

ary. The king served as best man at the wedding.

Queen Anne-Marie, a Lutheran when she married King Constantine in September 1964, was received into the Greek Orthodox Church on April 21. On July 10 the queen gave birth to a daughter, who was named Alexia, in honor of the Byzantine dynasty of the Comneni and its founder, Emperor Alexius I. Princess Alexia, heiress-presumptive to the throne, was christened in Athens on September 20 with Queen Frederika as a sponsor. Attending the ceremony also were Queen Anne-Marie's parents, King Frederick IX and Queen Ingrid of Denmark.

Economy. The Papandreou government's policy of increasing subsidies for wheat farmers caused food prices to rise, producing an inflationary effect on the economy. The unsettled political conditions during the summer threatened to damage the country's important tourist industry by frightening off potential visitors. The completion in May of the first direct railroad route between Athens and Sofia, Bulgaria, was expected to increase Greek trade with Bulgaria. Greek laborers seeking employment continued to emigrate to western Europe, particularly to West Germany.

GUATEMALA

Col. Enrique Peralta Azurdia, Guatemalan chief of state and defense minister, maintained an administration untainted by corruption in 1965. Since seizing power by force on March 31, 1963, Peralta Azurdia has attempted to guarantee protection of person and property, to correct the mistakes of the previous administration, and to restore the country to constitutional government. In 1965, however, there was some public uneasiness over problems relating to the new constitution, forthcoming general elections, and Communist subversion.

New Constitution. Guatemala returned to constitutional government on September 15, when a new constitution, replacing the one suspended after the military coup of 1963, went into effect. The constituent assembly that was elected to draft the new constitution began its deliberations in March. In June it was announced that the new constitution would go into effect on Central America's independence day (September 15), that general elections would be held in March 1966, and that the new president, National Congress, and municipal governments would be inaugurated in July 1966.

In August, 14 deputies to the constituent assembly resigned in protest against the adoption of a constitutional article allowing members of the military regime to run for office in the general election. Elections to replace the resigned deputies were held August 1. More than half of the eligible voters stayed away from the polls, and over 60% of the ballots cast were blank. The election results were interpreted by some opposition leaders as popular expressions of lack of confidence in the Peralta Azurdia government.

Presidential Candidates. Three candidates for the presidency emerged after elections were set for March 1966. The only liberal, antigovernment candidate, Mario Méndez Montenegro, was shot to death on October 31—the day before he was to have opened his campaign. Méndez, a lawyer, was the nominee of the left-wing, anti-Communist Revolutionary Party.

The other two candidates were Col. Miguel Angel Ponciano Samayoa, candidate of the National Liber-

ation Movement, and Col. Juan de Dios Aguilar de León, candidate of the Institutional Democratic Party. As candidates of officially sanctioned right-wing parties, they promised a continuation of the policies of the Peralta Azurdia regime.

Col. Peralta Azurdia declared in an interview: "I will absolutely not be a candidate for the presidency."

State of Siege. Communist terrorist activities led Col. Peralta Azurdia to proclaim a state of siege which lasted from February 24 to July 28. The vice minister of national defense, Col. Ernesto Molina Arriaga, was assassinated on May 21 by six men believed to be Communists.

When it was announced in June that general elections would not be held until March 1966, the Communists responded by bombing the Costa Rican, Nicaraguan, and Brazilian embassies, the homes of the editor and the advertising manager of the anti-Communist daily *Prensa Libre*, and the oil storage tanks of the inter-American railroad. The same embassies, as well as the Honduran embassy, were bombed on June 7, ostensibly because these countries had sent troops to serve in the Inter-American Peace Force in the Dominican Republic.

By July, guerrilla bands controlled the mountainous areas of the Sierra de las Minas, and organized Communist groups harassed towns and cities. Marco Antonio Yon Sosa, a graduate of Cuba's guerrilla training camp at Minas del Frío, was nominal head of the three most militant Communist groups.

Economy. Boom conditions continued in Guatemala during 1965, although economic development did not equal the record-breaking performance of 1964. Guatemala's imports increased by 18%, to reach \$86 million in the first five months of 1965. Exports during the same period increased 5%, to a total of \$87 million. The country was troubled by a growing trade deficit and by the fact that it could not export \$40 million worth of coffee because of the terms of the International Coffee Agreement. Steadily increasing trade with other members of the Central American Common Market (CACM) helped to increase Guatemala's industrial production and gross national product.

Religious Faiths: Roman Catholics, 92% of population; others, 8%.

Education: Literacy rate (1961)—70% of population aged 10 and over. Total school enrollment (1962)—395,835 (primary, 353,084; secondary, 28,055; teacher-training, 4,158; technical, 4,631; higher, 5,907).

Finance (1965 est.): Revenues, \$166,000,000; expenditures, \$166,000,000; public debt (1964), \$99,100,000; monetary unit, quetzal (1 quetzal equals U.S.\$1).

Gross National Product (1964): \$1,310,700,000.

National Income (1963): \$1,034,000,000; average annual income per person, \$253.

Economic Indexes (1964): Industrial production, 133 (1958=100); agricultural production, 171 (1956-57=100); cost of living, 100 (1958=100).

Manufacturing (metric tons): Cement (1964), 186,000; sugar, (1964), 145,000; wheat flour (1963), 60,000; meat (1961), 40,000; beer (1963), 17,900.

Crops (metric tons, 1964-65 crop year): Coffee, 96,000 (ranks 9th among world producers); maize, 575,000; bananas (1963-64), 142,000; cottonseed, 115,000; dry beans, 41,000; cocoa beans (1962-63), 700.

Minerals (metric tons, 1963): Salt, 19,000; clays, 15,292; gypsum, 14,794; iron ore (1964), 7,100; zinc, 1,169; lead (1964), 200; silver, 64,200 troy ounces.

Foreign Trade (1964): Exports, \$158,000,000 (chief exports: coffee, \$72,300,000; cotton, \$23,200,000; bananas, \$9,400,000); imports, \$202,100,000 (chief imports, 1961: non-electrical machinery, \$16,934,000; petroleum products, \$12,841,000; motor vehicles, \$9,979,000). Chief trading partners (1963): U.S. (took 43% of exports, supplied 48% of imports); West Germany (took 17% of exports, supplied 10% of imports); Japan (took 11% of exports, supplied 5% of imports).

Transportation: Roads (1964), 7,575 miles (930 paved); motor vehicles (1964), 42,027 (automobiles, 30,262); railways (1963), 510 miles; merchant vessels (1964), 2 (4,000 gross registered tons); government airline, Aviataca; principal airport, Guatemala City.

Communications: Telephones (1964): 20,000; television stations (1964), 3; television sets (1964), 50,000; radios (1961), 210,000; newspapers (1962), 8 (daily circulation, 125,000).

In July the government announced a new code to encourage mining ventures. There was some delay in granting special benefits to new manufacturing plants and businesses, but this did not seem to discourage investment applications, which were spurred by the income tax reform of 1963. The administration also initiated fiscal reform during 1965 and continued work on housing projects and a road-building program. Businessmen applauded the Peralta administration for its prompt payment of debts.

Institutions, Claremont Men's College

GUINEA

Although Guinea's economy did not show significant improvement during 1965, the country's economic position was strengthened somewhat by promises of assistance from both the Soviet Union and the United States. The most important aid project announced in 1965 was for a Soviet-financed hydroelectric plant and aluminum smelter on the Konkouré River in central Guinea. U.S. assistance agreements formally entered into during the year included a civic action agreement, an investment guarantee to an American mining firm, and a civil aviation agreement. Guinea severed diplomatic ties with both France and Britain in 1965.

Economic Problems. Guinea continued to import rice in 1965 in response to food shortages created by a decrease in production coupled with a growing population. The shortages were brought about largely by difficulties in operating the state trading system responsible for distributing domestically produced foodstuffs.

Although Guinea's currency is nominally valued at par with the French-backed franc of the African Financial Community (CFA), it continued to be nonconvertible. The resulting foreign exchange deficit prevented the import of necessary machine parts and products, contributing to an increase in the country's unused industrial capacity.

Konkouré Dam Project. Shortly after President Sékou Touré returned from a trip to Moscow in August, the Guinean government announced that the Soviet Union had agreed to finance a huge dam, hydroelectric station, and aluminum smelter on the Konkouré River in Guinea. The proposed project, as explained by President Touré, would contribute

greatly to the exploitation of Guinea's enormous bauxite reserves and sizable iron ore deposits.

Agreements with the United States. On June 29, 1965, the United States signed a civic action agreement with Guinea. In July, Ismaël Touré, minister of economic development and a brother of the president, visited the United States to attend a meeting of the Board of Directors of the Compagnie des Bauxites de Guinée. The company is owned jointly by the government of Guinea and Halco (Mining) Inc., a wholly owned subsidiary of the Harvey Aluminum Company, which was issued a specific risk guarantee by the U.S. Agency for International Development (AID). The company contemplates a 16-20-million-dollar investment to develop bauxite reserves in the Boké region, which are believed to constitute the richest-known deposits of the mineral in the world.

A civil aviation agreement reached by Guinea and the United States consists of a technical assistance grant and a loan program to put Air Guinée, the national airline, on a sound economic basis. Technical assistance funds provided by AID will be used for training Guinean personnel in the United States and Guinea. The loans will finance the purchase of aircraft, spare parts, and a hangar installation.

Political Developments. On November 15 the government of Guinea accused two French ministers, the presidents of Ivory Coast, Niger, and Upper Volta, and former Congolese Prime Minister Moïse Tshombe of conspiring with subversive Guinean factions to overthrow the Guinean government. The government implicated a number of high-ranking Guineans in the plot and expelled the French ambassador. On November 19, President Touré shuffled his cabinet, reassigned a number of army officers, and placed under his direct control the police and the security services. France and Guinea subsequently severed diplomatic relations.

In the following month, Guinea was the first of a group of nine African nations to break diplomatic relations with Britain over Rhodesia's declaration of independence from Britain. Earlier, in October, President Touré had attended the third annual summit meeting of the Organization of African Unity (OAU) at Accra, Ghana. (See also AFRICA).

GUINEA · Information Highlights

Area: 94,925 square miles.

Population: 3,420,000 (Aug. 31, 1964, est.).

Chief Cities (1963 est.): Conakry, the capital, 78,000; Kankan, 25,000.

Government: President—Sékou Touré (took office Oct. 28, 1958). Parliament—National Assembly, 75 members (all belonging to the Guinea Democratic party).

Religious Faiths: Muslims, 61% of population; tribal religions, 37%; Roman Catholics, 1%; others, 1%.

Education: Total school enrollment (1962-63)—169,880 (primary, 159,494; secondary, 6,111; teacher-training, 1,023; technical, 3,167; higher, 85).

Finance (1965): Revenues, \$54,300,000; expenditures, \$54,300,000; monetary unit, Guinea franc (246.85 francs equal U.S.\$1).

Economic Index: Cost of living (1960), 108 (1958=100).

Crops (metric tons): Palm kernels (1963-64), 23,000 (ranks 10th among world producers); bananas (1963-64), 75,000; peanuts (1964-65), 14,500; coffee (1964-65), 9,300.

Minerals (metric tons, 1964): Bauxite, 1,679,000 (ranks 6th among world producers); iron ore, 767,000; gem diamonds, 22,000 carats (exports).

Foreign Trade (1963): Exports, \$55,100,000 (chief exports, 1962: alumina, \$26,800,000; fresh bananas, \$4,500,000; palm nuts and kernels, \$3,000,000; raw coffee, \$2,900,000); imports, \$46,100,000 (chief imports, 1962: printed cotton fabrics, \$7,200,000; rice, \$6,300,000; nonelectrical machinery, \$4,800,000). Chief trading partners (1962): France (took 18% of exports, supplied 15% of imports); USSR (took 6% of exports, supplied 20% of imports); U.S. (took 11% of exports, supplied 11% of imports).

Transportation: Roads (1964), 4,725 miles; motor vehicles (1964), 19,300 (automobiles, 7,300); railways (1964), 411 miles; merchant vessels (1964), 1 (11,000 gross registered tons); airline (1965), Air Guinée; principal airports, Conakry and Kankan.

Communications: Telephones (1964), 4,200; radios (1961), 40,000; newspapers (1962), 1.

HAITI

The Republic of Haiti, which comprises the western third of the island of Hispaniola in the West Indies, experienced no major changes during 1965 in its economy or politics. The dictatorship of President François Duvalier remained unshaken, and the economy stagnant. In foreign affairs, the government attempted to improve relations with France, Canada, the Dominican Republic, and the United States. As Haitian exile organizations were much less active than before, the number of government terrorist activities declined.

Political Developments. Although overt opposition to President Duvalier within Haiti virtually disappeared in 1965, the government remained sensitive to all forms of criticism. A Catholic prelate was placed under house arrest for urging the release of political prisoners, and the United States was presented with an official protest because of private anti-Duvalier broadcasts from New York. On the other hand, Duvalier made some reparations for Catholic properties seized in 1964. Moreover, he quietly permitted those people who sought asylum in foreign embassies to leave the country, thus reversing his previous policy.

The regime remained highly personalistic, with little systematic organization. Duvalier, who became

president for life under the new constitution of May 1964, continued to make major decisions of government, as well as minor ones. Duvalier employs persons from all walks of life to spy on his civil officials and military officers. During 1965, however, he restrained his personal secret police, the Ton-Ton-Macoute. By banning them from the country's international airport near Port-au-Prince and from the customs houses, he attempted to prevent them from interfering with tourists. Duvalier also named a special commission to investigate and recommend corrective measures for customs operations.

In February and March there were persistent rumors that Duvalier was about to proclaim himself emperor. Official sources denied the rumors, but placards hailing the president as "L'Empereur" and "François I" appeared during Mardi Gras. Nothing came of it, however.

Economic Problems. Haiti's economy limped along in 1965. In August 1964, Hurricane Cleo had inflicted some damage on coffee, the main crop. Coffee exports, however, for the fiscal and marketing year (Oct. 1, 1964 to Sept. 30, 1965) amounted to about 370,000 bags, a slight rise over the preceding year. Sugar and sisal both suffered from a decline in world prices.

The country's physical plant deteriorated further in 1965. Eyewitnesses described the capital of Port-au-Prince and the temporary terminal at the new jet airstrip there as "ramshackle." Public services operated at a low level; streets and roads were potholed, sidewalks had crumbled, and harbors were virtually empty. No social or public works were undertaken. Funds were lacking to buy essential government supplies because tax collections reportedly had declined to only 20% of the 1963 level. Tourist trade increased somewhat after the opening of the new jet airstrip near Port-au-Prince, but tourism alone was insufficient to spark an economic upturn.

Government Attempts to Ease Economic Difficulties. The government attempted to ease its economic troubles by means of international agreements, bond issues, and some curious financial deals. Early in 1965, Duvalier moved to reach an understanding with the Dominican Republic, the principal staging area for Haitian exile invasions. The Dominican uprising in April halted discussions.

Approaches to France and Canada for trade and aid produced no results. Although the United States did not reopen its Agency for International Development (AID) office in Port-au-Prince, it did continue malaria-eradication and surplus-food programs.

Duvalier tried to infuse some life into the economy by giving broad concessions to some private international operators. These projects backfired when one of the entrepreneurs absconded with large sums of government money. Other government efforts included authorizing a new bond issue in March and decreeing a forced loan in May from electric power consumers who had to purchase special government bonds in proportion to their electricity bills. The economic crisis continued, however.

HAWAII

The first session of Hawaii's 3rd state Legislature, with overwhelmingly Democratic majorities in both houses, convened on Feb. 17, 1965, in the midst of what many observers considered to be a crisis in state politics.

Political Leadership Struggle. Early in the session a bitter leadership struggle unseated Senate President Nelson Doi, who was replaced by Sen. Kazuhisa Abe, a veteran Democratic legislator from the island of Hawaii. The leadership struggle and its aftermath had profound effects on two issues facing the Legislature: (1) the enactment of a reapportionment bill that would satisfy the federal district court which had declared Hawaii's present plan unconstitutional; and (2) the questions of overhauling the tax system and granting salary increases to state employees, particularly those employed in the public schools and by the University of Hawaii.

Reapportionment. A special session of the Legislature in 1964 failed to enact a reapportionment bill. As a result, early in the 1965 regular session a federal district court directed the Legislature to call a constitutional convention to arrange for reapportionment. Fearful of the results that such a convention might produce, the Legislature sought and received from the court another chance to enact an acceptable apportionment measure. After a dramatic struggle, the legislators produced a reapportionment bill that the district court then rejected. The state appealed the court's decision

to the U.S. Supreme Court, which had not ruled on the case by the end of 1965.

Education. While reapportionment may have been the most important issue in the minds of many legislators, pressures from the public and from House Speaker Elmer Cravalho and Senate Ways and Means Chairman Nadao Yoshinaga kept the spotlight on Hawaii's educational needs. The Legislature provided substantial pay increases for teachers and repealed a requirement that teachers be Hawaii residents. More important, the state public school system received a long-overdue reorganization. Educational programs were examined and evaluated to improve both the method of teaching and the subject matter in Hawaii's schools. A study was made of the vocational education program, and a joint research program was initiated by the public schools and the University of Hawaii. By the end of the legislative session, an impressive string of bills relating to education had been approved.

Homestead Program. Political leaders Cravalho and Yoshinaga succeeded in another area—the long-dormant and grossly unsuccessful Hawaiian Homesteading Program, which has been in effect since 1920. This program had consistently failed to raise the general economic and educational level of the homesteaders. Because of this failure, the University of Hawaii conducted a study of the program. The study recommended a change of direction for the program; as a result of this recommendation, large sums of money were provided for educating the homesteaders' children, many of whom are among Hawaii's least successful students.

Appointments. Former U.S. Representative Thomas Gill became head of the Hawaii Office of Economic Opportunity; and Howard Jones, former U.S. ambassador to Indonesia, became chancellor of the East-West Center for Cultural and Technical Interchange.

HAWAII · Information Highlights

Area: 6,424 square miles.
Population: 710,000 (1965 est.).
Chief Cities (1965 est.): Honolulu, the capital (315,000); Kailua-Lanikai (33,000); Hilo (26,200); Wahiawa (18,500); Kaneohe (18,000); Aiea (16,000).
Government: Chief Officers—governor, John A. Burns (Democrat); lt. gov. and acting secy. of state, William S. Richardson (D); atty. gen., Bert T. Kobayashi (D); director of finance, Andrew T.F. Ing; supt. of pub. instr., R. Burl Yarberr; chief justice, Wilfred C. Tsukiyama; Legislature (convened Feb. 17, 1965)—Senate, 25 members (16 Democrats, 9 Republicans); House of Representatives, 51 members (39 D, 12 R).
Education: School enrollment (1964-65)—public elementary, 97,800 pupils (3,221 teachers); public secondary, 67,200 pupils (2,204 teachers); nonpublic schools, 35,200 pupils (1,170 teachers); college and university (fall 1964), 15,968 students. Public school expenditures (1964-65)—\$62,500,000 (\$422 per pupil); average teacher's salary, \$9,060.
Public Finance (fiscal year 1965): Revenues, \$366,128,412 (3.5% sales tax, \$36,898,014; motor fuel tax, \$17,057,526; federal funds, \$58,562,715). Expenditures, \$348,260,097 (education, \$99,706,866; health, welfare, and safety, \$59,413,173; roads and highways, \$23,681,687). State debt, \$300,632,951 (June 30, 1965).
Personal Income (1964): \$1,807,000,000; average annual income per person, \$2,622.
Public Assistance (fiscal year 1964): \$14,754,000 (aged, \$750,000; dependent children, \$4,988,000).
Labor Force (employed persons, fiscal 1965): Agricultural, 16,682; nonagricultural (wage and salary earners), 233,160 (10.5% manufacturing, 21% trade, 23.6% government).
Unemployed persons (fiscal 1965)—9,478.
Manufacturing (1963): Value added by manufacture, \$254,454,000 (nonelectrical machinery, \$3,320,000; food and products, \$172,766,000; printing and publishing, \$16,725,000; stone, clay, and glass products, \$12,204,000).
Agriculture (1964): Chief crops (tons)—sugarcane, 10,470,000 (ranks 1st among the states); papayas, 12,300; coffee, 6,750; taro, 4,610; bananas, 4,550; Macadamia nuts, 3,285.
Mining (1964): Production value, \$19,605,000 (ranks 46th among the states). Chief minerals (tons)—pumice, 365,000 (rank, 4th); stone, 5,282,000; sand and gravel, 407,000; lime, 9,000; clays, 3,000.
Fisheries (1964): Commercial catch, 12,684,597 pounds (\$2,847,790). Leading species—skipjack tuna, 9,023,599 pounds (\$1,221,698); striped marlin, 501,814 pounds (\$131,595); yellowfin tuna, 500,117 pounds (\$185,486); goatfish, 292,262 pounds (\$103,556).
Transportation: Motor vehicles (1965), 231,677; railroads (1963), 25 miles; aircraft (1964), 283; airports, 46.
Communications (1965): Telephones, 304,000; television stations, 17; radio stations, 24; newspapers, 7 (daily circulation, 164,861).

HEART DISEASE

In 1965 the President's Commission on Heart Disease, Cancer, and Stroke, appointed by President Lyndon B. Johnson in early 1964, proposed an elaborate plan for the care of patients with these diseases. (They currently account for 71% of all deaths in the United States.) The plan provides for a national network of centers for patient diagnosis and treatment, and for research and education in these three fields.

Experimental Surgery. At Stanford University, physicians reported that a dog lived for 11 months after his heart had been replaced by the heart of another dog. This is the longest survival period on record for transplants. The doctors attributed the length of the survival to a new method of detecting and halting the onset of the normal process ("immune response") through which the body rejects transplants. Electrocardiograms reveal the start of the rejection (the onset causes a drop in electrical output of the heart muscle), and drugs administered at that time halt the process. Investigators in

Brooklyn, N.Y., noted that puppies lived for more than 43 days after heart transplants, without immunosuppressive therapy.

Researchers at the Metropolitan Hospital in Cleveland, Ohio, experimented with an artificial pacemaker which features a pressure-sensitive crystal and draws its energy directly from the beating action of the heart. This thumb-sized miniature device can be attached inside the chest wall, so that the crystal is slightly bent when the heart contracts. The crystal converts the heart motion into electrical signals that power a generator. This, in turn, sends an electrical pulse into the heart muscle, causing the heart to beat.

To increase the contractile force of a damaged heart, "paired" pacing of the heart was tried. With this method an impulse can be timed to stimulate the heart during the period following a beat, while the muscle is still refractory to stimulation. The impulse delays the next beat, thus slowing the rate and making each heartbeat more effective.

Hypertension. The year 1965 brought forth a new concept in the treatment of hypertension (high blood pressure): electronic stimulation of the carotid sinuses. In an experiment using dogs with induced high blood pressure, intermittent stimulation of the carotid sinuses by an implantable unit effectively lowered and maintained the blood pressure for a long period.

Dr. Jerome W. Conn of the University of Michigan, and his coworkers, theorized that 20% of patients with essential hypertension have a small aldosterone-secreting tumor of the adrenal cortex. Testing of this hypothesis will depend on developing simpler methods to detect hyperaldosteronism.

Coronary Disease. In the intensive coronary care units in many hospitals during 1965, patients suffering from attacks due to occlusion of coronary arteries were monitored continuously by electronic devices. These recorded instantly any abnormalities of the heart beat, alerting doctors to the fact that patients required attention. Immediate treatment of such disorders helped save the lives of the patients.

Dr. Paul A. Owren of University Hospital, Oslo, Norway, reported that a tendency to thrombosis and coronary heart disease in certain population groups may be related to a dietary deficiency of linolenic acid. A good source of the acid is linseed oil. According to Dr. Owren, a daily tablespoon of oil (refined for human consumption) reduced platelet adhesiveness within three days. Such treatment may help prevent thrombosis.

Human Investigative Studies. Doctors at the New Jersey College of Medicine in Jersey City (N.J.) found that alcoholics who consume 6 to 7 two-ounce drinks of whiskey within two hours suffer a 25% drop in the contraction force of their hearts. British physicians reported heart failure and death in chronic alcoholic cases. Such studies reveal that alcoholism may endanger the heart.

The National Naval Medical Center at Bethesda, Md., developed an ultrasonic cardioscope capable of monitoring the heartbeat of human embryos as early as ten weeks after conception. This device emits a sound beam 300 times above the audible range that travels through the mother's abdominal wall and amniotic fluid. A beam striking the fetal heart relays an echo to a hand-held transmitter. Then electronic equipment converts the echo into audible frequencies on tape. The taped message informs the doctor whether the baby has congenital heart ailment (endocardial fibroelastosis).

New Drugs. Two diuretic agents, Ethacrynic acid and Furesomid, as yet not commercially available in the United States, were reported to be effective in edema due to heart failure.

Since potassium salts in coated tablets may induce ulcers, obstruction, or perforation of the small intestine, it was suggested that the drug be given in liquid form, if potassium therapy is indicated.

HIGHWAYS

Expenditures of federal, state, and local government for highways, streets, and roads in the United States reached a new high of an estimated \$14.2 billion in 1965. This total was distributed as follows: maintenance, \$3.20 billion; capital outlay, \$8.54 billion, including \$6.67 billion for new construction and for improvement of existing roads and streets, \$722 million for preliminary engineering and planning, and \$1.15 billion for right-of-way purchase; and administration, policing and safety, and debt, \$2.41 billion. The capital outlay involved expenditure of \$7.08 billion on state-administered principal highways, secondary roads, and arterial streets, and of \$1.46 billion on local roads and streets.

Major sources of revenue for highways in 1965 were: federal road-user taxes, \$3.70 billion; state road-user taxes, \$6.57 billion; local government property taxes and general fund appropriations, \$1.82 billion; and proceeds of state and local bond issues, \$1.31 billion.

In 1965 the United States had a total of 3,620,000 miles of roads and streets. Motor-vehicle registrations in 1965 were expected to reach 90 million, 4.6% above the preceding year. Total highway travel in 1965 was estimated at 870 billion vehicle-miles, a gain of 3.6% over 1963.

Federal-aid Programs. Federal aid to the states for highway improvement is administered by the Bureau of Public Roads, U.S. Department of Commerce. The aid program began modestly in 1916, grew gradually during the ensuing years, and was greatly expanded in 1956. The program is cooperative, the states doing the actual work and retaining responsibility for the roads and their maintenance. Funds for the federal-aid highway program are disbursed from a special highway trust fund in the U.S. Treasury. The money for this fund comes wholly from earmarked federal highway-user taxes, the principal one being the motor-fuel tax. Net tax revenue of the trust fund in the fiscal year 1965 was \$3.66 billion.

A major objective of the federal-aid program is the completion by 1972 of the National System of Interstate and Defense Highways. This 41,000-mile network of controlled-access superhighways will serve practically every city of 50,000 population or more, and many smaller towns. It is designed to handle adequately the traffic anticipated 20 years beyond the design period. By 1975 some 116 million motor vehicles will be traveling more than a trillion miles a year in the United States, and the Interstate System will carry 20% of this total. It is expected that the safety features of the completed system will save upwards of 8,000 lives a year.

SAFETY AND BEAUTY are major aims of engineers who design highways. Unobstructed vision and uncluttered roadsides are the results of good planning. The view of the Catskills from the Thomas E. Dewey Thruway in New York State contrasts with the jumble of signs found along many American roads.

NEW YORK STATE THRUWAY AUTHORITY

Federal funds are being used to pay for 90% of the cost of the Interstate System. A new estimate of the cost of building the Interstate System, made in January, set the total cost at \$46.8 billion, an increase of \$5.8 billion over estimates made in 1958 and 1961. The increased cost results largely from improved service, safety, and durability features, and rising unit costs.

In the older, continuing so-called "ABC" federal-aid program for the improvement of primary highways, secondary roads, and arterial streets, federal funds are matched by the states. The networks eligible for federal aid total 901,120 miles, of which 267,774 miles are in the federal-aid primary system of main rural roads and major streets (including the Interstate System mileage), and 633,346 miles are in the federal-aid secondary system of farm-to-market and feeder roads. Urban portions of these systems total 47,451 miles.

Federal-aid funds authorized by Congress are apportioned among the states according to methods prescribed by law. This is done well in advance so that the states can plan how to use aid funds. The table on page 334 shows the apportionment of funds

for the fiscal year 1967. The \$4 billion total includes \$3 billion for the Interstate System and \$1 billion for the regular ABC federal-aid program.

Miles of Highway Completed. By June 30, 1965, some 19,396 miles of the Interstate System were open to traffic. This included 14,220 miles completed to the ultimate standards for future traffic needs, and 2,851 miles improved at least to capability for handling current traffic but needing further work to reach ultimate standards. Some 2,325 miles of toll roads, bridges, and tunnels are included in the system, as permitted by law, but no federal aid is spent on such facilities.

During the fiscal year 1965, 2,433 miles of the Interstate System were opened to traffic. Work completed on the system during the year cost \$2.71 billion, of which \$2.41 billion was federal aid. Construction was under way at the end of the fiscal year on 6,135 miles, and preliminary planning and right-of-way acquisition were in progress on another 11,820 miles, at a cost of \$9.8 billion.

In the ABC federal-aid program, improvement projects were completed during the fiscal year on 14,702 miles of roads and streets at a cost of \$1.86

WIDE WORLD

BILLBOARDS crowd each other and obscure the view on a freeway near Los Angeles, California. Legislation enacted by Congress in 1965 will restrict billboards and junkyards along roads that are built with federal assistance.

billion, of which \$977 million was federal aid. At the end of the year, work was under way on 20,962 miles at an estimated cost of \$4 billion.

Safety and Beautification. Strong interest developed during 1964 and 1965 in highway safety and beautification. As part of the federal-aid program, an intensive effort was made to eliminate known hazards from the highways. Greater emphasis was placed on highway beautification, both in road location and design and in roadside landscaping. President Johnson recommended and Congress enacted legislation relating to billboard and junkyard control and scenic road development on the federal-aid highway systems. (See CONSERVATION.)

In addition to administering the federal aid program, the Bureau of Public Roads builds roads in national parks and forests and on other public lands, and administers disaster-repair and defense-access road programs. During the fiscal year 1965, projects were completed on 2,115 miles of such roads at a cost of \$108 million in federal funds.

Assistance to Other Countries. Since 1930, the United States, through the Bureau of Public Roads, has aided the six Central American republics in building the 3,142-mile Inter-American Highway from Laredo, Texas, to Panama City, Panama. The Bureau continued to support improvement of the road at a number of locations in 1965. It also initiated a survey for a route through the Darien Gap jungle of Panama and Colombia.

Since World War II, the Bureau of Public Roads has assisted many countries to establish highway departments and highway programs. Such work is financed by the U.S. Agency for International Development (AID) or by loans from the Export-Import Bank of Washington or the World Bank. In 1965 the bureau had missions in 20 countries.

HONDURAS

The impressive 1964 record of economic development in Honduras continued in 1965 as the government relaxed controls over business, and the Central American Common Market (CACM) stimulated private initiative and enterprise. The political situation was stabilized under constitutional government, and free elections were held.

Economy. President Oswaldo López Arellano announced that the gross national product (GNP) totaled \$468 million in 1964, exceeding that of 1963—also a favorable year—by 6.5%. The 3.5% per-capita increase was by far the largest gain attained in recent years. President López Arellano forecast a 5% increase in GNP in 1965.

Banana exports for January 1965 were 135% higher than in January 1964. The increase was due mainly to the expansion program of the United Fruit Company and associated producers. Cotton production rose by 59% over the 1964 output. Coffee shipments dropped 17%, however, because of poor weather and depressed prices. Beef production was good, and 2.9 million pounds of chilled beef were exported to the United States in the first quarter of 1965—a 50% increase over the same period in 1964. The increase in exports was due largely to new slaughtering and packing plants and the renovation of old facilities.

Highway construction is given high priority every year in the Honduran budget. Loans totaling \$19.6 million, mostly from three international financial agencies, were approved in 1965 for the \$25 million Northern Highway project, which is scheduled for completion by 1970. The new highway will cut the transportation time between Tegucigalpa and San Pedro Sula almost in half.

The United States provided technical assistance of \$1.9 million on a grant basis in the fiscal year

1965, with \$2 million more planned for 1966. In October the Agency for International Development authorized a loan of \$5.2 million to assist in the construction of 374 miles of rural farm-to-market access roads.

Elections. Elections were held on February 16 to select 64 members of a constituent assembly that will draft a new constitution and name a president. The Nationalist party, led by Air Force Col. Oswaldo López Arellano, won 35 seats, as against 29 seats for the Liberal party, led by former President Ramón Villeda Morales. Although both parties agreed that the elections were conducted without fraud in the two largest cities, Tegucigalpa and San Pedro Sula, the Liberal Party charged election irregularities in rural areas of the country.

The assembly convened on March 15 and elected Col. López Arellano as president for a six-year term. López Arellano attempted to conciliate the defeated Liberals by offering them positions in the government. The Liberals, however, remained disaffected, and attempted unsuccessfully to stage a general strike in July.

Actions of the New Government. The government embarked on an ambitious 4-year development plan in which both foreign and domestic private enterprise will play a role. It announced that foreign and domestic capital investment would be effectively protected, and that private industry would be offered incentives by the government.

Guerrillas and terrorists were smuggled into Honduras in 1965, mainly by the Central American guerrilla command in Guatemala, but the counter-

insurgency and civic action programs of the Honduran armed forces adequately coped with the threat.

Early in the year, Honduras contributed a contingent of 250 troops to the Inter-American Peace Force which was sent to the Dominican Republic by the Organization of American States to help maintain a cease-fire in that country.

Although President López Arellano surrounded himself with able men and governed without repression, the Freedom of the Press Committee of the Inter-American Press Association declared in October that freedom of the press was lacking in Honduras.

HONDURAS, British. See BRITISH HONDURAS.

HONG KONG

Hong Kong, British crown colony and international entrepôt, enjoyed a year of flourishing business in 1965. Imports from Communist China, Hong Kong's major supplier, and exports to the United States, its biggest buyer, reached record levels. A brief run on Chinese-controlled banks in February caused no major financial crisis.

Trade and Industry. Hong Kong's imports from China, which reached a record \$500 million in 1964, were expected to total \$625 million by the end of 1965. About 30% of these imports were resold to other nations.

The colony's other chief trading partner, the United States, increased its imports from Hong Kong by 27% in 1964. Clothing was the largest single item in the \$217 million total.

Both the United States and China increased investments in Hong Kong's trade and industry in 1965. A new electric power plant was being constructed in the colony as a joint venture of Esso Standard Eastern, Inc., and the China Light and Power Company, Ltd. The plant, to cost \$90 million, will supply 720,000 kilowatts of electricity.

HONG KONG · Information Highlights

Area: 43,277 square miles.
Population: 2,163,000 (June 30, 1965, est.).
Chief Cities (1961 census): Tegucigalpa, the capital, 134,075; San Pedro Sula, 58,632; La Ceiba, 24,863; Puerto Cortés, 17,048.
Government: President—Col. Oswaldo López Arellano (assumed power after coup d'état, Oct. 3, 1963; elected president by National Assembly, March 23, 1965). *Constituent Assembly*—64 members; partly seating (1965)—National Party, 35; Liberal Party, 29.
Religious Faiths: Roman Catholics, 97% of population; others, 3%.
Education: Literacy rate (1961)—45% of population aged 15 and over. Total school enrollment (1963)—279,649 (primary, 259,112; secondary, 14,686; teacher-training, 1,864; technical, 1,912; higher, 2,075).
Finance (1964): Revenues, \$56,100,000; expenditures, \$56,100,000; monetary unit, lempira (2 lempiras equal U.S.\$1).
Gross National Product (1964): \$468,000,000.
National Income (1964): \$402,000,000; average annual income per person, \$192.
Economic Indexes (1964): *Agricultural production*, 135 (1956=100); *cost of living*, 110 (1958=100).
Manufacturing (metric tons): Cement (1964), 73,000; sugar (1964), 34,000; meat (1963), 19,000; wheat flour (1963), 15,000; cheese (1962), 11,000; beer (1963), 151,000 hectoliters; lumber (1962), 474,000 cubic meters.
Crops (metric tons, 1963–64 crop year): Bananas, 885,000; maize, 302,000; sorghum, 59,000; dry beans, 44,000; coffee (1964–65), 25,200; cottonseed (1964–65), 19,000; cassava, 16,000.
Minerals (metric tons, 1964): Silver, 3,220,371 troy ounces (ranks 12th among world producers); salt, 10,000; zinc, 6,993; lead, 454; cadmium, 34; gold, 3,319 troy ounces (U.S. imports).
Foreign Trade (1964): *Exports*, \$94,750,000 (chief exports: bananas, \$34,200,000; coffee, \$16,700,000; silver, \$3,050,000); *imports*, \$101,900,000 (chief imports, 1963: nonelectrical machinery, \$10,920,000; electrical machinery, \$7,149,000; petroleum products, \$6,998,000). *Chief trading partners* (1963): U.S. (took 60% of exports, supplied 48% of imports); El Salvador (took 11% of exports, supplied 8% of imports); West Germany (took 10% of exports, supplied 5% of imports).
Transportation: Roads (1964), 2,175 miles (237 paved); motor vehicles (1964), 15,500 (automobiles, 8,000); railways (1963), 716 miles; merchant vessels (1964), 16 (63,000 gross registered tons; principal airports, San Pedro Sula, Tegucigalpa).
Communications: Telephones (1964), 9,266; television stations (1964), 3; television sets (1964), 6,500; radios (1961), 125,000; newspapers (1963), 6.

Area: 1,126 square miles (land only, 398 square miles).
Population: 3,804,000 (July 1, 1965 est.).
Chief City (1961 census): Victoria, the capital, 633,138.
Government: Sovereign—Queen Elizabeth II; Governor—Sir David Trench. *Executive Council*, 12 members; *Legislative Council*, 17 members.
Education: Literacy rate (1961)—71% of population aged 15 and over. Total school enrollment (1962)—699,498 (primary, 556,628; secondary, 125,459; technical, 8,306; higher, 9,105).
Finance (1964–65 est.): Revenues, \$240,000,000; expenditures, \$259,000,000; monetary unit, Hong Kong dollar (\$7.7 dollars equal U.S.\$1 at the official rate).
Economic Index: Cost of living 1964, 109 (1958=100).
Manufacturing (metric tons): Cement (1964), 215,000; cotton yarn (1964), 118,320; beer (1963), 17,790; coke and breeze, 12,700; wool yarn (1963), 5,100.
Chief Crops: Rice, fruits, vegetables.
Minerals (metric tons, 1964): Iron ore, 116,000; kaolin, 5,124; feldspar, 1,581; graphite, 721.
Foreign Trade (1964): *Exports*, \$1,012,000,000 (chief exports, 1963: clothing, \$242,000,000; cotton fabrics, \$83,000,000; toys and games, \$37,000,000; electrical machinery and appliances, \$30,000,000); *imports*, \$1,496,000,000 (chief imports, 1963: machinery, \$119,000,000; raw cotton, \$69,000,000; rice, \$55,000,000). *Chief trading partners* (1963): U.S. (took 20% of exports, supplied 11% of imports); Britain (took 18% of exports, supplied 12% of imports); Japan (took 6% of exports, supplied 17% of imports); Communist China (took 1% of exports, supplied 20% of imports).
Transportation: Roads (1964), 543 miles (paved); motor vehicles (1964), 69,593 (automobiles, 33,156); railways (1963), 22 miles; principal airport, Kai Tak, on Kowloon Bay.
Communications: Telephones (1964): 178,285; television stations (1964), 1; television sets (1964), 35,000; radios (1962), 189,000; newspapers (1962), 44 (daily circulation, 772,000).

More than 370,000 tourists visited the colony in 1964. They spent an estimated \$130 million.

The colony's labor force, which numbers about 350,000, enjoyed virtually full employment in 1965. There was a slight shortage of workers between 18 and 25 years old, who are preferred by many of Hong Kong's industries.

Bank Run. A brief but heavy run on Chinese-controlled banks in Hong Kong took place in early February. The run began when several clients of the Chinese-controlled Ming Tak bank reported that U.S. dollar checks issued by the bank had not been honored in the United States. In the following days, many depositors withdrew their money from the 14 Chinese banks in Hong Kong. To ease the shortage of local currency caused by the bank run, the government of Hong Kong requested a supply of sterling bank notes from the Bank of England. Sir David Trench, governor of the colony, went on the air on February 9 to urge that money withdrawn be returned. The banking situation returned to normal by the end of the year.

Red Chinese Refugees. The influx of refugees from China, which had fallen to insignificant numbers in 1964, rose in the spring of 1965. The number of refugees entering Hong Kong in May was estimated to be 1,000. The chief reason the refugees fled China was reported to be their fear of being drafted into military service.

Relations With Peking. The mutual benefits of flourishing business in Hong Kong continued to maintain friendly relations between China's Communist government in Peking and the British government in Hong Kong. Soviet jibes at Peking's tolerance of the British colony on its coast have been ignored in China. One important reason for this is that China's trade and investment in Hong Kong account for about 60% of its foreign exchange earnings from business with the non-Communist world. The colony buys 20 times as much from China (including its daily water and food), as it sells there.

HORTICULTURE. See GARDENING AND HORTICULTURE.

HOSPITALS

There were 7,127 hospitals of all types in the United States in 1964—a decrease of 0.2% from 1963. There were also fewer hospital beds available in 1964—1,696,039, representing a decrease of 0.3% from 1963. The number of patients admitted to hospitals during 1964 rose to 28,266,239, up 2.8% from the 1963 figure. From 1963 to 1964 the average daily hospital census declined by 0.6%, to 1,420,918. The result was a decline in the average occupancy for all hospitals, from 84% in 1963 to 83.8% in 1964.

The average cost for a day's care in voluntary, short-term hospitals during 1964 was a record \$41.58, or almost twice the figure for 1954. This sharp increase was due to the devaluation of the dollar, advances in medicine and technology, demands for more and highly trained technicians, and increased wages of hospital personnel.

Health Care for the Aged. In July 1965 the Social Security Act was amended by Congress to provide health insurance coverage under Medicare for all persons over 65. The hospital portion of the program will pay part of the charges for room, drugs, supplies, and other services customarily included in

hospitalization. The program was estimated to cover more than 16 million persons at a cost to the federal government of \$2.5 billion for the first year. An optional medical plan to pay most of a patient's doctor bills while in the hospital requires small monthly contributions by the subscribers. (See MEDICARE; SOCIAL SECURITY.)

Data Processing. Currently, 7% of all hospitals have some form of automatic or electronic data-processing system. The smaller hospitals have utilized business-office computer applications, while the larger institutions also have engaged in clinical and research applications.

Utilization and Control. Hospital medical staff utilization committees have been developed extensively to maintain the lowest cost for inpatient hospital care consistent with a high quality of medical care. The success of this form of medical audit indicates that similar action should be taken in the areas of medical science.

Regional Planning. The McCloskey law, the first law to enforce regional planning and control of hospital construction, was passed by the State of New York. Such planning provides for the development of hospitals by need, the avoidance of duplicating facilities, the conservation of available health funds, and the better utilization of existing facilities.

Disaster Hospitals. The U.S. Department of Health, Education, and Welfare announced in December that it had shipped its first emergency "canned hospitals"—eight to Puerto Rico and two to Hawaii. These 200-bed hospitals contain sufficient supplies and equipment to operate for 30 days without resupply. The hospitals are designed to be set up in times of emergency to replace local facilities that have been destroyed or to expand existing facilities. They can be set up in less than 12 hours.

Program in Hospital Administration
University of Minnesota

HOTELS AND MOTELS

Hotel room occupancy in the United States in the first nine months of 1965 averaged 62%, as compared with 61% for the same period in 1964. The increase marked the second consecutive year in which occupancy had registered a slight gain. However, the hotel industry's gain lagged far behind that of the general economy in 1965. Industry sources attributed the slight advance in hotel occupancy partly to the record number of American travelers, the tourist attractions at the New York World's Fair, and the rise in the number of overseas travelers visiting the United States. Occupancy of New York City hotels and motels for the first nine months of the year rose from 65.7% in 1963, before the fair opened, to 74.9% in 1964 and then dipped slightly, to 73.7% in 1965.

New Hotels. Major new hotels completed in the United States in 1965 were the 1,200-room Washington Hilton, Washington, D.C.; the \$23.5 million, 1,012-room Sheraton-Boston, Boston, Mass.; the \$12 million, 154-room Mauna Kea Beach Hotel, Hawaii; the \$12 million, 423-room Pontchartrain Hotel, Detroit, Mich.; and the \$10 million, 275-room Del Webb's Towne House (a combination office building and hotel), Phoenix, Ariz.

New hotels opening outside the United States in 1965 included the 1,200-room Otani, Tokyo; the 428-room Tel Aviv Hilton, Tel Aviv; the 245-room Tunis Hilton, Tunis; the 274-room Orly Hilton, Paris; the 344-room Oberoi Intercontinental, New Delhi; the 300-room Hannover Intercontinental, Hannover, West Germany; and the 101-room Hotel Pago Intercontinental, American Samoa.

New Motels. Among the larger motor hotels completed in the United States in 1965 were the \$5 million, 355-room Holiday Inn at Los Angeles International Airport; the \$3 million, 150-room Portofino Inn, Redondo Beach, Calif.; the \$3 million 232-room Houstonaire Motor Inn, Houston, Texas; the 170-room \$2 million Holiday Inn, Phoenix, Ariz.; the \$2 million 200-room Ramada Inn, Topeka, Kan.; the \$2 million, 119-room Howard Johnson's Motor Lodge, Denver, Colo.; and the \$2 million, 102-room Congress Inn, Baltimore, Md.

Lodging Statistics. The 1963 Census of Business (published in 1965) lists a total of 64,276 hotels and motels and motor hotels in the United States, with 2,447,200 rooms. Their receipts totaled \$4.6

DEL WEBB'S TOWNE HOUSE

DEL WEBB'S TOWNE HOUSE, a new hotel and office building combination in Phoenix, Ariz., was opened in 1965. The 275-room structure was built at a cost of \$10 million.

billion, up from \$3.6 billion reported in the 1958 census. Since the 1958 census, the number of hotels declined from 29,203 to 22,692, while the number of motels increased from 41,332 to 41,584. According to the census, the number of establishments and guest rooms in the nation's lodging industry has increased by about 55% since 1939, with the advances due entirely to motel construction.

In 1965 the American Hotel & Motel Association's *Directory of Hotel and Motel Systems* listed 172 lodging chains, with a total of 3,543 hotels and motels—an increase of 802 over 1964.

American Hotel & Motel Association

MAUNA KEA BEACH HOTEL

MAUNA KEA BEACH HOTEL, located on the northwest coast of the island of Hawaii, opened in July 1965. The stepped-back tier construction used in building the \$12 million hotel provides the 154 guest rooms with open lanais, or lounging terraces.

HOUSING

Private housing construction in the United States continued at a relatively high level in 1964 and the first half of 1965. However, there was a slight downward trend, and total starts in 1965 probably were somewhat lower than in 1964. Mortgage foreclosures remained relatively high, but the sharp upward movement of recent years appeared to have leveled off. A number of localities experienced overbuilding and market softness. Mortgage funds continued plentiful, but interest rates increased slightly late in the year.

Two housing laws of far-reaching importance were passed by Congress during 1965. The Housing and Urban Development Act of 1965 represented the most comprehensive and significant extension of federal programs to assist housing and urban renewal since the landmark Housing Act of 1949. In September, Congress created a new cabinet-level Department of Housing and Urban Development to administer the provisions of these acts and the related federal programs previously under the jurisdiction of the Housing and Home Finance Agency (HHFA).

The Housing and Urban Development Act. This act, signed by President Johnson on August 10, extended the major programs of the HHFA for four years. It also provided for the creation of a number of new authorities to administer programs aimed at housing and urban improvement.

The act's most discussed feature was a new program of federal rent-supplement payments to help provide better living conditions for low-income families. Under the rent-supplement provisions, housing financed by the Federal Housing Administration (FHA) and built or rehabilitated by nonprofit, limited-dividend, and cooperative organizations for the use of low-income families will be eligible for federal rent-supplement payments. These payments are to cover the difference between the rent required for living units and an amount equal to 25% of the income of eligible low-income tenants. To be eligible for rent-supplement payments, persons must have incomes within the ceilings established by the low-rent public housing law, and either be elderly, physically handicapped, displaced by governmental action, or living in substandard housing units, or else be occupants of a dwelling damaged or destroyed by a natural disaster. Getting the program

under way was delayed, however, when Congress failed to provide contract funds before adjourning in October.

The new act continued the FHA's special below-market-interest-rate mortgage insurance program for low- and moderate-income families until Oct. 1, 1969, and reduced to 3% the interest rate for mortgages insured under this program. The FHA was also authorized to insure mortgages that finance the cost of land development for residential and related uses. Such mortgages cannot exceed \$10 million.

Another provision of the act was the authorization of federal subsidies for approximately 240,000 additional units of low-rent public housing over the next four years. The act encouraged the use of the private housing supply for low-rent public housing by authorizing the purchase, rehabilitation, or leasing of existing private housing for this purpose. The authorization for federal direct housing loans for the elderly and handicapped was increased from \$350 million to \$500 million, with the interest rate reduced from 4% to 3%.

The act increased the authority for federal grants for urban renewal programs by \$2.9 billion over a four-year period. Federal grants also were authorized for assisting cities and counties to carry out programs of code enforcement in deteriorated or deteriorating areas. Another provision was the authorizing of grants up to \$1,500 each for low-income homeowners in urban renewal and code-enforcement areas to cover repairs for their homes.

The act authorized federal grants to local public bodies to help construct basic public water and sewer facilities. It provided assistance to build neighborhood and community centers, youth centers, health stations, and other facilities. It permitted acquisition and development of land for open-space uses, both in outlying areas and in built-up portions of urban areas. The act also made federal funds available for urban beautification and improvement, and for the acquisition of sites to be used to construct public works or facilities.

Department of Housing and Urban Development. This department is designed to help administer and coordinate federal programs for providing housing, for the development of communities, and for solving problems that arise in connection with urban, community, suburban, and metropolitan development. It will collaborate with state, county, town, and other

HUGE APARTMENT HOUSES are characteristic of urban development. Those shown at left are part of New Haven's extensive redevelopment program, and now occupy what used to be one of the city's worst slum areas.

local and private agencies. The new department absorbs all the functions and programs previously assigned to the HHFA. The Federal National Mortgage Association was transferred to the new department as a corporate entity.

Federal Financing. Federally assisted urban renewal activity continued at a high level in 1965. Federal funds for this purpose amounted to \$607.4 million in 1964, and \$166 million for the first quarter of 1965. At the end of the latter period, total grants made since the beginning of the program in 1949 amounted to about \$4.5 billion, and 1,764 urban-renewal projects and related programs had received federal financial support. Federally assisted low-rent public housing units completed, under construction, or planned, increased from 682,307 at the end of 1963 to 715,188 in April 1965.

In 1964 and the first quarter of 1965 the FHA received applications under its program for profit and nonprofit housing projects for the elderly that would provide over 5,000 living units. The HHFA's program of direct loans to nonprofit corporations for such housing received applications for 6,134 units in 1964, and for 1,090 in the first quarter of 1965. At the end of the first quarter of 1965, nearly 100,000 public housing units for the elderly had been put under program reservations, and 11,271 units were completed in 1964 and the first quarter of 1965.

Volume of Residential Construction. By June 1965 the seasonally adjusted annual rate of new private residential construction was \$26.8 billion, compared with \$26.5 billion in 1964. The estimated number of new permanent, nonfarm, private housing units started in the United States was 1,530,400 in 1964, or slightly below the 1,581,700 units in 1963. In the early part of 1965, housing starts continued at a somewhat reduced level—283,000 for the first quarter of 1965, as against 326,300 for the same period in 1964. This decline was attributable to a reduction in apartment construction. Preliminary data for the first seven months of 1965 showed that multifamily activity had declined by 12%, and that virtually no change had occurred in single-family home-building activity.

Of the privately owned nonfarm housing units started in the first quarter of 1965, 81.5% were financed through conventional loans without direct government assistance, 14.5% through FHA-insured loans, and 4.1% through loans guaranteed by the Veterans Administration. Comparable figures for all of 1964 were 82.8%, 13.4%, and 3.9%, respectively.

Construction Costs. The cost of the average nonfarm single-family dwelling unit has climbed steadily. In 1959 the average was \$13,425, but by 1964 it had risen to \$15,575, and early in 1965 it went well above \$16,000. Both the E.H. Boeckh residential cost index and the Department of Commerce index of general construction costs continued to climb. In 1963 the Boeckh index (1957-59=100) was 108.5; in December 1964 it was 111.6, and by March 1965 it was 113.5. However, the rate of increase in residential construction costs has been considerably less in recent years than it was between the end of World War II and 1957. The higher cost is due in part to the fact that houses are larger and better constructed.

Market Conditions. Funds available for mortgage financing remained plentiful during the latter part of 1964 and the first six months of 1965, as they have been since 1962. Interest rates on mortgage loans remained remarkably stable during the same period,

as did the prices at which lenders were willing to purchase fixed-interest FHA-insured and VA-guaranteed loans. FHA reports show that the average conventional mortgage interest rate for new homes continued steady at 5.8%. Prices paid for FHA-insured 5.25% mortgages, with 25-year terms and 10% down payments, remained steady at \$98.5 per \$100 of loan throughout 1964; from January through August 1965 the comparable price was \$98.6. However, during the latter part of 1965 the money market became somewhat tighter. This led to a slight pressure upward on mortgage interest rates.

Vacancy rates in homes and apartments in the United States have risen steadily in recent years. The Bureau of the Census estimated the average vacancy rate at 7.7% for the first quarter of 1965. This rate was considerably higher than the 5.6% rate for the first quarter of 1956, but not so high as the 8.0% rate for the first quarter of 1961. The bureau's vacancy rates for sales housing are much lower. The figure for the first quarter of 1965 was 1.5%, as compared with 1.3% for the same period in 1964. However, the comparable figure for the first quarter of 1957 was 0.8%.

In recent years mortgage foreclosures have risen more sharply than vacancies. Based on Federal Home Loan Bank Board figures, the rate of foreclosures per 1,000 mortgaged homes was 1.96 in 1957. In 1960 there were 2.65 foreclosures per 1,000 mortgaged homes, and by 1962 the figure had risen to 4.12. However, figures available for 1964 and the early part of 1965 indicated that the rate of foreclosures has leveled off. The board reported the number of nonfarm foreclosures in 1964 as 108,620, averaging between 26,000 and 28,000 per quarter during that year. For the first quarter of 1965 the same report showed 27,859 foreclosures.

M. CARTER MCFARLAND
Assistant Commissioner for Programs
Federal Housing Administration

HOUSTON

Houston, the seventh largest city in the United States and the largest city in Texas (1965 est.: city, 1,100,000; metropolitan area, 1,470,000), opened the Harris County Domed Stadium and held municipal elections in 1965. The \$35 million, air-conditioned stadium became the home of the Houston Astros professional baseball team and the University of Houston football team. In the municipal elections in late December, voters approved the creation of the Harris County Hospital District and reelected incumbent Mayor Louis Welch and all incumbent councilmen to two-year terms.

New Stadium. An exhibition game between the Houston Astros and the New York Yankees opened the so-called Houston Astrodome on April 9. President Lyndon Johnson was among the almost 50,000 spectators. Glaring light coming through the translucent plastic dome troubled players at the first daytime games, but the problem was later corrected by painting the plastic dome.

Municipal Elections. Considerable excitement in elections in December was generated by the question of financing the Ben Taub and Jeff Davis public hospitals through the creation of the Harris County Hospital District. The proposal for the new district, which had been rejected at four past elections and was a subject of considerable dispute between the city and the county, finally won the voters' approval in 1965.

Reapportionment. The state legislative and federal congressional districts were reapportioned in 1965, giving the Houston-Harris County area increased representation in the state and federal governments. The area was assigned a third congressional seat, three new state senators, and a total of 19 state representatives. (See also TEXAS.)

School Integration. A plan to speed up desegregation of public schools was announced by the Houston Independent School District, with full integration scheduled for the fall of 1967. Rice University admitted its first Negro student in 1965.

Newspaper Sale. The *Houston Chronicle*, the city's evening newspaper, was sold in December by Houston Endowment Incorporated to multimillionaire oilman John Mecom. Included in the \$85 million sale was the Rice Hotel and other downtown properties.

Construction. The \$150 million Manned Spacecraft Center of the National Aeronautics and Space Administration, situated southeast of Houston, neared completion in 1965. Two high-rise apartment buildings were opened in the downtown area, and several condominium apartment projects were completed in the west and southwest residential areas. Ground was broken for four new buildings at the University of Houston, which enrolled a record 19,500 students in the fall of 1965.

Finances and Economy. The city's budget for 1965 was \$68,472,792, and the bonded debt stood at \$290,613,000. There were indications at the end of the year that a referendum might be necessary early in 1966 for an additional \$76 million bond issue. Houston's tax rate in 1965 remained at \$2 per \$100 of assessed valuation.

Unemployment in the Houston area in 1965 averaged 3.2% of the estimated labor force of 620,000.

HULL, Bobby. See biographical sketch under SPORTS.

HUMPHREY, Hubert Horatio

Vice president of the United States: b. Wallace, S.Dak., May 27, 1911.

Ability, energy, and ambition carried the son of a South Dakota pharmacist to the second-highest office in the country in 1965. On January 20, Hubert Humphrey, a Democrat and a former senator from Minnesota, was sworn in as vice president, and presented the apparent anomaly of a dynamic man entering upon an office notorious for its lack of respon-

sibilities and power. But Humphrey, like several recent vice presidents, found ways to serve his president, and he worked vigorously for President Johnson's domestic and foreign policies.

Possible Transfer of Authority. In late January, Humphrey prepared to shoulder presidential responsibilities while President Johnson was hospitalized with a cold and sore throat, but the president recovered quickly. On October 8, while the president was under anesthesia for about four hours during a gall bladder operation, Humphrey again stood by. Johnson and Humphrey drew up a written agreement in 1965 authorizing the latter to exercise presidential powers if the president should become disabled.

"Official" Activities. By presidential assignment or by statute, Humphrey attends cabinet meetings, is a member of the National Security Council, and serves as chairman of the Peace Corps National Advisory Council, the National Aeronautics and Space Council, the President's Council on Youth Fitness, and the Special Cabinet Task Force on Travel U.S.A. Late in 1965, Johnson ended Humphrey's role as overseer of the government's civil rights activities.

The vice president presides over the Senate. On September 13 his tie-breaking affirmative vote on an amendment to the farm bill permitted the secretary of labor to continue restrictions on the importation of foreign farm workers.

Spokesman for the President. Humphrey's most significant activities in 1965 derived from his close relationship with the president, and the knowledge by others that when Humphrey spoke, he spoke for the president. "I'm in the executive branch now," he said. "My job is to promote the policies of this administration." Humphrey exerted his influence on Capitol Hill in behalf of Johnson's "Great Society" legislative program. He worked particularly hard for the farm, poverty, and foreign aid bills. Once a week he reported to the president on the status of every administration bill.

In conferences with delegations of mayors, Humphrey emphasized the president's concern about urban problems. He told businessmen that the administration had faith in business, that it could not achieve its goals without the help of business, that the country's future depended on the economy, and that profits are necessary in our society.

Daily briefings kept Humphrey informed of world events. He supported U.S. interventions in Vietnam and the Dominican Republic, to the dismay of some liberal friends. In June, during a trip to Paris with two U.S. astronauts, Humphrey explained U.S. policies to French President Charles de Gaulle.

From Dec. 27, 1965, to Jan. 2, 1966, Humphrey visited Japan, South Korea, Nationalist China, and the Philippines, where he attended the inauguration of President Ferdinand E. Marcos. He sought support for U.S. policies in Vietnam.

Politics. The vice president spoke frequently at Democratic party fund-raising dinners, and he counseled the large crop of Democratic freshmen congressmen. Some liberals frowned on his support of run-of-the-mill (and unsuccessful) Democratic machine candidates in New York City and Philadelphia.

Humphrey's support of the administration permitted his rivals for future leadership in the party, Senators Robert and Edward Kennedy, to make a bid

HUBERT HUMPHREY (l.) is sworn in as vice president by John McCormack, speaker of the House, on Jan. 20, 1965. Fred Gates, a friend of Humphrey, holds Bible used for oath.

for liberal support. When Edward Kennedy (D, Mass.) sought to abolish poll taxes in state and local elections, Johnson and Humphrey, doubting the constitutionality of such a step, successfully opposed it, but some liberals admired Kennedy's efforts. Robert Kennedy (D, N.Y.) occasionally voiced misgivings about administration foreign policies that Humphrey supported. The tacit challenge to Humphrey's liberalism underscored a hazard that one faces in serving as vice president of the United States.

HUNGARY

Hungary remained one of Moscow's most trusted and faithful allies in 1965. The government followed the Soviet lead in relaxing some of its more stringent political and economic controls. Like other Soviet-bloc countries, Hungary responded to President Charles de Gaulle's gradual disassociation from U.S. policy by seeking closer ties with France. Hungary also echoed Soviet criticism of U.S. involvement in Vietnam.

Internal Affairs. In regard to the so-called liberalization of Communist rule in Hungary, the Communist party adopted a resolution in July calling for open, sincere, and full reporting on domestic and foreign affairs. Yet there was no liberalization of policy toward the Roman Catholic Church, and in the same month two groups of priests were jailed for alleged "antistate crimes." The Vatican warned that this action might endanger its improved relations with Hungary and adversely affect the negotiations over the fate of József Cardinal Mindszenty, who has lived at the U.S. legation in Budapest since the 1956 revolution.

In July, several changes in the party and government structure were made public. János Kádár resigned as premier but retained his position as the first secretary of the Communist party. The official explanation given for the change was that Kádár

needed to be relieved of the excessively heavy burden of dual leadership. Deputy Premier Gyula Kállai was promoted to the post of premier. He is an intellectual and party ideologue, who during World War II had been one of the leaders of the Communist underground. After the war he held high government and party positions until his purge by the party chief, Mátyás Rákosi, in 1951. Rehabilitated in 1955, Kállai is known to be a close friend of Kádár.

Foreign Relations. Maintaining close friendships with the Soviet Union and the other members of the Soviet-bloc countries remained the cornerstone of Hungary's foreign policy. In late January, Leonid I. Brezhnev, first secretary of the Soviet Communist party's Central Committee, and Nikolai V. Podgorny, another powerful member of the Central Committee, held secret talks with Hungarian party and government leaders in Budapest. It is assumed that these talks centered on the need for a common strategy in face of the Chinese challenge to Soviet leadership in international Communism.

There were rumors after the visit that Soviet troops might be withdrawn from Hungary as an outcome of these talks. In a speech on February 11, Premier Kádár laid these rumors to rest when he declared that Soviet troops would remain in Hungary until the West agreed to Soviet proposals for disengagement in Europe.

In May, the Soviet foreign minister, Andrei A. Gromyko, paid a visit to Budapest. He was believed to have discussed French President Charles de Gaulle's proposals for closer East-West relations and the situations in Vietnam and the Dominican Republic. In the same month, Premier Kádár, accompanied by Deputy Premier Antal Apró and Central Committee Secretary Béla Biszku, spent a week in Moscow, where they were received by Brezhnev and Premier Kosygin. A joint communiqué expressed "full identity" of views. Subsequently a trade protocol was signed, promoting further coordination between the economic planning of the two countries.

Hungarian Foreign Minister János Péter visited Paris in January, and London in July. In Paris he expressed interest in President de Gaulle's plan for

HUNGARY · Information Highlights

Net Material Product (1964): \$14,500,000,000.
Economic Indexes (1964): *Industrial production*, 173 (1958=100); *cost of living*, 100 (1958=100).

Foreign Trade (1964): Exports, \$1,352,000,000 (chief exports, 1963: transportation vehicles, \$140,000,000; metals, \$113,000,000; meat and products, \$76,000,000; fruit and vegetables, \$71,000,000); imports, \$1,461,000,000 (chief imports, 1963: metals, \$110,000,000; textile raw materials, \$95,000,000; solid fuels, \$88,500,000). Chief trading partners (1963): USSR (took 35% of exports, supplied 33% of imports); Czechoslovakia (took 11% of exports, supplied 12% of imports); East Germany (took 9% of exports, supplied 10% of imports).
Transportation: Roads (1963), 18,165 miles (5,813 paved); motor vehicles (1963), 77,100 (automobiles, 32,000); railways (1963), 5,447 miles; merchant vessels (1964), 12 (14,000 gross registered tons); state airline, Hungarian Air Lines (Malév); principal airport, Budapest.
Communications: Telephones (1964): 505,198; television stations (1964), 8; television sets (1964), 500,000; radios (1963), 2,452,000; newspapers (1963), 23 (daily circulation, 1,689,000).

Area: 35,919 square miles.

Population: 10,146,000 (June 30, 1965 est.).

Chief Cities (1963 est.): Budapest, the capital, 1,899,746; Miskolc, 159,829; Debrecen, 139,630; Pécs, 126,965; Szeged, 107,326.

Government: President—István Dobi; Communist Party First Secretary—János Kádár; Premier—Gyula Kállai; Parliament—National Assembly (340 members).

Religious Faiths: Roman Catholics, 59% of population; Protestants, 30%; others, 11%.

Education: Literacy rate (1960)—97% of population aged 15 and over. Total school enrollment (1962)—1,873,771 (primary, 1,472,700; secondary, 179,406; technical, 154,341; higher, 67,324).

Finance (1965 est.): Revenues, \$8,400,000,000; expenditures, \$8,400,000,000; monetary unit, forint (11.74 forints equal U.S.\$1).

an independent Europe. He discussed the question of German reunification and the problem of world disarmament with French Foreign Minister Maurice Couve de Murville. The question of long-term Franco-Hungarian agreements on economic, technical, and cultural exchange was also explored.

Relations between the United States and Hungary again left much to be desired. Hungarian leaders have persistently attacked U.S. policy on Vietnam. On February 13 there were anti-American riots in Budapest and the U.S. legation was damaged.

Economy. In 1964, industrial production rose by 9%, while national income and agricultural production grew by 4% and 2%, respectively. These figures did not satisfy Lajos Fehér, a member of the Politburo, who in January blamed obsolete marketing methods and a lack of concern over raising productivity for the "slow progress of the economy." For this and other reasons, changes in economic planning were made. The revised plan for 1965 called for a sharp drop in the rate (4.5%) of industrial growth. The target for agricultural production was reduced to about 2%. The number of large investment projects was reduced by a third. The plan stressed qualitative rather than quantitative improvements and called for higher productivity.

In a parliamentary debate on the budget on February 11, Premier Kádár recommended that Hungary should follow the Soviet example in basing production on consumer demand. "Certain parts of the Hungarian economy," he said, "would have to be developed so that both the efficiency of central direction and the self-reliance of the factories should increase. Strongly centralized economic direction is slow and dragging."

Foreign Trade. The revised plan for 1965 called for a 10.1% increase in exports in order to improve the country's unfavorable trade balance, which was primarily the result of heavy purchases from six Western countries. There was a deficit of 1.1 billion foreign-exchange forints in 1964. Increased trade was planned both with Communist and non-Communist countries.

WAYNE S. VUCINICH
Professor of History, Stanford University

HUNTING AND FISHING

According to figures released by the U.S. Department of the Interior in April 1965, state fish and game departments reported a new high in the sale of hunting and fishing licenses and permits during fiscal year 1964. Important advances were made in the field of wildlife conservation during 1965, especially in regard to the breeding grounds of both waterfowl and fish.

Licensing. The total number of hunting licenses issued during fiscal year 1964 was 14,122,659, valued at more than \$72 million—an increase of nearly \$4 million over the previous fiscal year. Pennsylvania, with 862,603 hunting-license holders, was the state leader. The number of fishing licenses, tags, permits, and stamps was 20,219,457, valued at more than \$60 million—an increase of nearly \$2.5 million over the previous year. California, Minnesota, and Wisconsin had the largest number of fishing-license holders, issuing over 1 million each. (The Department of the Interior pointed out that licensing figures are not an accurate measure of the total number of fishermen and hunters because many sportsmen are exempt for various reasons, such as age limitations. However, the figures are impor-

tant since they serve as the basis of distributing federal aid to the states for fish and wildlife conservation.)

Conservation. Considerable progress has been made in preserving wetlands for waterfowl nesting. After World War II, there was a decrease in nesting areas because of the widespread elimination of wetlands by drainage in the northern prairie states and the filling in of coastal marshes for lagoon homesites and commercial purposes. In 1958 Congress increased the cost of Migratory Bird Hunting Stamps, the source of most federal aid in this field, from \$2 to \$3. At the same time it authorized establishment of Waterfowl Production Areas on small wetlands, and started a 7-year, \$105 million purchase and lease-loan program against future stamp receipts. So far, a total of \$32.5 million has been appropriated under this program.

Most of the money is spent in the waterfowl breeding areas of North and South Dakota and Minnesota by the purchase of permanent water areas. In addition, payments are made to private landowners in return for an agreement not to drain specific semipermanent water areas. Removal of land from local tax rolls created a problem which is being relieved by subsequent legislation, but in the interim the emphasis shifted to the private-ownership subsidy program.

Between July 1, 1964, and June 30, 1965, 200,000 acres came under government protection, as compared with a total of 155,000 acres in the four previous years.

Far-reaching benefits for sport and commercial fishing are expected from the National Anadromous Fishery Program Act, passed in 1965. The law authorizes cooperative projects between federal and state governments to improve conditions for anadromous fish—those that live in the sea or Great Lakes and migrate up streams to spawn, such as salmon, shad, and striped bass. Improved spawning areas, fish hatcheries, and free migration conditions for the fish are among the projects authorized by the new act. Work under the program will be covered by agreements between the secretary of the interior and individual states or groups of states acting jointly. Federal appropriations of up to \$25 million will be made during the period ending June 30, 1970.

Sport Fishing Records. Two new additions were made in 1965 to the official list of freshwater fishing records compiled by *Field & Stream* magazine: spotted bass (7 pounds), on January 24 by Edward T. Simrell at Smith Lake, Ala.; and redear sunfish (2 pounds, 15 ounces), on March 6 by Ronald D. Gray, Jr., at Ponte Vedra Beach, Fla.

The International Game Fish Association (IGFA), which compiles official saltwater records, announced three new records in the all-tackle class: permit (50 pounds), on March 27 by Robert F. Miller at Miami, Fla.; pollack (43 pounds), on Oct. 21, 1964, by Philip Barlow at Brielle, N.J.; and porbeagle shark (400.5 pounds), on May 16 by James T. Kirkup at Fire Island, N.Y. The IGFA also reinstated as a record the 36-pound blackfin tuna caught off Bermuda in 1963 by Joseph E. Baptiste, Jr., after a larger fish was found to be the wrong species.

ICELAND

The volcano-born island of Surtsey drew increasing attention from scientists in 1965. They found much to study on the Westman Islands' newest member, which erupted from the ocean 75 miles southeast of the Icelandic capital of Reykjavik on Nov. 14, 1963. Surtsey has been declared a national preserve, off limits to casual visitors.

New Island. At first, Surtsey's survival was in doubt, its ash and pumice surface at the mercy of the Atlantic's winds and waves. But a flow of lava, beginning April 4, 1964, and continuing for 13 months, spread a protective skin over half of the island. Gradually, signs of life appeared. By the middle of 1965, seeds of a few coastal plants were in evidence, and molds, bacteria, and a few sea worms had established themselves. Scientists want to know in what ways water, winds, and birds have brought life to the island.

The generation of electricity by the volcano was apparent in flashes of lightning that occurred in the absence of thunderclouds. In another phenomenon, hailstones pelted passengers on nearby ships.

ICELAND · Information Highlights

Area: 39,702 square miles.

Population: 190,230 (Dec. 1, 1964 est.).

Chief Cities (1964 est.): Reykjavik, the capital, 77,220.

Government: President—Asgeir Asgeirsson; Prime Minister—Bjarni Benediktsson. Parliament—Althing; Upper House, 40 members; Lower House, 20 members; party seating (1965), both houses: Independence 24; Social Democratic 8; Progressive 19; Labor Union (Communist) 9.

Religious Faiths: Evangelical Lutherans, 96% of population; Roman Catholics, 0.5%.

Education: Literacy rate—99% of population. Total school enrollment (1962-63)—39,297 (primary, 24,050; secondary, 11,084; teacher-training, 216; technical and vocational, 3,127; university, 820).

Finance (1964 est.): Revenues, \$59,000,000; expenditures, \$55,000,000; monetary unit, króna (43.06 krónur equal U.S.\$1).

Gross National Product (1963): \$317,000,000.

National Income (1963): \$241,000,000; average annual income per person, \$1,296.

Economic Indexes (1964): Industrial (fishing) production (1958=100), 190; cost of living (1958=100), 162.

Manufacturing (metric tons, 1963): Cement (1964), 108,000; fish meal, 92,100; salted herring, 53,800; meat, 14,000; beer, 1,710.

Crops (metric tons, 1963): Hay, 354,500; potatoes, 7,600; turnips, 350.

Chief Mineral: Pumice (1964), 10,000 metric tons.

Foreign Trade (1964): Exports, \$111,100,000 (chief exports, 1963: frozen fish, \$26,600,000; salted herring, \$12,800,000; herringmeal, \$10,200,000; herring oil, \$7,000,000); imports, \$131,400,000 (chief imports, 1963: petroleum products, \$12,000,000; nonelectrical machinery, \$11,900,000; textile yarn, fabrics, \$8,700,000). Chief trading partners (1963): Britain (took 20% of exports, supplied 13% of imports); U.S. (took 16% of exports, supplied 12% of imports); West Germany (took 11% of exports, supplied 12% of imports).

Transportation: Roads (1964), 6,855 miles (24 paved); motor vehicles (1964), 29,224 (automobiles, 22,542); merchant vessels (1964), 23 (60,000 gross registered tons); civil airlines, Icelandic, Icelandic Airlines; principal airport, Reykjavik.

Communications: Telephones (1964): 47,938; radios (1963), 51,000; newspapers (1963), 5 (daily circulation, 82,000).

"Moon" Survey. In July, 28 members of a U.S. space team surveyed a section of Iceland believed to resemble the surface of the moon. The men, including some astronauts, performed duties similar to those that they someday may execute on the moon itself. The activities were conducted in the vicinity of the Askja volcano, which erupted in 1961.

Economy. Early in 1965, the Organization for Economic Cooperation and Development (OECD) reported that Iceland's soaring inflation had been slowed. But the OECD noted that rising wages and farm subsidies and an automatic wage-price escalator link would "make it difficult to achieve reasonably stable conditions in the near future." Citing a sharp increase in government spending, the OECD called for a "considerable tightening of fiscal policy." The national budget jumped 13% in 1965. A shift of the labor force from fishing and agriculture to construction and manufacturing continued in 1965. Industry is concentrated in Reykjavik, which has grown 25% in 10 years.

U.N. Support. In June, after some countries refused to pay peace-keeping assessments, Iceland and other nations made voluntary contributions to the United Nations. Iceland pledged \$80,000.

IDAHO

The Idaho Legislature met for 74 days in 1965—the longest session since the 1860's. It passed a 3% sales tax and increased the general budget to \$135 million—one third over the previous budget of \$101 million.

Finance. The 3% sales tax, which took effect in 1965, but will go before the voters for final ratification in a referendum in the 1966 general election, is expected to raise \$56 million in the 1965-66 biennium. (The proposal received double the number of signatures necessary to place it on the 1966 ballot.) Of the \$56 million anticipated from the tax, \$23 million will be used as a means of lowering income and general property taxes, and \$33 million will finance the budget increase.

The Legislature attempted to make assessment values for tax purposes more nearly uniform, but it set a higher rate for public utility property than for other types of property. As a result, the constitutionality of the act was placed before the courts.

Education. Education gained most in the increased budget. Public schools received \$57 million for 1965-66, as compared with \$40 million in 1963. The budgets of the two state universities increased from \$26 million in 1964 to \$33 million in 1965.

Both universities inaugurated new presidents during the year. Ernest W. Hartung became president of the University of Idaho, at Moscow, succeeding Donald R. Theophilus, who had been associated with the university for 37 years. William E. Davis replaced Donald E. Walker as president of the Idaho University at Pocatello.

Among other education news, Boise Junior College became a four-year, degree-granting institution, and six junior college districts were established in the state.

Reapportionment. The Legislature reapportioned itself in a seven-day special session immediately following the regular one. The state was divided into multicounty districts so that House members would represent nearly equal numbers of voters. The Senate plan calls for one senator from each county in

Area: 83,557 square miles.

Population: 702,000 (1965 est.).

Chief Cities (1965 est.): Boise, the capital (54,000); Pocatello (42,500); Idaho Falls (38,000); Twin Falls (21,000); Nampa (19,600); Coeur d'Alene (14,800); Caldwell (13,500); Moscow (12,700).

Government: Chief Officers—governor, Robert E. Smylie (Republican); lt. gov., William E. Drevlow (Democrat); secy. of state, Arnold Williams (D); atty. gen., Allan G. Shepard (R); treas., Marjorie R. Moon (D); supt. of pub. instr., D.F. Englekirk (D); chief justice, Henry F. McQuade. Legislature (convened Jan. 4, 1965): Senate, 44 members (19 Democrats, 25 Republicans); House of Representatives, 69 members (37 D, 42 R).

Education: School enrollment (1964-65)—public elementary, 99,866 pupils (3,650 teachers); public secondary, 82,912 pupils (3,400 teachers); nonpublic schools, 10,200 pupils (350 teachers); college and university (fall 1964), 18,129 students. Public school expenditures (1964-65)—\$56,450,000 (\$332 per pupil); average teacher's salary, \$5,150.

Public Finance (fiscal year 1965): Revenues, \$226,223,674 (motor fuel tax, \$19,935,037; federal funds, \$53,129,562). Expenditures, \$219,443,005 (education, \$13,988,078; health, welfare, and safety, \$26,578,641; highways, \$49,764,032). State debt, \$1,111,000 (June 30, 1965).

Personal Income (1964): \$1,398,000,000; average annual income per person, \$2,020.

Public Assistance (fiscal year 1965): \$10,573,764 to 17,895 recipients (aged, \$3,901,031; dependent children, \$4,512,289).

Labor Force (employed persons, July 1965): Agricultural, 106,000; nonagricultural (wage and salary earners), 211,300 (15.1% manufacturing, 20.3% trade, 19.1% government). Unemployed persons (July 1965)—10,800.

Manufacturing (1963): Value added by manufacture, \$365,695,000 (transportation equipment, \$5,032,000; nonelectrical machinery, \$5,048,000; fabricated metals, \$6,218,000; food and products, \$109,906,000).

Agriculture (1964): Cash farm income, \$489,758,000 (livestock, \$196,899,000; crops, \$265,108,000; govt. payments, \$27,751,000). Chief crops (tons)—hay, 3,302,000 (ranks 15th among the states); alfalfa, 2,894,000 (rank, 8th); sugar beets, 2,881,000 (rank, 2nd); potatoes, 2,082,000 (rank, 1st); wheat, 1,386,000 (rank, 11th); barley, 652,464 (rank, 4th); oats, 120,640 (rank, 19th).

Mining (1964): Production value, \$86,262,000 (ranks 32nd among the states). Chief minerals (tons)—silver, 16,483,000 troy ounces (rank, 1st); lead, 71,312 (rank, 2nd); zinc, 59,298 (rank, 3rd); copper, 4,666 (rank, 8th); iron ore, 4,500 (rank, 14th); gold, 5,677 troy ounces (rank, 11th).

Transportation: Roads (1965), 39,520 miles (10,555 paved); motor vehicles (1965), 445,058; railroads (1964), 2,666 miles; aircraft (1964), 1,290 (178 airports).

Communications (1965): Telephones, 260,000; television stations (1965), 9; radio stations (1965), 40; newspapers, 13 (daily circulation, 147,548).

the district. It was declared unconstitutional in December, and a special legislative session to reapportion was called for February 1966.

National Politics. Gov. Robert E. Smylie, chairman of the 1964 Republican Governors Conference, continued to lead liberals in this party who wished to wrest control from the party's more conservative element.

Congressional Grants. Congress established Nez Perce National Park, which includes important historical points situated on 22 separate parcels of land within a 6,600-square-mile area. It also appropriated money to start building Lower Granite Dam on the Snake River. Work on Dworshak Dam on the Clearwater River continued.

Weather. Destructive floods that struck the Pacific Northwest in January caused extensive damage to small towns, agricultural land, and roads in Idaho. One section of the state's main north-south highway was put out of service until September.

Heavy frosts destroyed much of the state's soft fruit. August rains decreased the value of cereal crops in the north, and September frosts and snows damaged potato, corn, and beet crops in the south.

University of Idaho

ILLINOIS

Illinois was one of the many states concerned with the problem of legislative reapportionment in 1965. The General Assembly was unable to achieve the reapportionment of either the House of Representatives, the state Senate, or Illinois' U.S. congressional districts. The Senate and the congressional districts were finally reapportioned by the courts, and the House by a bipartisan commission appointed by the governor.

Reapportionment. In September, after jurisdictional squabbling between the Illinois Supreme Court and a federal district court, the two courts entered the political thicket together and drew district lines for both the state Senate and the congressional districts.

After the General Assembly failed to reach agreement on reapportionment of the House, the governor appointed a 10-member bipartisan commission to do the job. The commission reached an agreement on December 4, but the new reapportionment map drew some complaints from southern Illinois Democrats.

Legislative Action. The reapportionment struggle was not the only excitement during the legislative session. (The lively session was due in part to the large number of new members elected in the special at-large election in 1964.) The legislature was rocked late in the session by a newspaper report of recorded conversations that suggested bribery among lobbyists for the state's currency exchanges. The legislature reacted to the disclosure by creating interim commissions to investigate the report and to consider conflict-of-interest legislation.

The legislature passed several significant measures. It approved a constitutional revenue amendment, to be submitted to Illinois voters in 1966, which would provide for a nongraduated state income tax. (Illinois does not have a state income tax.) Legislation implementing the state master plan for higher education provided in part for a junior college board to help establish a statewide system of junior colleges. The state primary election date was moved from April to June, making Illinois' primary elections the last to be held before the national political conventions. A new state Department of Business and Economic Development was created. The legislators also passed a series of crime-prevention bills and a number of measures to strengthen the state's food-inspection laws.

Floods and Tornadoes. Floods and tornadoes devastated parts of Illinois in the spring. The Quad-Cities area of Moline, East Moline, Rock Island, and Davenport (Iowa) was particularly hard hit when the Mississippi River crested there at seven feet above flood level on April 28. Seven persons were killed by tornadoes in the northeastern part of the state on April 11. President Johnson declared Illinois a major disaster area on April 28.

Stratton Acquitted. Former Governor William G. Stratton was acquitted of income tax evasion charges by a federal jury in Chicago in March. The decision had far-reaching implications. The prosecution asserted that Stratton had failed to report taxable income of over \$80,000 in his second term as governor (1957-60). The defense claimed that income from political contributions is untaxable.

Adlai E. Stevenson Rites. Adlai E. Stevenson, another former governor, who died in London on July 14, 1965, while serving as U.S. ambassador to the United Nations, was brought home to Illinois for burial. On July 17, thousands filed past the bier

Communications: Telephones (1965), 5,533,600; television stations (1964), 20; radio stations (1964), 170; newspapers (1964), 83 (daily circulation, 3,880,446).

where his body lay in state in the rotunda of the Capitol. After a state funeral in the Capitol, the body was taken to Bloomington for burial. Mourners at the services in Bloomington on July 19 included President and Mrs. Lyndon Johnson, Vice President and Mrs. Hubert Humphrey, Chief Justice Earl Warren, and Justice Arthur Goldberg, who succeeded Stevenson at the United Nations. (See STEVENSON, ADLAI EWING.)

Trade Delegation to the Far East. In November, Governor Otto Kerner led a group of Illinois businessmen to the Far East to stimulate trade with state firms. The governor had led a similar trade delegation to Europe in 1963.

Krebiozen. The drug Krebiozen, an alleged cure for cancer introduced in 1951, continued to be in the news. In a trial that lasted over 10 months the government charged Dr. Andrew C. Ivy and Stevan and Marko Durovic, promoters of the drug, with conspiracy, mail fraud, misleading advertising, and false statements to the government. Early in February 1966, the trial ended with the jury returning a verdict of acquittal on all counts for each of the defendants involved in the case. (See also CHICAGO.)

IMMIGRATION

President Johnson signed into law a new bill on Oct. 3, 1965, to amend the Immigration and Nationality Act. The new law gradually abolishes the national-origins quota system, eliminating it completely by July 1, 1968. The official title of the new bill is "An Act to amend the Immigration and Nationality Act, and for other purposes."

The new act provides a ceiling of 170,000 for immigrants from countries outside the Western Hemisphere, with a limit of 20,000 from any single country. Effective July 1, 1968, the bill places a ceiling of 120,000 immigrants annually from countries in the Western Hemisphere. The act exempts "immediate relatives" (children, spouses, and parents) from all numerical limitation. Also exempt are "special immigrants" who include Western Hemisphere natives, returning resident aliens, ministers of religion, and others. Within numerical limitations, selection of immigrants is made on the basis of preferences favoring family reunification and persons with talents and skills needed in the United States.

A record number of 186 million persons were inspected and admitted into the United States by immigration officials in the fiscal year ending June 30, 1965. This figure included multiple entries across the Canadian and Mexican borders. Of the total, 102 million were aliens and 74 million were U.S. citizens. Almost 3 million persons were members of ship or airplane crews, about 8 million were mainly passengers arriving aboard 83,816 vessels and 239,816 airplanes.

Immigrants. The total of 296,697 persons admitted for permanent residence in the United States in fiscal year 1965 was 1.5% higher than that in fiscal year 1964. While the number of immigrants born in Europe decreased by some 9,000, the number of natives of North American countries rose by approximately 14,000.

PRESIDENT JOHNSON speaks to audience on Liberty Island, New York Harbor, after signing immigration act, Oct. 3.

The number of quota immigrants admitted in fiscal year 1965 declined to 99,381—a 3.4% drop from 1964. Most of the decrease was among persons born in Germany and Britain.

Prior to the recent amendment of the Immigration and Nationality Act, preference classification was granted to highly skilled aliens whose services were urgently needed in the United States, and to specified relatives of U.S. citizens and permanent resident aliens. In the first-preference classification, highly skilled aliens admitted in fiscal year 1965 totaled 2,376, accompanied by 2,610 spouses and children. In the second-, third-, and fourth-preference classifications, 13,082 close relatives of citizens and resident aliens were admitted.

The number of nonquota immigrants increased 4.2%, to a total of 197,316. These included 153,199 natives of Western Hemisphere countries, chiefly Canada, Mexico, and Cuba, with spouses and children; 32,714 spouses and children of U.S. citizens; 6,315 admitted under special legislation; and 5,088 others.

An additional 3,184 refugee-escapees from Communist countries were paroled into the United States in fiscal year 1965. Under the Hong Kong parolee program, instituted by presidential directive in 1962, a total of 13,655 Chinese refugees had entered the United States by the end of fiscal year 1965.

Only 1,142 Cubans managed to escape from Cuba during 1965. Most of them had made the trip by boat and were picked up at sea by the U.S. Coast Guard in the Florida area. Since Jan. 1, 1959, when the Castro regime seized power, a total of 227,523 Cubans have entered the United States as refugees in temporary status, and 55,643 have been admitted as immigrants. (Some of these immigrants had entered as refugees in temporary status and are included in the 227,523 total of temporary entries.)

Nonimmigrants. Nonimmigrant aliens admitted in fiscal year 1965 increased 19% over 1964, to a total of 2,075,967. (The total excludes border crossers, crewmen, and Mexican agricultural laborers.) Tourists, mostly from Mexico, Canada, and Britain, numbered 1,323,479, an increase of 218,211 over 1964. Visitors for business reasons totaled 175,500, and aliens in transit totaled 142,686. Students admitted numbered 50,435; exchange visitors, 33,768; foreign officials, 57,333; and temporary workers and trainees, 67,869. In addition, 1,872,673 alien crewmen were granted shore leave, and 100,876 Mexican agricultural workers entered prior to the expiration of the Agricultural Act of 1949 on Dec. 31, 1964.

Deportable Aliens. The number of deportable aliens located during the 1965 fiscal year was 110,371—an increase of 27% over the 1964 figure. Among the violators were 39,213 visitors whose

status had expired, 32,938 illegal entrants, and 2,389 deserting crewmen. Aliens deported numbered 10,143, and those required to depart without formal deportation proceedings, 95,263.

Naturalizations. In the 1965 fiscal year, the number of persons naturalized totaled 104,299—a 7% drop from the previous year. Under general legal provisions, 76,630 petitions for naturalization were granted. Under special provisions, 24,516 persons were naturalized as the spouses or children of U.S. citizens, and 3,153 were found eligible for other reasons. A substantial group of those naturalized was the 7,914 natural or adopted children of U.S. citizens.

A total of 35,007 certificates of citizenship was awarded in the 1965 fiscal year. Among the recipients, 17,617 were children born abroad to U.S. parents, and 17,390 were persons who had married U.S. citizens or whose parents had been naturalized.

INCOME

The U.S. economy performed strongly in 1965. Production, income, and profits recorded marked advances; unemployment declined further; and the rise in prices, although somewhat larger than in recent years, was moderate. December 1965 marked the 58th consecutive month of the economy's expansion since the recession trough of February 1961—an advance of unprecedented length in the United States during peacetime. Public fears of another recession evaporated as business, consumer, and government demands continued to expand.

Expansion of National Output. The gross national product (the market value of total output) rose from \$629 billion in 1964 to a seasonally adjusted annual rate of \$667 billion in the first three quarters of 1965. (See Table 1.) By the third quarter of 1965, the GNP had reached an annual rate of \$677.5 billion, and for 1965 as a whole it was a little over \$675 billion—topping 1964 by 7.5% in current prices and 5.5% in real national output.

¹ Detail will not necessarily add to totals because of rounding. ² Data cover first three quarters and represent averages of seasonally adjusted quarterly totals expressed at annual rates. (Source: U.S. Department of Commerce.)

The remarkable 5.5% rise in real national output in 1965 followed on the heels of the substantial expansion (5%) in 1964. It seemed evident that the brisk pace of economic activity during these two years was due primarily to the impact of the Revenue Act of 1964, which provided for sizable reduc-

tions in personal and corporation income taxes. The 1964 tax cuts gave a powerful stimulus to total demand and production, and probably made the difference between a sluggish economy and the brisk economy of the 1964–65 period.

The performance of the economy in 1965 was somewhat stronger than that projected by the Council of Economic Advisers in its *Annual Report* of January 1965. A GNP of \$675 billion for the year would be near the upper end of the range in the council's January forecast, which at the time was more optimistic than most private projections. As the council predicted, the extra gains came from the great strength shown by two sectors of the economy: personal consumption and fixed business investment.

Consumer spending advanced very strongly in the first three quarters of 1965, and probably would account for as much as 70% of the GNP increase for the year as a whole. Although the surge in consumption was most notable in durable goods (especially automobiles), it extended across the board to nondurable goods and services. Fixed business investment in 1965 was expected to rise 13.5 over 1964, according to a U.S. government survey of investments anticipated by businessmen.

Residential construction did not expand greatly in 1965, but neither did it continue to decline as in 1964. The full-year result would probably show little change from 1964 in current-dollar terms, although it might be some 3% lower in real terms.

On the whole, the aggregate demand in 1965 continued to advance at a pace somewhat greater than the growth of the economy's capacity. The utilization of manufacturing capacity had risen by the summer of 1965 to a level slightly above 90%. Manufacturers prefer a 92% rate. The percentage of unemployment among the labor force had declined to 4.2% by November 1965. (Early in 1961, when the unemployment rate was about 7%, the U.S. government established an interim target of 4% unemployment as tantamount to full employment.)

The index of industrial production (covering manufacturing, mining, and utilities) was 8% higher in the first ten months of 1965 than in the corresponding period of 1964. The index in 1965 rose steadily through August, but then leveled out as the production of steel fell sharply. Following the negotiation of a new steel labor contract in late August, steel users found it necessary to liquidate the excessive inventories they had built up as a hedge against a possible prolonged work stoppage. As a result of this liquidation, the volume of iron and steel production declined by one fourth between July and October. (See *ECONOMIC REVIEW; HOUSING; INDUSTRIAL PRODUCTION.*)

National Income. The net current-production earnings of labor and property, as measured in the national income, expanded substantially between 1964 and 1965, in line with the growth of aggregate demand. As shown in Table 2, this rise of national income centered mainly on employee earnings (which accounts for more than two thirds of the total), corporation profits, net interest, and farm income. Business, professional, and personal rental income increased only moderately.

Particularly noteworthy was the further substantial advance in corporate profits. A strongly rising sales volume, stable labor costs per unit of output, and reduced overhead costs per unit raised corporate profits before taxes by about 60% between the first quarter of 1961 and the third quarter of 1965.

Because of reductions in federal tax rates, the relative increase in corporate profits after taxes was even larger than that of profits on a before-tax basis. There was no deceleration of the profit rise in 1965; nor was there evidence of a profit squeeze. Increases in profit margins had developed, restoring the favorable position of the early 1950's.

Corporate profits in 1965 rose to a record total of about \$45 billion after taxes, as compared with \$37.2 billion in 1964. The 20 million stockholders in the United States shared in this bonanza, by receiving dividends that were expected to exceed the record \$17.2 billion paid in 1964 by 8 to 10%.

One of the factors contributing to rising incomes is the increased efficiency gained by capital expenditures for more productive equipment. These expenditures totaled about \$51.5 billion in 1965, and were expected to exceed \$58 billion in 1966.

Flow of Personal Income. The current income received by individuals from all sources (as shown in Table 3) was at a seasonally adjusted annual rate of \$526 billion in the first three quarters of 1965. This was 7% above the rate for the corresponding period of 1964. By October of 1965, personal income had reached an annual rate of \$540

billion; this was \$5.5 billion below the September rate, which had included large retroactive payments of Social Security benefits. Exclusive of these, personal income expanded by substantial rates of 3% billion in September and 5% billion in October.

Personal Income by States. The dollar flow of income to individuals was at a record high in nearly all states in 1964, the latest year for which official estimates were available. Relative increases in total personal income from 1963 to 1964 were fairly uniform among the regions; only in the Rocky Mountain and Plains regions did the rate of income growth (3%) differ by more than one percentage point from the national average of 6.5% (see Table 4). By states, however, percentage changes in personal income from 1963 to 1964 showed substantial differences, attributable in large part to wide variations in the rate of change in farm income.

* The estimates of "state personal income" shown in this table differ in definition in one respect from the personal income data in Table 3: the exclusion from the state estimates of income disbursed by the federal government to its civilian and military personnel stationed outside the United States. (Source: U.S. Department of Commerce.)

On a nationwide basis, per capita personal income (total income divided by total population) rose by almost 5% between 1963 and 1964, reaching \$2,566. Differences among the states and regions in average income levels are recorded in Table 4.

CHARLES F. SCHWARTZ
Assistant Director, Western Hemisphere
Department, International Monetary Fund

KEYSTONE

DURING INDIA-PAKISTAN WAR in 1965, Indian police comb a section of rail line between Delhi and Meerut in search of Pakistani troops reported dropped from air.

INDIA

Armed hostilities between India and Pakistan dominated the Indian scene in 1965. They imposed new strains on India and raised grave questions for the future, but they also pushed serious internal difficulties into the background and seemingly strengthened the government of Prime Minister Lal Bahadur Shastri. Moreover, they created a new sense of national unity, determination, and purpose.

Shastri's sudden death, on Jan. 11, 1966, stunned the nation. The prime minister died of a heart attack in Tashkent, USSR, shortly after signing a troop withdrawal agreement with President Ayub Khan of Pakistan. Mrs. Indira Gandhi, daughter

of the late Prime Minister Nehru, succeeded Shastri on Jan. 19, 1966.

INDIAN-PAKISTANI CONFLICT

The Rann of Kutch. The first armed clashes occurred in the Rann (marsh) of Kutch, a desolate area in the Indian state of Gujarat. Minor clashes and firings by border forces along the ill-defined frontier became numerous in early 1965, and in April both India and Pakistan sent units of their regular armed forces into the area. Pakistani troops, using American-made weapons and equipment, moved into Indian territory (according to Indian sources, at least), and seemed to put the Indian forces on the defensive. No decisive military engagements were fought, however. Sober second thoughts by the

two contending governments, and pressures from friendly nations—notably the United States and Britain—led to a cease-fire.

The cease-fire agreement, signed on June 30, became effective the following day. It had been worked out earlier in the month at the Commonwealth Prime Ministers Conference in London. India and Pakistan agreed to withdraw their forces from the entire border between the two countries. They also promised to seek a settlement of the Kutch border dispute at the ministerial level, and, and if these efforts failed, to refer the dispute to an arbitral tribunal. Although the ministerial meeting was scheduled for August, it was not held because of growing tension over Kashmir. Thus the Kutch dispute remained unsettled in 1965.

Kashmir. More important is the dispute over Kashmir, the northern state occupied partly by India and partly by Pakistan after the partition of the Indian subcontinent in 1947. In the fall of 1965, Kashmir became the scene of the most serious clash between India and Pakistan since 1948.

After an apparent improvement in Indian-Pakistani relations in the last months of Nehru's life and immediately after his death (May 27, 1964), tension between the two countries grew more severe than ever. When India took several steps to integrate its portion of Kashmir more closely into the Indian Union, Pakistan viewed these moves with indignation and alarm. On May 8, 1965, Sheikh Abdullah, the former prime minister of Kashmir, was apprehended by Indian authorities upon his return from a trip to the Middle East, North Africa, and Europe. He was confined to a hill station in southern India. This action provoked protests in Pakistan and demonstrations in the Indian-held part of Kashmir.

Clashes and incidents along the cease-fire line in Kashmir became more numerous in 1965. On August 5, large-scale infiltration into the Indian-held portion of the state began from the Pakistani side of the 1949 cease-fire line. This infiltration, which according to Indian sources involved 5,000 or 6,000 men, was the immediate cause of the military hostilities in August and September.

Open Warfare. On August 16, Indian troops moved across the Kashmir cease-fire line in three strategic places. On September 1, a Pakistani infantry brigade, spearheaded by American-built tanks, invaded the Jammu section of Indian-held Kashmir. Four days later, Indian troops drove into West Pakistan proper, threatening Lahore, and on September 8 they attacked far to the south, toward Karachi. Shortly thereafter the Pakistanis invaded the Indian states of Punjab and Rajasthan. Several military engagements were fought, without decisive results, although apparently both sides lost many tanks and planes, and much other military equipment. The period of active fighting was confined to a few days, and was followed by two weeks of virtual stalemate.

India was threatened with a new crisis and a possible escalation of the conflict on September 16, when Communist China delivered an ultimatum giving India three days to withdraw from fortified installations along the frontier between Sikkim, an Indian protectorate in the Himalayas, and Tibet, which is occupied by China. The Chinese claimed the installations were on their side of the boundary line. The crisis was over in a few days: when India stood firm, China retreated from its ultimatum and claimed that Indian forces had withdrawn from the disputed border installations.

Cease-Fire. On September 20, the UN Security Council, with the United States and USSR cooperating in an unusual display of concerted action, passed a strong resolution demanding that India and Pakistan agree to a cease-fire within three days. India acceded promptly, and Pakistan acquiesced reluctantly at the last minute.

The cease-fire went into effect on September 23, in accordance with the United Nations resolution. It was an uneasy truce at best, and in the following weeks it was broken frequently by both sides. Neither India nor Pakistan withdrew its forces from the positions occupied after August 5, as each had agreed to do. But on Jan. 10, 1966, Shastri and Ayub Khan signed an agreement in Tashkent, USSR, providing for complete troop withdrawals by February 25. They also agreed to resume diplomatic relations and to renounce the use of force in settling disputes.

FOREIGN AFFAIRS

In 1965, India was so absorbed with its internal problems and its disputes with Pakistan that it gave relatively little attention to broader aspects of foreign policy.

Relations with Communist Countries. India's relations with Communist China remained strained, but aside from the Chinese ultimatum in September, no new crisis in these relations materialized. India was suspicious of China's apparent collusion with Pakistan, and of China's intentions in the Himalayan area. China's explosion of a second nuclear device in May, followed by its ultimatum in September, led to increasing pressure on Shastri from influential groups inside India, including members of his own party, to reverse his policy of not manufacturing atomic weapons. He refused to bow to these demands, although he made it clear that the question was continually under review.

Relations with the Soviet Union continued to be good, although not really close. The warmth of Shastri's reception in the USSR in May contrasted pleasantly to President Johnson's postponement of a similar visit to Washington and created a very favorable attitude in India toward the Soviet Union. This feeling was reinforced by the willingness of the USSR to continue its economic and military aid to India throughout the crisis with Pakistan.

WIDE WORLD

LAL BAHADUR SHASTRI was at the peak of his prestige as prime minister of India when he died on Jan. 11, 1966. His political position had been precarious in the first months of 1965 because of economic problems and widespread dissatisfaction that Hindi had been decreed the only official language. But he gained in stature later in the year for taking a firm stand toward Pakistan and Communist China during the Indian-Pakistani conflict.

Born in a village near Benares on Oct. 2, 1904, Lal Bahadur grew up in poverty. He adopted the name Shastri, which signifies academic achievement, when he graduated from Kashi Vidyapeeth University. Between 1921, when he joined Gandhi's noncooperation movement against British rule, and 1947, when India became independent, he spent nine years in prison for political activities. In 1951 he became secretary of the Congress party, and the next year he was named to the first of several cabinet posts that he held under Prime Minister Nehru. After Nehru's death, Shastri became prime minister on June 9, 1964.

PIX

Relations with the United States. President Johnson's request that Prime Minister Shastri postpone his state visit to Washington, scheduled for June, created considerable resentment in India. It led Shastri to announce on April 20 that he had canceled plans for the visit. But in the aftermath of the crisis with Pakistan, he reconsidered, and the trip was rescheduled for February 1966.

During the conflict with Pakistan, India's relations with the United States grew worse because of the suspension of U.S. economic and military aid. The failure of the United States publicly to condemn Pakistan's "aggression," coupled with Washington's alleged inclination to treat India and Pakistan on a similar basis during and after the conflict, further clouded Indian-U.S. relations.

Indians were incensed also by the refusal of the United States in June to renew a long-term agreement covering surplus food sales to India under the Food for Peace program. The United States extended the agreement on a month-to-month basis, making available 500,000 tons of grains at a time for purchase in Indian currency. This policy was intended to pressure India to increase its food production instead of relying so heavily (in Washington's view) on American food shipments. In December, President Johnson stepped up grain shipments to help alleviate the threat of famine in many parts of India. As a result, Indian-U.S. relations began to improve at the end of the year.

DOMESTIC AFFAIRS

Emergency rule in India, proclaimed immediately after the Chinese attack in late October 1962, continued throughout 1965.

Food Crisis. India's economic prospects were seriously blighted late in the year by the failure of the monsoon rains. The government called the drought "a natural calamity of a magnitude unknown in recent times." Because of the drought, food production was expected to be 7-10 million tons below the figure for 1964-65. This food loss would almost certainly mean famine conditions in many parts of India, and a serious internal crisis in the country as a whole.

Language Dispute. Hindi, the most widely spoken language of northern India, became the sole official language of the nation on Jan. 26, 1965. English was demoted to the status of an "associate language." The change provoked a wave of protests and riots, especially in the southern state of Madras. Two Indian government ministers resigned over the language issue on February 11. They withdrew their resignations when the government promised to support demands for constitutional restoration of English as an official language.

The "Syndicate." Although Prime Minister Shastri gained political prestige in 1965, real power seemed to rest with the so-called Syndicate. This inner group of Congress party leaders consists chiefly of party president Kamaraj Nadar and three other leaders: S.K. Patil, Sanjiva Reddy, and Atulya Ghosh. The politics and position of this group were sometimes openly criticized inside Congress party circles, most notably by Morarji Desai and some of his supporters at the party's annual session in January, and at the All-India Congress Committee (AICC) meeting in July. However, Desai's views did not prevail. In fact, the AICC approved a resolution permitting Nadar to be nominated for a second two-year term as Congress party president, beginning in December 1965.

State Politics. In various states, notably Kerala, Bihar, and Uttar Pradesh, the Congress party was faced with dissension within the top command and with defections of leading party members. Elections in Kerala in March left the political situation there still confused. The Congress party, whose ministry had resigned the previous September, was faced with formidable opposition, not only from "left-wing" Communists but also from dissident Congress party members, who united in what was called the Kerala Congress. The results of the election were a fresh blow to the Congress party, which won only 36 seats in the Legislative Assembly, as compared with 51 which it had held prior to the election. The Communists won 40 seats, and the Kerala Congress won 24. Because no party or coalition could form a government, president's rule, in effect since September, 1964, continued.

Economic Program. On February 27, Finance Minister T.T. Krishnamachari presented the general budget in the Lok Sabha (lower house of Parliament). The budget called for expenditures of \$4.4 billion in the revenue account for the fiscal year 1965-66. Expenditures for defense were estimated at \$1.5 billion, slightly higher than in 1964-65. To obtain the necessary revenue, Krishnamachari proposed increases in income and corporation taxes and in excise and customs duties. The capital budget envisioned an outlay of about \$4.7 billion in the public sector for the last year of the third five-year plan (1961-66).

The outlines of the fourth five-year plan, to begin April 1, 1966, took specific shape in 1965. The draft plan called for total expenditures of \$40-\$45 billion, and for a heavy emphasis on agricultural development and related programs.

INDIANA

A search, ultimately successful, for a legislative reapportionment formula held the spotlight in Indiana in 1965. Ten days before the General Assembly met on January 7, a federal circuit court overruled the Indiana Supreme Court and declared the 1963 legislative reapportionment act invalid.

Reapportionment. Before adjourning on March 8, the Democratic-controlled legislature approved a new legislative reapportionment. The state's 11 congressional districts were also reapportioned, for the first time since 1941. However, the circuit court declared the legislative reapportionment unconstitutional because of excess deviation from the "one-man, one-vote" principle and because it linked some urban and rural counties in districts in a manner that diluted the representation of the latter.

Gov. Roger D. Branigin then called the General Assembly into special session. During October the legislature approved four alternative reapportionment laws for each house and indicated the order of legislative preference. During November the federal court selected and upheld a reapportionment act for each house. Although not the initial choices of the legislators, these acts achieved the "one-man, one-vote" concept with less than 10% deviation in most instances. They also reduced the dilution of the vot-

ing strength of rural counties. Congressional reapportionment remained in effect.

Other Legislation. The regular session approved a biennial budget of \$1.74 billion for 1965-67, compared with \$1.44 billion for the preceding biennium. The 2% sales tax law was modified to exempt prescription drugs, the tax on cigarettes was raised, and the low-yielding state and local poll taxes were ended. Some \$25 million was appropriated toward construction of a public port on Lake Michigan. A "right-to-work" law was repealed, and a minimum-wage law of \$1 an hour was approved.

Economy. The Hoosier economy expanded amid continuing prosperity. Revenue from sales and other taxes exceeded budget estimates for the 1965 fiscal year. The increased acceptance by the state of federal funds for various purposes strengthened the state's fiscal position and boosted its economy. Governor Branigin took a number of steps to lower expenditures and encourage other economies.

Other Events. Tornadoes swept across central and northern Indiana on Palm Sunday (April 11), killing about 140 persons and destroying property worth millions of dollars.

The designation of New Harmony as a National Historical Landmark in August brought deserved recognition of the utopian experiments in communal living by the Rappites and Owenites.

In September, Clowes Hall, on the Butler University campus at Indianapolis, had the premiere performances of the newly organized Metropolitan Opera National Company.

The Indianapolis *Times* ceased publication in October after nearly 80 years of service to the city and state.

INDIANA · Information Highlights

Area: 36,291 square miles.

Population: 4,914,000 (1965 est.).

Chief Cities (1965 est.): Indianapolis, the capital (530,000);

Gary (179,000); Fort Wayne (172,000); Evansville (138,500);

South Bend (135,000); Hammond (115,500); Muncie (70,500);

Terre Haute (70,500).

Government: Chief Officers—governor, Roger D. Branigin (Democrat); lt. gov., Robert L. Rock (D); secy. of state, John D. Bottorff (D); atty. gen., John J. Dillon (D); treas., Jack L. New; supt. of pub. instr., William E. Wilson; chief justice, Amos W. Jackson. **Legislature**—General Assembly (convened Jan. 7, 1965); Senate, 50 members (35 Democrats, 15 Republicans); House of Representatives, 100 members (76 D, 22 R, 2 vacancies).

Education: School enrollment (1964-65)—public elementary, 719,622 pupils (23,530 teachers); public secondary, 431,035 pupils (18,440 teachers); nonpublic schools, 146,300 pupils (4,210 teachers); college and university (fall 1964), 127,954 students. **Public school expenditures** (1964-65)—\$495,918,000 (\$490 per pupil); average teacher's salary, \$6,530.

Public Finance (fiscal year 1965): Revenues, \$819,855,050 (2% sales tax, \$145,423,595; motor fuel tax, \$117,572,133; federal funds, \$152,788,078). **Expenditures**, \$795,078,582 (education, \$302,748,660; health, welfare, and safety, \$115,360,245; highways, \$284,523,570). **State debt**, \$456,037,500 (July 1, 1965).

Personal Income (1964): \$12,273,000,000; average annual income per person, \$2,544.

Public Assistance (fiscal year 1965): \$59,867,033 to 72,572 recipients (aged, \$22,474,602; dependent children, \$16,983,319).

Labor Force (employed persons, June 15, 1965): Agricultural, 95,900; nonagricultural (wage and salary earners), 1,613,500 (41% manufacturing, 19% trade, 14% government). **Unemployed persons** (June 15, 1965)—58,000.

Manufacturing (1963): Value added by manufacture, \$7,687,872,000 (transportation equipment, \$1,092,402,000; primary metals, \$1,417,541,000; nonelectrical machinery, \$682,946,000; electrical machinery, \$1,137,752,000; fabricated metals, \$459,524,000; food and products, \$611,228,000).

Agriculture (1964): Cash farm income, \$1,280,324,000 (livestock, \$674,211,000; crops, \$528,366,000; govt. payments, \$77,747,000). **Chief crops** (tons)—corn for grain, 9,457,000 (ranks 3rd among the states); hay, 2,403,000 (rank, 20th); wheat, 1,544,000 (rank, 9th); alfalfa, 1,440,000 (rank, 18th); oats, 245,000 (rank, 13th); apples, 55,200 (rank, 13th); rye, 22,000 (rank, 11th).

Mining (1964): Production value, \$211,783,000 (ranks 23rd among the states). **Chief minerals** (tons)—coal, 15,075,000 (ranks 7th among the states); crude petroleum, 11,283,000 barrels (rank, 19th); sand and gravel, 24,416,000; stone, 22,318,000; clays, 1,545,000; peat, 66,568.

Fisheries (1963): Commercial catch, 1,634,000 pounds (\$104,000).

Transportation: Roads (1965), 104,319 miles (97,492 paved); motor vehicles (1964), 2,527,530; railroads (1965), 7,772 miles; airports, 119.

Communications: (1965): Telephones, 2,137,300; television stations, 17; radio stations, 122; newspapers, 89 (daily circulation in 1964, 1,720,514).

INDONESIA

Although 1965 opened with Indonesia's withdrawal from the United Nations and with a rapid deterioration in U.S.-Indonesian relations, the most significant developments of the year were domestic. The dominant fact of political life in Indonesia was the growing polarization between left and right. The left—mainly the Communist party (PKI) and its allies—had the advantage of President Sukarno's strong public support and appeared to be developing a momentum which would ultimately give it a dominant voice in the government. But on October 1 an abortive internal army coup against the general staff reversed this trend. The army high command, with strong Islamic and other conservative support, reacted violently. Blame was placed on the PKI, and within a month it was on the verge of annihilation.

Foreign Affairs. Indonesia's formal resignation from the United Nations on Jan. 21, 1965, had little permanent effect on either her internal prosperity or her foreign relations. Endemic hostility to the United States since America's covert intervention in the 1957-58 regional rebellion was further exacerbated by the Vietnamese war, which reminded many Indonesians vividly of their own past experience. In the spring of 1965 all American enterprises were put under government control or supervision. Repeated, massive anti-American demonstrations resulted in the closing of the U.S. Information Agency's services, the withdrawal of the Peace Corps, and a virtual end to other aid programs. Ambassador Ellsworth Bunker's April mission to Indonesia, as President

INDONESIAN DEMONSTRATORS attacked the Indian embassy in Djakarta on September 8, after Indonesia's Foreign Minister Subandrio charged India with naked aggression against Pakistan.

ANTI-COMMUNIST DEMONSTRATION on October 8 was provoked by suspicions that the Indonesian Communist party (PKI) had participated in the attempted coup d'état of Oct. 1, 1965.

Johnson's special emissary, failed to check the continuing decline in relations between the two countries.

Although the Soviet Union continued to be the main supplier of arms to the strongly anti-Communist Indonesian army, prior to October 1 it was Chinese influence that expanded most rapidly, particularly within circles close to President Sukarno.

Although Indonesia carried on sporadic guerrilla incursions on the North Kalimantan (Borneo) frontier, confrontation with Malaysia was pursued mainly through diplomatic channels—and without much success. This lull was clearly in part the result of the deepening internal crisis. (See also ASIA.)

Internal Politics. In the fall of 1964 a group of right-wing newspaper editors banded together into the Body for Supporting Sukarnoism (BPS), with the intention of using Sukarno's name and writings to seize the ideological initiative from the PKI. With covert backing from the army, Islamic groups, and the tiny but influential Murba party, the BPS charged that atheistic communism was incompatible with Sukarno's public commitment to religion. A bitter press polemic ensued, which was not stopped until December 1964, when the BPS was first suspended and then banned by Sukarno, who accused it of being financed by the U.S. Central Intelligence Agency (CIA). Shortly thereafter he suspended the Murba

WIDE WORLD

PRESIDENT SUKARNO of Indonesia endured a massive blow to his prestige when the leftist coup and rightist countercoup of Oct. 1, 1965, discredited his pro-Communist, pro-Peking policies and left him in charge of the government at the sufferance of the military. His personal popularity probably was unscathed, but his bid to lead the Afro-Asian bloc seemed lost. It was thought that the coup may have resulted from a premature scramble for succession.

Sukarno was born in Surabaya, Java, on June 6, 1901. Educated at the Technical Institute of Bandung, he soon forsook civil engineering and architecture to join the drive to end Dutch colonial rule. From 1926 until 1949, when the Netherlands recognized Indonesia's sovereignty, he was the embodiment of the nationalist movement. Seeking any means to independence, he collaborated with the Japanese during World War II. After their capitulation, he proclaimed Indonesia's independence on Aug. 17, 1945, with himself as president. On May 20, 1963, the People's Consultative Congress made him president for life.

party. Simultaneously the left made a renewed attempt to change the composition of the cabinet and especially to oust the strongly anti-Communist armed forces chief, General Nasution. Strong right-wing pressure, however, blocked this maneuver.

Meanwhile, endeavors by Communist-led peasants to enforce existing land-reform legislation stirred violent reactions among Islamic and other landlords. Open clashes broke out, particularly in East Java, where the Muslims had the ill-concealed support of local officialdom. In March 1965, a large Afro-Asian Islamic Conference held in Bandung found Indonesian Islam expressing a new militancy and unity in the face of the Communist challenge.

On May 23 the PKI held its 45th anniversary celebrations which, particularly in Djakarta, were unprecedented in size, discipline, and impressiveness. Not only did the popular president himself give a warmly approving opening address, but government agencies were instructed to give the PKI maximum assistance and publicity.

Encouraged by this success, the PKI stepped up its campaign to reduce the power of its ultimate adversary, the army high command. Working largely through Sukarno, the party pressed for the introduction of political commissars into the armed forces and the creation of a fifth force of volunteers, outside the regular army. The PKI hoped thereby to give its cadres officially sanctioned military training and thus perhaps deter the army from attempting violent repression after Sukarno's eventual death. At the same time the PKI sought to isolate the army from its civilian allies. It scored a major victory on August 4, when the left wing of the Nationalist party (PNI) purged all top leaders thought to be sympathetic to the army. On September 21, Sukarno acceded to PKI demands that he ban the Murba party completely.

The Abortive Coup. It was beginning to seem that the PKI's strategy of peaceful penetration of the government might be successful, when, early on October 1, six of the key generals on the general staff were kidnapped from their homes. Soon afterward Djakarta Radio announced the formation of a Revolutionary Council with supreme powers to forestall an alleged CIA-backed generals' plot to overthrow Sukarno. But within hours the army high command, led by General Suharto, regained control, and the rebels fled the capital.

While certain aspects of this affair remain obscure, it appears that the initiative came from a group of strongly nationalist middle-ranking army officers in central Java. This group, discontented with the general staff for its reputed corruption, links with the West, and known coolness to many of Sukarno's policies, found allies among anti-army

elements in the air force. Although the PKI leadership was kept in ignorance of what was afoot, these air force elements did distribute about 3,000 small arms to Communist youth volunteers whom they had been training. On October 2 the main Communist newspaper came out in limited, bewildered support for what it still evidently saw as merely the arrest of its main political opponents. But this was enough for the enraged army. When the bodies of the kidnapped generals were discovered on October 3, the military high command launched a massive campaign to fix blame for the murders on the PKI.

Within a few weeks PKI activity was banned in all regions, the party press was closed down, and thousands of party members were jailed. In spite of Sukarno's public opposition, the army subsequently began the systematic obliteration of the left. It is reliably estimated that by February 1966, well over 300,000 men, women, and children had been slaughtered by the army or by Muslim and other army-inspired vigilante groups.

Also in defiance of the president, the army launched an anti-Chinese campaign, accusing Peking of having backed the abortive coup. Incited by the army-controlled press and radio, militant Muslim groups conducted violent attacks on locally born Chinese. The once close Djakarta-Peking entente thus appeared to have disintegrated completely.

The Aftermath. The appointment on December 14 of a three-man executive body, led by General Nasution and assuming many of the cabinet's vital functions, indicated that power in Indonesia had largely shifted out of the presidential palace and into the headquarters of the general staff. Yet in spite of the virtually dictatorial powers it had gained, the army high command faced serious problems. Military rule has neither traditional nor ideological legitimacy in Indonesia. Nor have the generals worked out any stable relationship with Sukarno and the political parties. Without the restraint exercised by a strong left wing there is a real danger of the government degenerating into a rigid, bureaucratic autocracy without any but the most conservative public support.

At the same time the national economy had come very close to breaking down. Rice prices quadrupled between July and November 1965. While industrial and communications equipment continued to decay, exports remained stagnant. The most critical question about Indonesia's future is whether the army leadership can create any kind of constructive political settlement, while tackling the uphill task of restoring and developing a ruined economy.

INDUSTRIAL HEALTH AND SAFETY

Problems in industrial health and safety arising from dusts, gases, and other harmful byproducts of industry continued to be analyzed by scientists and medical experts in 1965. Public concern and the work of health organizations have led to a broadened effort to understand the effects of these byproducts on health. New directions in environmental and occupational health research are expected to result in important changes in future industrial health and safety practices.

Environmental Health. A study of air samples and biological specimens from Los Angeles, Cincinnati, and Philadelphia was reported at the 1965 meeting of the American Industrial Hygiene Association (AIHA). This study was performed jointly by the U.S. Public Health Service's Division of Air Pollution and by industrial representatives.

Because of the increasing number of cars on congested highways, scientists in industry and government have maintained a careful surveillance of lead in urban air. They have concluded that, at the present low levels of pollution, no public health problem exists. Nevertheless, the California Institute of Technology announced that Dr. Claire C. Patterson has calculated that "pre-industrial" levels of human lead absorption may have been 100 times lower than those that existed in 1965.

In August 1965, plans for a National Environmental Health Sciences Center (NEHSC) were announced by U.S. Surgeon General Luther L. Terry (who retired later in the year), on his visit to the proposed site in the vicinity of Raleigh, N.C. The new NEHSC will undertake more complex studies than any currently being performed by industry, universities, or government. The increased depth and scope of these studies will include the full consideration of all environmental aspects of human ecological systems—total man in the total environment.

Occupational Health. Theodore F. Hatch, chairman of the Occupational Health Subcommittee of the Gross Committee, called for new concepts, principles, and practices if the course of chronic illness in the aging population is to be altered. Whatever the cause (heritage, childhood environment, present home and community environment, downward movement in socioeconomic class because of sickness, or job risk), it is evident that various groups have greatly different "stores of vitality" and therefore present different problems for maintaining health.

Industrial Toxicology. The Committee on Threshold Limit Values of the American Conference of Governmental Industrial Hygienists announced the tentative lowering of the maximum acceptable value for concentrations of carbon monoxide and phosgene in the air. The value for carbon monoxide was lowered from 100 to 50 ppm (parts per million) and the value for phosgene was lowered from 1.0 to 0.1 ppm.

The AIHA issued new guidelines on the uses and effects of allyl glycidyl ether, arsenic and its compounds (except arsine), beryllium and its compounds, carbon dioxide, carbon monoxide, chlorodiphenyls, 1,2-dichloroethane, diphenyl, ethyleneamine, fluoride-bearing dusts and fumes, iodine, lithium hydride, nitric acid, tetranitromethane, 2, 4, 6-trinitrotoluene, and vinyl chloride. Publications issued by the Industrial Hygiene Foundation listed existing threshold limit values, emergency exposure limits, and hygienic guides for 1965.

The first in a series of AIHA monographs on in-

dustrial hygiene aspects of the U.S. atomic energy program was published in 1964. The monograph, *Pulmonary Deposition and Retention of Inhaled Aerosols*, was written by Theodore F. Hatch, professor of industrial health engineering, Graduate School of Public Health, University of Pittsburgh, and by Dr. Paul Gross, director of the research laboratory, Industrial Hygiene Foundation. It presents in detail the important factors that determine why one exposure may be dangerous and another may be harmless. (See also POLLUTION; PUBLIC HEALTH.)

INDUSTRIAL PRODUCTION

Industrial production in the United States continued to rise in 1965, the fifth consecutive year of such expansion. The Federal Reserve seasonally adjusted production index climbed to successive new peaks each month from January through August. In September, for the first time in 11 months, the index fell slightly—less than 1%—because of a sharp cutback in iron and steel output and temporary work stoppages that curtailed aircraft, auto, newspaper, and coal production. However, the index moved upward again in each of the last three months of the year, reaching a December peak of 148.3, or 48.3% above the 1957–1959 average. The December 1965 index stood 7.4% above that of December 1964. For all of 1965, the index averaged 143, or 8% above 1964.

The increase in output reflected strong demand from consumers and business. Consumer demand was further stimulated in April 1965 by the elimination or reduction of federal excise taxes on a wide variety of consumer goods.

New production highs were recorded in 1965 by

all four broad industry groups—durable goods, nondurable goods, mining, and utilities. Durable goods, led by the machinery and automobile industries, paced the 1965 production rise with a 10% gain, one of the largest year-to-year gains in the postwar period. Nondurable goods output rose 6%; mining, less than 3%; and utilities, 7%, about equal to the average gain of the past five years. Production in all major industrial divisions advanced from 1964 to 1965, and in all cases it exceeded the output in any previous year.

The output of business equipment (for industry, commerce, transportation, and farms) rose 10%, and accounted for most of the 7% gain in final products. The other component of final products—consumer goods (automotive products, home goods and apparel, and consumer staples)—rose less than 6% despite fairly large gains in the auto and radio-TV groups. The output of materials for further processing increased 8%.

Despite the sizable production gain, manufacturing industries fell short of their full production potential. In mid-1965, U.S. manufacturing plants operated at 90% of capacity, the highest rate since 1955 and some 2% above December 1964, but still below the preferred rate of 92%.

Durable Manufactures. The steel industry recorded a record production year in 1965 despite a relatively low fourth quarter. Developments in the labor-management contract talks caused steel output to fluctuate. During most of the period of negotiations, ingot steel was produced at an annual rate of 140 million tons. With the signing of a new contract early in September, steel users began to reduce their stocks of steel built up earlier as a safeguard against shortages if a strike developed. As a result, producing mills cut back production sharply to an annual rate of about 110 million tons in October—

a drop of more than one fifth. Production for all of 1965 totaled 131.2 million tons, which compared with 127 million tons in 1964.

Supplies of nonferrous metals expanded in 1965 as the result of higher domestic production and increased imports. Metal producers operated at or near capacity levels. New production peaks were registered for such major metals as aluminum, copper, and zinc. The tightness in the supply-demand position that prevailed for copper, lead, and zinc in the last half of 1964 generally continued in 1965.

Output of building materials generally followed the course of activity in the construction industry, which reached a high level in June and changed little thereafter. Lumber production, after rising in the early months of 1965, dipped somewhat. Output of clay and glass products increased moderately.

The machinery industry showed outstanding strength in 1965. This industry, which produces electrical and nonelectrical machinery and equipment, recorded an advance of 13% from 1964 to 1965. (From 1963 to 1964 the increase was less than 10%.) The production increase in the machinery industry was the largest recorded by the 20 major manufacturing industrial groups of the Federal Reserve index, and it accounted for nearly three points of the 11-point advance in total industrial production.

The enlarged output of the machinery industry reflected the substantial expansion in private business outlays for new plants and equipment, which have run at record levels in recent years. These outlays totaled \$50.9 billion in 1965, up \$6 billion from the amount spent in 1964.

Electrical and nonelectrical machinery shared about equally in the advance. The rise in output was above average for some machinery lines, especially industrial equipment, which benefits from expenditures for plant expansion.

The electrical machinery industry benefited from the substantial increase in production of color television sets, which was almost double the 1964 volume of nearly 1.4 million units. This advance was achieved without any loss of production in black and white sets, which remained at the record-setting 1964 level.

The automobile industry registered new production records in 1965. Assemblies of passenger cars and trucks either exceeded or barely missed the million-unit mark each month except during the model-changeover period in the summer. For 1965 as a whole, production totaled 11.1 million units—the largest number ever produced—of which 9.3 million were passenger cars. In 1964 the figures were 9.3 million and 7.8 million units, respectively.

In the aircraft, shipbuilding, and railroad equipment industries, production rates changed little in the early months of 1965, but then moved noticeably upward, for a September index substantially above that of September 1964. Most of the expansion occurred in the aircraft and parts industry, which has been strongly supported by a rising volume of new orders and an increasing backlog of old orders for both military and civilian planes.

On the other hand, the output of railroad equipment increased only moderately over the high rate established in 1964, which, in turn, was the highest since 1957. However, new orders for freight cars were large, and backlogs rose from 31,000 in December 1964 to 42,000 in September 1965—the highest number of backlog orders since early 1960.

Nondurable Manufactures. The production gain in nondurable goods between 1964 and 1965 approxi-

mately matched the gain between 1963 and 1964. Output rates in midsummer reached new highs or ran close to earlier highs for all industry groups except leather and tobacco products. Among nondurables, textiles, apparel, and rubber and plastic products showed the greatest growth in 1965, with an increase of about 10% each.

Textile output has expanded since 1960. The increase in output from 1964 to 1965 was the largest during the upward business cycle of 1961-65, and came close to the large increase registered in 1959. (The 1959 rise stemmed from the industry's sharp recovery after the relatively depressed volume of the 1958 recession period.)

The most important factor in the 1965 increase was the strong demand for apparel, home textile furnishings, and industrial fabrics. Special congressional legislation in mid-1964 to reduce the cost of raw cotton to domestic users also contributed to the rise.

Small month-to-month gains in apparel output lifted the August index to 144.8 (1957-59=100). The expansion in output considerably exceeded the gain in apparel sales at retail stores, with the result that inventories accumulated at a fairly rapid rate.

In both the paper and chemical industries, output expanded further. Growth in the chemical industry continued to be influenced by the development of new production techniques and new uses of some important products. Thus, the annual rate of increase in output since 1960 has been nearly 20% for plastic materials and about 15% for man-made noncellulosic fibers. Output in typically slow-growing industries, such as petroleum products, foods, beverages, and tobacco products, registered only nominal gains over the 1964 level.

Minerals. The output of minerals continued to ex-

UNION CARBIDE PHOTO

AMERICAN INDUSTRY produced 8% more goods in 1965 than in 1964 as the business upsurge extended through its fifth year. Led by the machinery and automobile industries, durable goods manufacturing rose 10% during the year, and advanced even faster than nondurable—or soft—goods.

pand in 1965 at about the same rate as in 1964. Despite some temporary work stoppages, the production of bituminous coal increased 3% in 1965, to a total 509 million tons—the fourth consecutive year of higher output. Since coal exports in 1965 held about even with that of 1964, increased domestic consumption accounted for all of the gain. The petroleum industry continued to follow the pattern of moderate year-to-year gains that has been characteristic of the entire post-World War II period. Production rates for metal, stone, and earth minerals ran well ahead of 1964 levels.

Utilities. The monthly output of utilities generally moved upward. In September the rate was about 9% above the 1964 average.

INSURANCE

Brisk sales of life, health, and property liability insurance during 1965 reflected a sound United States economy, and the entry of a record number of young adults into the prime protection years. This article reviews major developments in the insurance field under the following headings: (1) Life Insurance; (2) Health Insurance; (3) Property and Liability Insurance.

LIFE INSURANCE

United States life insurance companies during 1965 paid a record \$11.4 billion in benefits to American policyholders, and in death payments to their beneficiaries. More than 90% of the life insurance owned in the United States is with legal reserve life insurance companies. American families owned an additional \$55 billion of life insurance provided through the Veterans Administration, fraternal societies, assessment associations, and savings banks.

New Purchases. Purchases of new life insurance during 1965 set an annual record. About 27 million individual policies and group certificates were issued, for a total of more than \$142 billion in new coverage. At the beginning of 1966, families with life insurance had an average of \$18,400 of protection. The total of life insurance owned neared the \$890 billion mark, a new record.

New purchases of group life insurance, for the most part issued through employers and unions, totaled over \$52 billion in 1965. This total includes \$28 billion in Servicemen's Group Life Insurance, issued to men and women in the armed forces. Among civilians, purchases of group life insurance was 9% ahead of 1964.

Over 7 million American workers were covered under insured pension plans at the end of 1965. The year's increase in number was the largest for any one year.

Investment. At the beginning of 1966, the total invested assets of the more than 1,625 legal reserve life insurance companies rose to nearly \$160 billion. The net earning rate on these funds, invested primarily in corporate securities, mortgages, and government and municipal bonds, was about 4.6% at the beginning of 1966.

Canada. Canada has the world's highest ratio of life insurance ownership to national income. At the beginning of 1966, Canadian families owned \$72 billion of life insurance under more than 22 million policies and group certificates. About \$875 million was paid in 1965 to Canadian life insurance policyholders, beneficiaries, and annuitants.

BLAKE T. NEWTON, JR.
President, Institute of Life Insurance

HEALTH INSURANCE

At the end of 1964, over 151 million persons in the United States, or 79% of the civilian population, were protected by hospital expense insurance. This was an increase of some 4 million during the year. Of those with hospitalization insurance, 93% also had surgical expense insurance, and 72% had regular medical (nonsurgical) protection.

Between 1954 and 1964, the number of persons protected by hospital expense plans increased by 50 million, and the number of persons covered by surgical insurance increased from 86 million to nearly 141 million. In addition, the number of persons covered by regular medical protection in-

creased from about 47 million to nearly 109 million.

Policies. More than 900 insurance companies issue health insurance policies in the United States. At the end of 1964, these policies protected over 93 million persons for hospital expenses, over 89 million for surgical expenses, and 55 million for regular medical expenses. Insurance companies also provided major medical expense insurance to 47 million persons, compared with 2 million in 1954. This insurance provides benefits up to \$10,000 or more to help pay for virtually all medical care, either in or out of the hospital, prescribed by a physician.

Benefits. Health insurance benefits totaling \$8.7 billion were paid by all types of insuring organizations in 1964, compared with \$7.8 billion in 1963. The 1964 total included over \$4.6 billion paid by insurance companies.

Loss-of-Income Policies. Coverage under loss-of-income insurance provides benefits that help replace income lost because of disability. In 1964, 36 million persons were protected in this way by insurance companies. Of the total employed U.S. civilian labor force in 1964, an estimated two thirds (48 million persons) were protected by loss-of-income policies or by other formal salary-continuation plans. Insurance companies paid over \$1 billion in loss-of-income benefits in 1964.

JAMES R. WILLIAMS
*Vice President and General Manager
Health Insurance Institute*

PROPERTY AND LIABILITY INSURANCE

The volume of premiums written by capital stock property and liability insurance companies rose more than 6% during the first half of 1965. Expenses continued to be reduced, but higher losses on claims kept underwriting results in the red, as they have been since 1955.

Fire and Other Hazards. In the first six months of 1965, estimated losses caused by fires in the United States totaled \$752,863,000, representing an increase of 4% over the comparable period of 1964. Estimated fire losses for the month of June 1965 totaled \$119,538,000, a jump of 2.2% over May, and 10.1% over June 1964. Extended coverage losses caused by windstorm, explosion, and certain other hazards totaled \$1,261,894,000 in the 12 months ending June 1965, compared with \$1,037,003,000 in the preceding 12-month period.

Crime Losses. Since 1958, crimes against property have risen 46%, with the result that crime has become a major insurance problem. In the first six months of 1965, automobile thefts, for example, soared 12.4% over the same period a year earlier, and auto thefts numbered 249,650.

Riots in Los Angeles in August resulted in millions of dollars of property damage. Some estimates place the insured damage alone at \$44,000,000.

Nuclear Energy Insurance. Property and liability companies are increasing the amounts of protection available to nuclear energy facilities. Beginning Jan. 1, 1966, stock and mutual pools will grant liability coverage up to \$74 million for each nuclear facility, compared with the \$60 million previously offered. At the same time, property coverage is expected to increase to \$72 million per installation.

UNITED STATES RUBBER COMPANY

INTERIOR DECORATION

Interiors designed for large public and commercial buildings dominated the news in interior decoration in 1965.

Public Buildings. With the opening in 1965 of the Los Angeles Museum of Art in three handsome pavilion-like structures, California's largest city became the unofficial artistic capital of the Far West. It was the largest art museum built in the United States since the National Gallery was completed in Washington, D.C., in 1941. The firm of William L. Pereira & Associates was the architect, with James H. Laugeheim as the partner-in-charge. Coordination of all interior furnishings was under the direction of Cannell & Chaffin.

Another important opening in 1965 was that of the Pavilion of the Los Angeles Music Center, with building design and interiors by architects Welton Becket & Associates.

The Mesda Museum building, of the Museum of Early Southern Decorative Arts in Winston-Salem, N.C., was opened in 1965. The principal function of Mesda is to preserve antiques associated with Old

Salem, founded in 1766. The museum is also dedicated to the study of handcrafts by early cabinet-makers, metalsmiths, artists, and potters.

The year also marked the opening of Lyndhurst, a house in early Victorian "Gothick" style located on the Hudson River near Tarrytown, N.Y. The house was designed in 1838-41 by the architect A.J. Davis, who also designed much of its furniture. It was left as a public museum by the late Anna Gould, Duchesse de Tallérand-Périgord, in memory of her parents. The Committee on the Restoration of Historic Interiors of the National Society of Interior Designers contributed advisory service and helped with the details of the interiors, from plans prepared by the National Trust. The plans were designed not to "restore" but to "preserve" the house and its furnishings as they were during the last years of occupancy by the donor.

Commercial Buildings. Interiors of the new San Francisco Hilton Hotel, which has 17 floors and 1,200 guest rooms, were designed by David T. Williams. Decorative lighting and painted murals were effectively combined in the dining room and in the lounges.

VICTORIAN DEN for Barbra Streisand's apartment, designed by Charles F. Murray, was one of the "Ten Best Dressed Rooms" exhibited at the National Design Center in New York. The walls, corduroy drapes, and velvet sofa are in tones of deep burgundy.

NATIONAL DESIGN CENTER

In Honolulu, the Ilikai, a condominium apartment-hotel overlooking the yacht harbor, was completed in 1965. The interiors were designed by The Designers, Inc.

Another hotel completed in 1965 was The Lodge of the Four Seasons, at Lake Ozark, Mo. Its interiors, in Western Spanish style with overtones of modern décor, were by Integrated Design Associates.

The Warwick Hotel, opened in Houston, has interiors designed by David T. Williams, except for some public areas by Frank Cuse and guest rooms by Maude McCullough. The hotel combines antique paneling with antiques and modern furnishings.

Seattle's Edgewater Inn, with interiors designed by Nancy Pope of the Maxwell Co., is in contemporary style traditionally slanted. The Kent Country Club, in Grand Rapids, Mich., used 18th century traditional design, planned by Irene Reed Badgley of Gertrude Muir Interiors.

The challenge confronting designers working on interiors of office buildings was met by Mildred English, Inc., in the offices for the 19-story Petroleum Building in Bartlesville, Okla. Designs for Dining, model public dining rooms by Everett Brown Associates for the National Hotel and Motel Association, showed new ideas in public rooms.

Art Nouveau. There was a resurgence of *Art Nouveau* styles in 1965. Wallpapers, fabrics, and lamps in that style were seen in a reproduction of Maxim's de Paris Restaurant, in Chicago, by Arne Bronton of Albert Pick Co., and in Palmer's Pub, also in Chicago, designed by Idea Associates.

The film *My Fair Lady*, with costumes and interiors in the *Art Nouveau* style by Cecil Beaton, was acclaimed for its correct period sets. Wallpapers, fabrics, and furniture were faithfully reproduced from documentary sources supplied by Clarence House.

Furniture Design. In furniture, authentic reproductions by di Lucca, Inc., were characterized by fine cabinetwork and carving. Superb styling was found in pieces by Roundtree and in the *faux bamboo* carved wood furniture, with caned seats

and backs fitted with shaped box cushions, by Meyer-Gunther-Marini.

Fabrics, Wallpapers, and Rugs. A new dimension in fabric design was seen in the collection by Jack Lenor Larsen, patterned after African primitive designs. Authentic museum reproductions were found in both wallpapers and fabrics. These included wallpapers by William J. Calligan in his "Heritage" collection, and in fabrics by Greff, including the American Legacy collection and the Henry Ford Museum reproductions. Eleven designs by Stroheim & Romann were taken from fabric designs in Cooper Union Museum documents. Fabrics and wallpapers were reproduced by Brunschwig & Fils for the restoration of Old Salem.

For those seeking enduring elegance in rugs, there were luxurious handwoven velours in designs adapted from museum documents, such as the superb needlepoint examples by Patterson, Flynn & Johnson. Rugs in modern exciting patterns were designed by Dorothy Liebes for Bigelow Sanford.

Rug Design Scholarships. A \$5,000 scholarship fund was established at the Parsons School of Design by Edward Fields, custom rug manufacturer, for students doing advanced work in carpet design.

Awards and Conferences. The American Institute of Interior Designers (AID) presented its International Design Awards at the 20th annual awards dinner, held in Chicago. Fourteen new products, selected from 400 entries from the United States and abroad, were honored for their attractive designs. The award-winning products were later exhibited throughout the United States. The AID held its 34th annual conference in New York City, and the National Society of Interior Designers held its 2nd annual conference in Washington, D.C.

UNITED STATES PLYWOOD CORPORATION

INTERNATIONAL FINANCE

Events and trends in international finance in 1965, including the much-discussed "liquidity problem," are reviewed in this article under the following headings: (1) International Financial Developments; (2) World Bank; and (3) International Monetary Fund.

INTERNATIONAL FINANCIAL DEVELOPMENTS

Despite continuing problems, the international exchange markets achieved more stability in 1965 than in recent years. At the beginning of the year there was an atmosphere of hesitancy arising from four major problems: (1) uncertainties about the prospects for improving the U.S. balance of payments; (2) a difficult liquidity situation that has raised doubts about the future structure of the international monetary system; (3) Britain's sterling exchange crisis of November 1964; and (4) doubtful prospects for other major currencies, such as the Italian lira and Japanese yen. Most of these problems abated, however, during 1965.

U.S. Balance of Payments. For years the U.S. balance-of-payments problem has caused concern, not only at home but also in financial circles in other countries. The U.S. position has remained adverse even though the nation's exports have been greater than its imports. In addition, receipts on interest and dividends; insurance transactions; legal, scientific, and other technical services; and film royalties have all been greater than payments to foreigners on these accounts. However, the high levels of income and savings in the United States, coupled with the great demand for investment in Europe and the less-developed countries, have led to a net flow abroad of American investment that is greater than the net receipts on ordinary transactions. For years, therefore, taking all accounts together, the United States has made net payments to foreigners, part of which have left the country in the form of gold.

In 1965 there were definite signs of improvement in the U.S. balance of payments, and although the problem could not be considered solved, it appeared

to be less intractable at the end of the year. The outflow of investment funds had been curtailed, both by changing circumstances in domestic financial markets and by new government policies in international finance.

The steady progress of the U.S. economy and the great demand for credit served to attract funds for investment within the United States. American companies which earlier had been attracted to foreign investment became more interested in expanding their home investment. Not only did investment within the United States appear to be more profitable, but, at the same time, investment in Europe appeared to be less attractive. The rise in U.S. interest rates also encouraged American companies doing business abroad to borrow in foreign capital markets rather than at home to finance their overseas activities. Hence, the outflow of funds for foreign investment declined. As a consequence, one of the important pressures on the U.S. balance of payments was reduced.

Official policies definitely encouraged the improvement in the U.S. position. They were directed toward reducing the outflow of funds for investment in developed countries without dampening the flow of finance to the less-developed countries. In a special balance-of-payments message in February, President Johnson proposed the continuation and extension of the interest equalization tax to discourage private lending to foreigners, a vigorous export drive, reduction of the government's overseas spending, and voluntary programs to encourage commercial and financial companies to reduce their expenditures in developed countries.

Businesses were requested to abide by a 9-point voluntary program that involved no restrictions or taxes on ordinary business transactions with any country, and thus was in line with the U.S. policy of encouraging the expansion of world commerce. The program did not discourage investment in countries other than the wealthier countries of western Europe, as well as Japan, Australia, New Zealand, and Canada. (Special arrangements, however, were made for investing in Canada.)

The Interest Equalization Tax was extended to cover loans extending more than one year made by

U.S. BALANCE OF PAYMENTS DEFICIT

THE UNITED STATES cut its balance-of-payments deficit in 1965 as government policies encouraged the expansion of exports and discouraged private lending to foreigners. Businessmen were urged to delay investments overseas to curtail further the outflow of American gold.

U.S. banking offices to foreigners. This action closed an important loophole in the tax on foreign lending to developed countries. Furthermore, the financial community—including banks, insurance companies, and other financial institutions—was requested to limit the increase in its total loans to foreigners to 5% of the amount outstanding at the end of 1964. This request did not restrict normal expansion in loans to less-developed countries, and minimized to some extent restrictions on loans to Canada, Japan, and Britain. Total foreign lending had not only been running at a high level in 1963 and 1964, but had shown signs of increasing rapidly in early 1965. Within these general guidelines, loans to foreigners for the financing of U.S. exports were to be given preference over other requests for credit. The essence of the voluntary program was an attempt to achieve a fairly sharp restriction in lending by banks and other financial institutions to the more developed Western countries. In December a new request by the government to the financial community called for a 4 to 5% increase in its foreign lending during 1966.

Undoubtedly, domestic economic conditions in the United States tended in 1965, unlike several previous years, to make investment at home more attractive than investment abroad. Even though the capital outflow from the United States likely would have abated in any event, there was a widespread acceptance by business of the voluntary programs. Business consciously reduced foreign investment below the levels that would have prevailed in the absence of the government's request. This adherence, and rising exports and other receipts from abroad, produced a considerable improvement in the U.S. balance of payments, plus a marked return of confidence in the dollar, as indicated by the amount of gold losses. Almost \$1 billion in gold was withdrawn from the United States in the first three months of 1965, but these losses became less than \$0.5 billion in the second quarter, less than \$0.25 billion in the third quarter, and insignificant in the last quarter.

Liquidity and Reserves. The so-called liquidity problem divides financial observers. Some doubt the long-run ability of the international monetary system to provide adequate financing for the prospective growth in international trade. Others fear that a more rapid growth in international reserves than that experienced in recent years would create dangerous inflationary pressures.

It is widely agreed that there is no urgent need to supplement the world's supply of international reserves, and that existing methods of creating international liquidity may suffice to meet the world's needs for some time. Nonetheless, it is also agreed that the world monetary system may need improvements in the future, well in advance of any possible shortage of international means of payment. Many problems of principle and technique would have to be considered.

Occasionally national differences in approach to changes in the international monetary system seem to reflect the differences in conditions among the various countries. The United States and Great Britain, troubled by balance-of-payments difficulties, appear to be concerned mostly about the long-run prospects for the stability of the international monetary system. Continental Europe, where prices have been rising more rapidly than in North America or Great Britain, gives greater weight to the inflationary dangers inherent in any undue ex-

pansion of international liquidity. The less-developed countries, dependent on the export of basic foods and raw materials—which, by the end of 1965, had been generally falling in price for more than a year—tend to support a more expansionary approach to questions of reforming the international monetary system.

In July, U.S. Secretary of the Treasury Henry Fowler suggested that the time might be nearing when an international conference should be held to discuss these questions. As yet, no definite plans have been made for such a meeting. However, the annual report of the International Monetary Fund, and also a special communiqué issued by the finance ministers and Central Bank governors of the ten major industrial countries, suggested in 1965 that it was now important to undertake a thorough examination of the functioning of the international monetary system and its probable future needs for liquidity. This examination was proceeding at the end of the year.

Britain's Balance of Payments. British authorities tackled their balance-of-payments problems by more general economic policies than those adopted by the United States. In late 1964 the British government raised taxes and trimmed its expenditures in order to hold back its citizens' willingness and ability to purchase goods, thereby reducing the demand for imports and making goods available for export. During 1965 further economies were made in government expenditure, and more restrictions were placed on private investment. Credit conditions were also kept tight to hold down demand.

In April, however, Britain took a step in the opposite direction by reducing to 10% the 15% special duties which had been imposed on many imports in October 1964. The balance-of-payments position improved during 1965, and confidence in sterling began to return, even though it was widely recognized that Britain's problems will continue to be serious for many years. The increase in confidence was evidenced by the improvement of sterling on the foreign exchange markets. At the beginning of the year the rate for the pound was close to the "floor" (£1 = U.S.\$2.78) that the Bank of England announced it would maintain, but by the end of the year the pound was quoted well above par. (See table in MONEY.)

Italian and Japanese Positions. The Italian and Japanese exchange positions improved during the year, although at the cost of slower domestic progress in both countries. However, their foreign accounts apparently were under control, and they may resume the rapid rates of progress maintained up to 1964.

International Monetary Fund

WORLD BANK

The International Bank for Reconstruction and Development, known informally as the World Bank, lent \$1.02 billion to 27 countries and territories in the fiscal year ending June 30, 1965. The World Bank's 38 loans during the fiscal year financed road, railway, electric power, industrial, agricultural, educational, and water supply projects. In all, the bank has made 424 loans, aggregating \$8.77 billion in 77 of its 102 member countries.

Organized in 1946, the World Bank is an international lending agency associated with the United Nations. It makes loans to member governments and, with the guarantee of the governments concerned, to their territories, public agencies, or private enter-

prises. As of June 30, 1965, the total subscribed capital of the bank was \$21.67 billion. Of this amount, however, only \$2.17 billion had been paid in. The remainder was subject to call, and may be used only to meet the bank's obligations.

Operations. Transportation development loans, amounting to \$411.7 million, made up the largest category of the bank's lending in fiscal year 1965. These loans financed road building in Finland, Gabon, Honduras, Iran, Jamaica, Japan, Mexico, Paraguay, and Venezuela, and railway projects in Nationalist China, Spain, and Yugoslavia. Loans totaling \$321.4 million were made for electric power projects in Brazil, Chile, India, Japan, Nigeria, Portugal, Sierra Leone, Thailand, Venezuela, and Zambia and Rhodesia. A total of \$179 million in industrial loans went to China, Finland, India, and Italy. Loans for agriculture, totaling \$78.2 million, were made to Morocco, Peru, Thailand, and Uruguay. Two loans for water supply, totaling \$27 million, were made to Malaysia and the Philippines, and a loan of \$6 million financed an educational project in the Philippines.

Technical Assistance. During 1965 the World Bank assisted member countries in preparing development projects and high-priority programs. It also acted as executing agency for preinvestment studies financed by the United Nations Special Fund. New courses in economic management were offered by the bank's staff college, the Economic Development Institute, to senior officials from less-developed countries.

International Development Association (IDA). An affiliate of the World Bank, IDA came into existence in 1960 to provide funds for economic development on terms that are more flexible and bear less heavily on recipient countries' balance of payments than those of conventional loans. Most of its funds are derived by means of subscriptions and supplementary contributions from the wealthier nations. By Aug. 31, 1965, 95 countries had become members, and their initial subscriptions had amounted to \$996 million. Usable funds from all sources totaled about \$1.6 billion.

In fiscal year 1965, the IDA extended 20 development credits, totaling \$309.1 million, to 11 countries. This brought IDA's total lending since its inception to \$1.09 billion in 29 countries. Transportation was the principal category assisted by the IDA in fiscal year 1965. Credits for this purpose, amounting to \$110.3 million, supported road development in Bechuanaland, Honduras, Kenya, Mauritania, Nigeria, and Somalia; railway improvement in India; and an inland water transport project in Pakistan. Agriculture was assisted in Kenya and Pakistan by credits totaling \$88.3 million. Credits totaling \$39 million were extended to Bolivia and Turkey for electric power development. A credit of \$33 million assisted India's telecommunications system. Credits for educational projects in Afghanistan and Nigeria totaled \$23.5 million. Industry in Turkey was assisted by a \$15 million credit.

(Information for this article was supplied by the International Bank for Reconstruction and Development.)

INTERNATIONAL MONETARY FUND

The International Monetary Fund (IMF), a regulatory and lending agency with responsibility for international monetary stability, had 103 member countries on Sept. 30, 1965, with quotas (subscrip-

tions) totaling \$15.97 billion. In the preceding 12 months, Malawi and Zambia joined as new members, and Indonesia withdrew.

During the fiscal year ended April 30, 1965, 29 members drew (purchased) a total of almost \$1.9 billion in 14 currencies, including for the first time Australian pounds and Mexican pesos. The total drawn was the second highest in IMF's history. Twenty-five countries repurchased nearly \$517 million in 11 currencies, including for the first time Austrian schillings and Japanese yen. Twenty-three countries concluded stand-by arrangements to obtain nearly \$2.16 billion when needed.

The IMF established initial par values for currencies with Burundi (87.5 Burundi francs equal U.S.\$1), Sierra Leone (0.714286 leone = U.S.\$1), and Trinidad and Tobago (TT\$1.71429 = U.S.\$1).

On Feb. 26, 1965, the IMF executive directors proposed a general increase of 25% in quotas for all members, as well as special quota increases for 16 members. The governors later approved both proposals. Members may consent to the increases in their quotas at any time before March 25, 1966, and the increases will become effective when consent is obtained from members who held two thirds of the total quotas on the date the increases were proposed.

Further consideration was given in 1965 to the problem of international liquidity, and the annual report of the executive directors suggests ways in which progress can be made toward reinforcing the international monetary system. During 1966, close liaison will continue between the IMF and the Group of Ten industrial countries that have also been studying the problem.

FRANK A. SOUTHARD, JR.
Deputy Managing Director, IMF

INTERNATIONAL LAW

The United Nations continued its efforts to promote and extend the rule of international law in 1965, principally through two of its agencies—the International Court of Justice (World Court) and the International Law Commission.

International Court of Justice. The court, which is the principal judicial organ of the United Nations and meets in The Hague, Netherlands, held oral hearings of cases involving South West Africa, from March 15 to July 14, 1965, and from September 15 to November 15. Ethiopia and Liberia, which had brought the cases against the Union (now Republic) of South Africa in 1960, charged that South Africa had failed to fulfill the terms of its 1920 League of Nations mandate over the former German territory of South West Africa by practicing apartheid (separate development of racial groups) in the territory. South Africa has refused to transform its mandate into a trusteeship under the United Nations as other mandatory nations have done. The court's findings in the South West Africa cases were not expected until 1966 at the earliest. (See also **SOUTH AFRICA**.)

On April 19, Kenya accepted the compulsory jurisdiction of the court in international disputes outside the Commonwealth of Nations, to which Kenya belongs. Exempted from the court's jurisdiction were all disputes "concerning any question relating to or arising out of belligerent or military occupation or the discharge of any functions pursuant to any recommendation or decision of an organ of the United Nations," in accordance with which Kenya has accepted obligations. This reservation constitutes an innovation. Kenya's action brought to 40 the number of nations that have accepted the jurisdiction of the court as compulsory in international disputes.

The paucity of cases referred to the court for adjudication is a matter of serious concern. The only one waiting to be heard at the end of 1965 was the *Barcelona Traction, Light, and Power Company case (Belgium v. Spain)*. UN Secretary General U Thant expressed the hope that states will "have more frequent recourse to the court as a means of settling their legal disputes." He declared: "The court has already established that it merits universal confidence, and if real progress is to be made in the peaceful settlement of disputes, I feel that the court should increasingly come to play the vital role envisioned for it in the [UN] Charter . . ."

International Law Commission. Established in 1948 by the UN General Assembly, the commission held its 17th session from May 3 to July 9, 1965. It undertakes studies and prepares draft codes, articles, and declarations for submission to the General Assembly.

At its 1965 session, the commission completed the second reading of part 1 of its draft articles on the three-part law of treaties. Part 1, concerning the conclusion, entry into force, and registration of treaties, had been revised in the light of written comments submitted by 23 governments. The commission decided to limit the scope of the draft to treaties concluded between states, and to exclude agreements made by (1) international organizations, (2) the Holy See, and (3) other international entities, such as insurgent groups, which in some circumstances may enter into treaties. The draft articles of all three parts will serve as the basis of a single multilateral convention.

The commission also decided to hold a special session in January 1966 in order to complete its work on the law of treaties before the present members' terms of office expire. The 15 members serve for three years in individual capacities.

In 1965 the commission adopted 44 articles of its draft on special missions and decided to communicate it to national governments for their comments. The term special missions or *ad hoc* diplomacy refers to that type of diplomatic relations between states that is constituted by itinerant envoys, diplomatic conferences, and special missions sent to a state for limited purposes. In preparing the draft articles, the commission sought to codify the modern rules of international law on the subject and therefore to include rules that had not yet been generally accepted. It hopes to complete this work in 1966.

The commission also requested governments to submit their views and suggestions as to whether special rules of law should be drafted on the status of high-level special missions.

Teaching of International Law. As early as 1947 the UN General Assembly requested governments to take appropriate steps to extend the teaching of international law in universities and institutions. In 1963 the assembly adopted three resolutions on the subject and established the Special Committee on Technical Assistance to Promote the Teaching, Study, Dissemination, and Wider Appreciation of International Law. This committee drew up a practical plan and proposals, which were adopted by the General Assembly on Dec. 20, 1965, during its 20th session.

The International Law Commission, inspired by the 1963 resolution, recommended that its publications be more widely disseminated among law school libraries and other interested libraries and institutions, and that seminars on international law for advanced students and young government officials be organized in conjunction with the commission's own sessions.

UN Conference on Transit Trade of Landlocked Countries. A conference attended by 58 governments concerned with the problem of transit trade of landlocked countries was held at UN Headquarters, New York City, from June 7 to July 8, 1965. There are 23 landlocked members of the United Nations, and this conference was the first of its type ever held. The conference adopted a convention which will enter into force when ratified by two landlocked countries and two transit states having a sea-coast.

Treaty Developments. During the period June 16, 1964, to June 15, 1965, 27 volumes were published in the UN Treaty Series. (Another 13 volumes, up to vol. 489, appeared by the end of 1965.) During the same 12-month period ending in June, 725 treaties and international agreements were registered with the UN Secretariat. This brought to 11,511 the number of treaties and agreements registered or filed and recorded from Dec. 14, 1946, to June 15, 1965.

INTERNATIONAL TRADE

World economic developments in 1965 resulted in a slowing in the rate of advance of free-world trade. Regional economic groups continued to make progress toward their respective goals. Negotiations under the General Agreement on Tariffs and Trade, however, made little headway.

TRADE DEVELOPMENTS

Through the first half of 1965, free-world exports were valued at an annual rate (projected total for the year) of \$159 billion, about 7% above the comparable 1964 level. Exports had expanded in 1964 by 12% over the previous year, and in 1963 by 9% over 1962. In 1965, shipments from the industrial countries increased more than twice as fast as those from the developing countries, but exports from both groups were far less buoyant than they were in 1964.

World Exports. The smaller growth rate for the developing countries' foreign sales was caused by a slowing in the expansion of demand for some of the foods and crude materials produced in those nations. In addition, prices for certain foodstuffs—notably sugar, coffee, and cocoa beans—were well below those in 1964. These declines were balanced to some extent by an increase in prices of ores and

¹ Not available.

metals, major quantities of which come from the developing countries.

Exports from the industrial countries through June 1965, though 9% above those in the first half of 1964, were not nearly so expansive as in the preceding year. Demand for foreign products in some of the major trading countries, such as the United States, Canada, and West Germany, continued strong, but in other countries—Britain, France, Italy, and Japan—there was little or no expansion over 1964. Sluggish import requirements for manufactured goods in the latter countries tended to hold down the average rate of increase in shipments from the industrial nations.

U.S. Imports. As a result of a booming domestic economy, U.S. imports increased with unusual sharpness in 1965. In the first 10 months they reached an annual rate of \$20.8 billion, nearly 14% above the January-October annual rate for 1964. The annual rate of exports, responding to a steady but not rising demand from Europe and the developing countries, increased only 3.5% in the same period. Thus, the U.S. trade surplus, which had climbed to a record \$6.9 billion in 1964, was expected to drop to \$5.2 billion. The latter figure, though representing a significant decline from the

1964 surplus, nevertheless exceeded the average favorable balance in the years 1960-63.

Imports through September 1965 (the latest detailed data available) registered sizable increases in all categories except food. Sharply reduced quantities of coffee, sugar, and beef were only partly balanced by increased arrivals of fish and animals for food.

Expanding American production, along with exceptional demands for steel because of a threatened steelworkers' strike until the end of August, produced large advances in imports of both industrial supplies and capital equipment. Purchases of foreign machinery were up by a third, an unusual expansion in a single year. Significant increases occurred in imports of many types of machinery (including agricultural, textile, and power-generating), and in engines and electrical apparatus. Imports of industrial supplies, representing about half of U.S. imports, rose by almost \$1 billion through September. Over one third of that amount stemmed from increased iron and steel mill products. Other foreign supplies purchased in significantly greater volume than in 1964 included nonferrous ores and metals (especially tin, nickel, and aluminum), wool, iron ore, pulp, newsprint, and petroleum.

As a result of a sharp rise in consumer expenditures and aggressive selling by foreign producers, imports for direct consumer use expanded considerably. Among the products finding wider U.S. markets were clothing, footwear, artworks, toys, musical instruments, television sets, and automobiles.

All areas of the world, except Africa, provided more goods to the United States in 1965, but by far the major part of the rise stemmed from western Europe, Japan, and Canada. In fact, more than half of the increase in U.S. imports through September came from the latter two countries. Japan provided much more iron and steel, as well as various kinds of electrical equipment, textiles, and other consumer goods. From Canada, the major foreign source of U.S. industrial raw materials, came more newsprint, lumber, nickel, and other nonferrous metals, as well as larger amounts of fish, motor cars, and agricultural machinery.

The developing countries earned only about \$175 million more from exports to the United States in the first nine months of 1965 than in the same period of 1964. Much of that was shipped from eastern and southern Asia, especially Hong Kong and India.

U.S. Exports. The value of exports of manufactured goods from the United States in the first three quarters of 1965 rose by 5% over the comparable period of the previous year, but agricultural shipments declined 3%. Wheat exports, cut by the absence of unusual sales to the USSR and outpriced in world markets in the early months of 1965, were off nearly a quarter in value. Shipments of cotton, some of which was also offered at noncompetitive prices, declined by almost one third. Expanded exports of coarse grains, fats, soybeans, and animal feed did not entirely compensate for reduced shipments of other agricultural products.

Nonelectrical machinery and aircraft led the rise among the manufactured exports. Increased shipments of tractors, mechanical handling equipment, office machines, and power machinery were offset in part by declining sales, compared with 1964, of metalworking machinery, construction equipment, and telecommunications apparatus. Increased ex-

ports of both military and civilian planes contributed to the 25% rise in the value of aircraft sales. Greater shipments of copper, in strong world demand, added to the export rise. However, exports of steel products fell as a result of greater domestic needs, the building up of stocks in anticipation of a strike, and lowered shipments by the U.S. Agency for International Development.

Canada was the only buoyant market for U.S. exports. Sales to that country were expected to be 13%

over 1964, while those to western Europe remained steady, and shipments to Latin America were expected to drop by about 3%.

U.S. Balance of Payments. Through the third quarter of 1965, the surplus on trade made a smaller contribution to the U.S. balance of international payments than it had in 1964. Nevertheless, the balance of payments account showed a substantial improvement over recent years, as the deficit through September was at an annual rate of only \$1.25 billion, compared with deficits of \$2.8 billion in 1964 and \$2.7 billion in 1963.

The improvement in 1965 stemmed in large part from implementation of the voluntary program, initiated February 10, whereby banks and business corporations cooperated with the U.S. government in an effort to improve the balance of payments. Net capital outflows reported by U.S. banks declined from nearly \$2.5 billion in 1964 to only \$130 million, on a seasonally adjusted basis, through the first nine months of 1965. At the end of September the amount of outstanding bank assets covered by the Federal Reserve System's guidelines under the voluntary program was about \$470 million below the

suggested limit, or at the same level as on Jan. 1, 1965.

This exceptionally favorable position was tempered somewhat by certain unfavorable developments. One unfavorable factor was the sharp increase in the first nine months of 1965 in net foreign sales of U.S. corporate securities. The sales were partly conversions by the British government of securities requisitioned from British residents at the beginning of World War II. A rise in purchases of new issues of foreign securities was another detrimental factor in the U.S. balance of payments position.

Data on capital movements by nonfinancial concerns, available only through June, showed an improvement of almost \$1 billion—from a net outflow to a large net inflow—as these corporations repatriated foreign assets. New direct investments through June, however, were valued at \$2.0 billion, far above the figure for either half of 1964. It was considered too soon for that figure to reflect fully the changes in corporate policy which may have been initiated in response to the new voluntary program to improve the balance of payments.

Canada. The Canadian trade surplus of \$50 million at the end of the first eight months of 1965 was only one tenth as large as the surplus a year earlier. Exports rose by less than 2%, while imports increased by 11.5%.

Sales to the United States and to Commonwealth countries other than Britain expanded strongly, but those to the rest of the world decreased by 19%. A sharp drop in sales of wheat to eastern Europe, particularly to the USSR, accounted for much of the decline. The Canadian government, however, announced in August a large new contract for the sale of wheat to the Soviet Union, and another, to Communist China, in October. Delivery of some of this wheat before the winter freeze-up was expected to cause exports to expand in the latter part of the year. Unlike wheat, total shipments of which were far below 1964 levels through August 1965, sales of newsprint, woodpulp, iron ore, and aluminum rose significantly, especially in response to strong demand from the United States.

As the Canadian economy continued its fifth consecutive year of expansion, this growth was reflected in a large increase in demand for imported products, both for industry and consumer use. The extensive rise in private and public investment stimulated foreign purchases of steel mill products and nonferrous metals, while increasing consumer incomes were the cause of greater imports of motor vehicle parts for assembly as well as of assembled passenger cars. Purchases of aircraft were also much higher than in 1964.

Imports through May from the United States went up 10%, following a 16% rise in 1964 over the previous year. Larger purchases were also made in Japan and in several European countries. In the first five months, the only major trading partners supplying less to the Canadian market were Venezuela and Britain; from both countries the decreases were minor.

A new development, likely to have a significant effect on Canadian-U.S. trade in the years to come, was the establishment of duty-free trade in automotive products between the two countries. A joint agreement, signed on Jan. 16, 1965, was implemented in Canada at once by an order in council and in the United States by the Automotive Products Trade Act of 1965, signed into law by President Johnson on October 21. The agreement represented

a step toward a unified North American automotive industry, and was expected to lead to expanded trade in both directions across the border.

Almost entirely as a result of unfavorable trade movements, Canada's balance of international payments on current account showed an enlarged deficit in the first half of 1965. From \$491 million in January-June 1964, the current account deficit rose to \$757 million in January-June 1965. An increase of only 2% occurred in the net payments for nonmerchandise trade items. There were nearly offsetting effects from changes in individual items, with larger net payments for travel, official contributions, and interest contributing to the increased outflow.

Net capital inflows through June showed a rise of about \$160 million, largely because of an increase in long-term forms.

Latin America. Although Latin American trade was in a depressed condition at the beginning of the year, it picked up in the second quarter and promised to rise above 1964 levels for the full year. The rate of expansion, however, was expected to be lower than the 8% increase in the previous year, which had brought both exports and imports to peak levels.

As aid and foreign investments in this area continued to expand, it became increasingly necessary for many of the Latin American countries to increase exports in order to meet their payments for debt servicing and investment income. The expansion of exports was difficult to achieve because the countries remained dependent on a few products for which world demand and prices were not growing strongly. In the first half of the 1960's, for example, exports from Latin America increased by an average 5.2% per year, compared with a gain of 6.2% for all other developing countries and an annual world export expansion of 8.5%.

Imports into Latin America are largely essential machinery and equipment for development, and cannot be reduced without affecting growth rates. For a while, various countries attempted to develop "import-substitution" industries in order to reduce the costs of imports. Frequently, however, these new domestic industries provided much costlier goods than those imported, and efforts in this direction have now been deemphasized. Because of the limited growth of imports by Venezuela and Brazil, the value of goods ar-

riving in Latin America from abroad expanded an average of 3.3% a year in the period 1959-65. This rate was even slower than the rate for exports.

Regional economic integration continued to proceed slowly in Latin America. The decision of Venezuela late in October to join the Latin American Free Trade Association was considered a hopeful sign for the expansion of that organization. Venezuela's economy is among the strongest in the region. The country has extensive reserves and consistently large surpluses in trade and balance of payments.

After continuing to run a large trade deficit in 1964, Mexico showed every prospect of doing so again in 1965. Capital goods, which make up the bulk of Mexico's imports, expanded further in 1965 to support economic development in that country. Foreign exchange reserves dropped by mid-1965 to their lowest point since Sept. 30, 1963.

Brazil, which experienced an export surplus in 1964 for the first time in 10 years, attained a further improvement in its trade balance in the first half of 1965. An adjustment to a more realistic rate of foreign exchange and a good agricultural harvest were expected to lead to additional increases in export earnings, while imports were aided by new foreign aid and loans.

Europe. Exports from the 18 European countries of the Organization for Economic Cooperation and Development (OECD) continued their strong uptrend of recent years, rising in the first half of 1965 by 11%. The import expansion, which had averaged more than 10% in each of the two previous years, slowed somewhat. Through June, arrivals of foreign goods into OECD countries (including imports from each other) were about 7% higher than in January-June 1964.

All major areas of the world purchased more from the OECD countries in 1965. The largest value increase over 1964 related to their trade with each other, which accounts for more than 60% of the total. Demand was relatively stronger, though, from the Sino-Soviet bloc, Oceania, and North America.

Imports into the OECD countries were significantly larger from Africa and North America, as well as from each other. West Germany provided the fastest growing market for imports in 1965. In fact, in the third quarter, purchases from other

Special category.....	2,042,000,000	822,000,000		

¹ Country data exclude "special category" exports on which information is withheld for security reasons. Export data by country for 1965 are not comparable with those for 1964. A major declassification of over \$1 billion of "special category" exports was initiated, beginning January 1965, on products for which country of destination information was formerly withheld.

countries were so large that West Germany ran a trade deficit, on a gross basis, for the first time in many years. The balance of payments on current account for the first nine months registered a deficit of almost 5.6 billion Deutsche marks (DM), compared with a surplus of DM0.9 billion in the comparable period of 1964. The deficit was caused by deteriorations in both the service and trade accounts. The service account showed larger deficits from investment income payments and tourism, and the trade account deteriorated because imports accelerated faster than exports.

Britain, whose imports ranked second to West Germany's among the European countries for the first time in 1965, recorded only a slight rise in foreign purchases in the first nine months of the year, compared with the monthly rate for 1964. Although the 15% surcharge levied on all imports except food and raw materials in October 1964 was reduced to 10% toward the end of April 1965, imports were still held in check. Exports, on the other hand, expanded by 5.5% in January–September over the 1964 monthly average. The United States proved an exceptionally expansive market for British goods in 1965, and sales to the sterling area and the European Free Trade Association countries were also strong.

The British balance of payments in the second quarter of 1965 showed a surplus for the first time since the second quarter of 1963. For January–June 1965, payments remained in substantial deficit, although there was a marked improvement over July–December 1964. The combined current and long-term capital account deficit, after seasonal adjustment, dropped from £760 million in July–December 1964 to £330 million in January–June 1965, at annual rates.

U.S. Department of Commerce*

TARIFFS

The major world developments in the field of tariffs during 1965 were the adoption by various countries of either new tariff classifications and/or new rates of duty, actions by the contracting parties to the General Agreement on Tariffs and Trade (GATT), and continued progress by regional economic groups.

New Tariff Schedules. At the close of 1965, the tariff classifications of about 80 countries, including those of most members of the major regional economic groups, were based on the Brussels Tariff Nomenclature (BTN). Mexico, Australia, Nigeria, Cambodia, and South Africa recently had adopted such classifications; approximately 15 other countries were contemplating doing so. The United States was one of the few remaining major trading nations whose tariff schedule was not constructed on the basis of the BTN.

Primarily in an effort to alleviate balance-of-payments difficulties, several countries imposed import duty surcharges. In October 1964, Britain had levied a surcharge of 15% on most imports except food and basic raw materials; in April 1965 the surcharge was reduced to 10%. India, Paraguay, and Jordan also increased their rates of duty during the year. Other countries, notably Pakistan, Israel, Iceland, and Turkey, liberalized their import restrictions.

U.S. Rates. The most important U.S. tariff changes in 1965 occurred under an agreement between the United States and Canada. Signed on January 16,

it removed the duties on shipments between the two countries of automobiles and automobile parts for assembly. The agreement and accompanying arrangements were expected to stimulate increased manufacturing in Canada, and eventually to provide substantial savings to consumers in that country, where the duties on automotive products were relatively high.

GATT. By the end of 1965, 66 countries were members and 6 were provisional members of the General Agreement on Tariffs and Trade—a multilateral agreement governing rules of conduct in international trade and establishing schedules of tariff concessions by the respective contracting parties. The problems of the developing countries continued to hold high priority at the 22nd plenary session of GATT contracting parties held in Geneva, Switzerland, March 2–25, 1965.

In October, the contracting parties undertook a major review of the Long-Term Arrangement Regarding International Trade in Cotton Textiles. The arrangement, which had been negotiated under the auspices of GATT and had been operating for three years, is designed to prevent market disruption and to promote the orderly development of international trade in cotton textiles, particularly as it affects developing countries. Under the arrangement, which is to remain in force until October 1967, the United States by October 1965 had concluded agreements with 19 countries governing their exports of cotton textiles to the United States.

It was hoped that the sixth round of GATT negotiations—the so-called Kennedy round, which opened in Geneva on May 4, 1964, and continued throughout 1965—would achieve results more comprehensive than those attained in any of the five earlier rounds. Whereas past negotiations had dealt with tariff barriers almost exclusively on an item-by-item basis, the Kennedy round aimed at substantial linear (across-the-board) reductions. By the close of 1965, however, few of the issues that were at stake had been resolved.

As a step toward negotiations in the industrial field, the principal participating countries had submitted in November 1964 “exceptions” lists identifying the industrial items which were to be wholly or partly excepted from the linear tariff reduction. During the first part of 1965, the participants agreed to submit offers on all agricultural products by September 16, but members of the European Economic Community were prevented from doing so by France's delay in participating.

Regional Arrangements. In recent years many countries have formed regional economic arrangements while continuing to adhere to their commitments in the GATT. Some of these arrangements have objectives that are much broader than the achievement of a common tariff policy. They all aim to eliminate or reduce trade restrictions between member countries, and some of them seek to establish a common external tariff.

European Economic Community (EEC). On Jan. 1, 1965, the member states of the EEC—Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany—reduced by another 10% the duties applicable to commodities originating within the community. As a result, duties on industrial imports originating within the community became generally dutiable at rates equal to only 30% of those existing on Jan. 1, 1957. Duties on most agricultural products traded within the community were reduced to either 45% or 50% of those existing on the same date. The 1965 re-

duction, like most of the earlier reductions, was ahead of schedule; hence, it was hoped that tariffs on intracommunity trade in manufactured goods would be eliminated at least by 1967. On July 1, 1965, however, further progress was interrupted when France announced that it would not participate in the community's forthcoming activities.

During 1965, the member states of the EEC made no further alignment of their national tariffs with the EEC's projected common external tariff. Two of three stages toward such alignment had been completed previously, reducing the difference between the 1957 rates of the individual members and the rates of the common external tariff by 60%, with certain exceptions.

European Free Trade Association (EFTA). The EFTA, like the EEC, hoped to achieve duty-free trade in industrial goods among themselves by Jan. 1, 1967. Therefore, the association members—Austria, Britain, Denmark, Norway, Portugal, Sweden, and Switzerland—reduced the rates of duty on intra-EFTA trade in industrial commodities by another 10% on Dec. 31, 1964. The resulting rates were generally equal to 30% of those existing in 1960, when the EFTA was formed. An additional 10% reduction was effected on Dec. 31, 1965. Finland, which had become an associate member in 1961, enjoys the rights of a full member of the association, although it is still behind the others in scheduled tariff reductions.

Unlike EEC members, EFTA members have not been required to reduce duties on agricultural commodities traded among them (although efforts have been made to stimulate intraregional trade in these products.) Nor have they undertaken to create a common tariff on imports from countries outside the association. (See EUROPE.)

Latin American Free Trade Association (LAFTA). At their fourth annual session in late 1964, the members of the LAFTA—Argentina, Brazil, Chile, Colombia, Ecuador, Mexico, Paraguay, Peru, and Uruguay—agreed to various concessions, effective Jan. 1, 1965. These concessions brought the number granted since LAFTA's inception in 1961 to approximately 8,600. The members approved the first "common schedule," identifying articles for which all trade barriers between members were to be eliminated by 1973. Once an item had been placed on the common schedule, member countries could not, without authorization, withdraw or alter the concession thus accorded. The fifth annual round of LAFTA negotiations was in progress late in 1965.

Members of the LAFTA, like those of the EFTA, continued to apply their individual tariffs to imports from nonmember countries; the fourth LAFTA session, however, did adopt a resolution calling for the ultimate establishment of a common external tariff.

Central American Free Trade Area (CAFTA). By 1965 the CAFTA—composed of Costa Rica, El Salvador, Guatemala, Honduras, and Nicaragua—had essentially realized its aim of duty-free trade among members. Progress also was made during the year toward the creation of a common tariff applicable to commodities imported from nonmember countries. This common external tariff was expected to be completed around 1970. (See LATIN AMERICA.)

Secretary, U.S. Tariff Commission

IOWA

The 1965 session of the Iowa General Assembly was the most controversial in a decade. Democrats controlled both houses for the first time in 30 years, and 100 of the 183 members of the Assembly were sitting in the legislature for the first time. In addition to having the youngest membership, the 61st General Assembly session was the most expensive and the longest regular session in the history of the state.

Legislation. The Assembly, which convened on January 11 and adjourned on June 4, adopted a budget of \$267 million, nearly \$12.4 million higher than that recommended by Democratic Gov. Harold Hughes. A total of 480 bills were passed and only three were vetoed by the governor. One constitutional amendment was approved for the second time, as required by the state's amendment procedure. The amendment, to be voted on by the people in the November 1966 elections, allows laws to go into effect on July 1 of the year in which they are passed, rather than on July 4.

Eight constitutional amendments were approved for the first time by the 1965 session. The amendments would accomplish the following: (1) give the legislature authority to fix expense allowances as well as salaries for members of succeeding legislatures; (2) provide for annual sessions of the legislature; (3) legalize bingo; (4) give the governor

IOWA · Information Highlights

Area: 56,290 square miles.
Population: 2,783,000 (1965 est.).
Chief Cities (1965 est.): Des Moines, the capital (216,000); Cedar Rapids (103,000); Davenport (94,500); Sioux City (91,000); Waterloo (74,000); Dubuque (59,500); Council Bluffs (58,500); Iowa City (38,500).
Government: Chief Officers—governor, Harold E. Hughes (Democrat); lt. gov., Robert D. Fulton (D); secy. of state, Gary L. Cameron (D); atty. gen., Lawrence F. Scalsie (D); treas., Paul Franzburg (D); supt. of pub. instr., Paul F. Johnston; chief justice, Theodore G. Garfield. **Legislature**—Iowa General Assembly (convened Jan. 11, 1965); Senate, 59 members (34 Democrats, 25 Republicans); House of Representatives, 124 members (101 D, 23 R).
Education: School enrollment (1964-65)—public elementary, 464,000 pupils (14,904 teachers); public secondary, 168,000 pupils (12,629 teachers); nonpublic schools, 111,100 pupils (3,710 teachers); college and university (fall 1964), 75,398 students. **Public school expenditures** (1964-65)—\$266,600,000 (\$465 per pupil); average teacher's salary, \$5,747.
Public Finance (fiscal year, 1964): Revenues, \$613,005,000 (sales tax, \$88,215,000; motor fuel tax, \$63,092,000; federal funds, \$129,511,000). Expenditures, \$586,264,000 (education, \$159,599,000; health, welfare, and safety, \$70,252,000; highways, \$181,150,000). **State debt**, \$25,650,000 (1964).
Personal Income (1964): \$6,548,000,000; average annual income per person, \$2,376.
Public Assistance (fiscal year 1965): \$55,350,628 to 75,322 recipients (aged, \$30,196,200; dependent children, \$19,531,000).
Labor Force (employed persons, July 1965): Agricultural, 294,500; nonagricultural (wage and salary earners), 747,800 (25% manufacturing, 24% trade, 18% government). Unemployed persons (July 1965)—20,000.
Manufacturing (1963): Value added by manufacture, \$2,275,928,000 (transportation equipment, \$25,727,000; primary metals, \$106,092,000; nonelectrical machinery, \$476,344,000; electrical machinery, \$256,121,000; fabricated metals, \$103,121,000; food and products, \$653,063,000).
Agriculture (1964): Cash farm income, \$2,912,036,000 (live-stock, \$1,994,617,000; crops, \$691,141,000; govt. payments, \$226,278,000). Chief crops (tons)—corn for grain, 21,137,000 (ranks 1st among the states); hay, 8,124,000 (rank, 2nd); oats, 1,882,000 (rank, 2nd); grapes, 450,000 (rank, 14th); wheat, 78,000; sorghum grain, 41,000; barley, 6,600.
Mining (1964): Production value, \$106,630,000 (rank, 29th). Chief minerals (tons)—gypsum, 1,287,000 (rank, 3rd); stone, 23,935,000; sand and gravel, 13,890,000; clays, 1,008,000; bituminous coal, 973,000.
Fisheries (1963): Commercial catch, 2,438,000 pounds (\$173,000).
Transportation: Roads (1965), 112,104 miles (102,451 surfaced); motor vehicles (1965), 1,573,839; railroads (1964), 8,637 miles; airlines (1965), 4 (224 airports).
Communications (1965): Telephones, 1,283,000; television stations, 13; radio stations, 87; newspapers, 48 (daily circulation, 960,922).

power to veto separate items on appropriations measures; (5) give the governor authority to appoint the secretary of state, state treasurer, and attorney general, and give the legislature authority to appoint the state auditor; (6) provide home rule for municipalities; (7) extend the term of the governor and lieutenant governor from two to four years; and (8) provide a new legislative apportionment plan calling for a Senate of not more than 50 members, and a House of not more than 100—both apportioned on a strict population basis.

The temporary legislative apportionment plan adopted in 1964 was challenged in the courts in 1965. Senate apportionment was declared unconstitutional by a three-man panel of federal judges in February. Apportionment of both houses was under review by the Iowa Supreme Court at the end of the year.

Important laws enacted during the year changed the time of the primary elections from June to September, abolished capital punishment, and permitted counties to create an office of public defender. The Assembly also increased the salaries of almost all elected officials. Salaries of legislators were raised from \$30 to \$40 per day, and the governor's salary was increased to \$25,000 per year.

Floods. During April the Mississippi and its tributaries reached record high-water levels, forcing thousands from their homes along the eastern border of the state. The flood crested at Dubuque on April 26, and in Davenport the following week.

Keokuk Tragedy. An explosion in the Keokuk National Guard Armory on November 24 caused 20 deaths and injured 30 persons. A natural gas leak was blamed for the explosion and fire which occurred during a square dance in the armory.

Agriculture. In 1965, Iowa lost its place for the first time in eight years as the leading corn-producing state. The corn crop for the year was second in size to that of Illinois.

IRAN

The existence of underlying political unrest in Iran was revealed during 1965 by the assassination in January of Premier Hassan Ali Mansur and by an unsuccessful attempt in April against the life of Shah Mohammed Reza Pahlavi. The government of the shah remained firmly in control, however, and the new premier, Amir Abbas Hoveida, pushed ahead with the so-called revolution from the throne, a program aimed at economic development, political reform, and social modernization.

The country, emerging from a depression which had gripped the business community between 1961 and 1964, appeared increasingly prosperous, though agricultural development and private investment in

industry lagged. Fears were expressed over the disruptive effects of inflation and sharply rising imports.

Assassination of Mansur. Premier Mansur, who had held office since March 7, 1964, was shot while on his way to address a session of the Majlis (National Assembly) on Jan. 21, 1965, and died five days later. The assassin and three accomplices were identified as adherents of Fedayan Islam, a reactionary religious group opposed to modernism and secularism. All four were condemned to death by a military tribunal in Teheran on May 9 and executed by a firing squad on June 16.

On January 27 the shah appointed as premier Amir Abbas Hoveida, the finance minister in Mansur's cabinet and a man closely connected with the reform program. Hoveida retained Mansur's cabinet virtually unchanged and pledged his government to carry out the full program of his predecessor. He received an overwhelming vote of confidence in the Majlis on January 31.

Attack on the Shah. On April 10 a young conscript in the shah's guard, Reza Shamsabadi, fired at the ruler outside his office in the Marble Palace. The shah escaped uninjured, and the attempted assassin was killed on the spot. The government later announced that the attack on the shah had been part of a plot to launch a nationwide campaign of terror, and that it had been attempted by a Communist-oriented group of Iranian graduates of foreign universities who had participated in the anti-monarchical student movement abroad. Six persons were arrested for complicity in the plot.

Economic Planning. Efforts were made during 1965 to speed up the lagging Third Economic Development Plan (1962-68), under which the gross na-

IRAN · Information Highlights

Area: 636,363 square miles.
Population: 22,860,000 (July 1, 1964 est.).
Chief Cities (1963 est.): Teheran, the capital, 2,317,116; Tabriz, 387,803; Isfahan, 339,909; Meshed, 312,186.
Government: King—Shah Mohammed Reza Pahlavi (b. 1919; acceded 1941); Premier—Amir Abbas Hoveida (took office Jan. 27, 1965). Parliament—Majlis (National Assembly), 200 members; Senate, 60 members.
Religious Faiths: Muslims, 98% of population.
Education: Literacy rate (1956)—13% of population aged 15 and over. Total school enrollment (1962-63)—2,099,163 (primary, 1,719,426; secondary, 325,454; teacher-training, 5,726; technical and vocational, 9,197; higher, 39,360).
Finance (1965 est.): Revenues, \$909,000,000; expenditures, \$1,019,000,000; public debt, (1964) \$840,000,000; monetary unit, rial (75.75 rials equal U.S.\$1).
Gross National Product (1963): \$4,879,000,000.
National Income (1963): \$4,317,000,000; average annual income per person, \$195.
Economic Indexes: Agricultural production (1964), 137 (1956-57=100); cost of living (1964), 132 (1958=100).
Manufacturing (metric tons): Gasoline (1963), 2,624,000; wheat flour (1962), 1,585,000; cement (1964), 745,000; beet sugar (1964), 177,000.
Crops (metric tons, 1964-65 crop year): Wheat, 2,750,000 (ranks 17th among world producers); rice, 860,000 (rank, 18th); tea, 12,900 (rank, 9th); barley, 893,000; cottonseed, 216,000; dates, 285,800; oranges, 45,000.
Minerals (metric tons, 1964): Crude petroleum, 618,731,000 barrels (ranks 6th among world producers); natural gas (1963), 108,511,000,000 cubic feet (rank, 11th); gypsum, 1,179,000 (rank, 9th); salt (1963), 345,000; bituminous coal, 200,000; chromite (1963), 100,000 (rank, 7th).
Foreign Trade (1964): Exports, \$1,254,000,000 (chief export, petroleum, \$1,110,000,000); imports, \$673,000,000 (chief imports, 1962: iron and steel, \$78,745,000; pharmaceuticals, \$26,513,000; chemicals, \$24,174,000). Chief trading partners (1962): Britain (took 16% of exports, supplied 19% of imports); West Germany (took 11% of exports, supplied 18% of imports); U.S. (took 4% of exports, supplied 19% of imports).
Transportation: Roads, (1964), 20,063 miles (3,528 paved); motor vehicles (1964), 177,000 (automobiles, 127,000); railways (1963), 2,174 miles; merchant vessels (1964), 4 (28,000 gross registered tons); national airline, Iran National Airlines; principal airport—Teheran.
Communications: Telephones (1964): 160,000; television stations (1964), 3; television sets (1964), 100,000; radios (1963), 1,600,000; newspapers (1961), 27.

tional product had increased only 3%, instead of the projected 6%, in 1964. In presenting the 1965-66 budget to the Majlis in March, Premier Hoveida said that the government intended to step up the tempo of investment and create more jobs, while stabilizing prices and improving the foreign exchange balance. The development budget provided for expenditures of 55.4 billion rials.

The major source of funds for the development program was the government's revenue from petroleum exploitation. Foreign loans and grants, however, significantly augmented this income. On April 28, for example, the World Bank approved loans totaling \$40.5 million to extend the main highway network northeast to the Afghan border and southeast to the new port at Bandar Abbas, and to construct feeder roads. At the same time, the Export-Import Bank of Washington announced a \$20 million loan for the purchase and installation of two 82.5 megawatt electrical generating units at Teheran.

Land Reform. The final phase of the government's land reform program, the breaking up of medium-size estates, moved forward slowly. On April 24, representatives of 14,000 farmers received from the shah titles to lands in expropriated villages. However, uncertainties in the scheduling of the program, lack of knowledge and finances by farmers, and the insufficient number and inexperience of the recently established cooperatives limited agricultural production. The shah therefore fostered the creation of an Agricultural Extension and Development Corps—modeled on the already functioning Literacy Corps and Health Corps—to employ young men eligible for the draft but not needed in military service, in helping farmers to develop their land and encouraging them to join cooperatives.

Petroleum Developments. Oil production by the international consortium that operates the Iranian oil industry on behalf of the government-owned National Iranian Oil Company (NIOC) showed moderate growth over 1964. However, competition from North Africa and other oil-producing areas tended to limit Iran's oil exports. A new agreement with the consortium, ratified by the Majlis in January, increased the government's oil revenues by some \$30 million annually. On February 7 the Majlis approved agreements between NIOC and five groups of international oil companies for the exploration and exploitation of offshore areas in the Persian Gulf. Iran received an initial payment of \$185 million for the exploration rights and entered into arrangements by which 75% of the profits from exploited petroleum would accrue to NIOC and the government.

Foreign Affairs. Iran continued its alliance with the West through its membership in the Central Treaty Organization (CENTO), in which Britain, Turkey, and Pakistan are members and the United States is an active participant. The CENTO Ministerial Council held its 13th meeting in Teheran, April 7-9. Early in June, the 3,060-mile CENTO microwave telephone line between Ankara (Turkey), Teheran, and Karachi (Pakistan) went into full operation. Iran also participated with Turkey and Pakistan in the work of the Regional Cooperation for Development Group, established in July 1964, which sought to foster closer economic, technical, and cultural cooperation among the three states, outside the CENTO alliance.

The Indian-Pakistani clash over Kashmir in the summer and autumn of 1965 created a difficult problem for Iran, whose ties of religion and alliance to Pakistan were close but whose relations with India

were also cordial. Early in September, Pakistan invoked the CENTO pact and requested support from her partners. In response, Iran joined Turkey in pledging material aid. On September 14, Premier Hoveida flew to Rawalpindi, to discuss assistance to Pakistan, but also to urge peaceful settlement of the dispute. The cease-fire arranged by the United Nations on September 23 was welcomed in Teheran.

IRAQ

President Abdul Salam Arif of Iraq, who had seized control of the government in 1963, continued to maintain himself in power during 1965 by playing Baathist and Nasserite political forces against one another. However, he appeared to be in an increasingly isolated position and was dependent on the backing of the army. In September an attempted coup against Arif was crushed by loyal troops.

Little progress was made toward the restoration of constitutional government, which had been promised in the provisional constitution promulgated in May 1964. The project for a political union of Iraq and the United Arab Republic, developed by Presidents Arif and Nasser in 1964, moved forward only at a snail's pace. Kurdish unrest still festered in the north. The initiation of an ambitious five-year development plan provided some impetus to the country's economic activity, but political uncertainty still hampered the partially nationalized Iraqi economy.

Political Developments. Shifts in the cabinet of Premier Taher Yahya on Nov. 14, 1964, had strengthened the Nasserite element within the government. Early in July 1965, however, six Nasserite cabinet members resigned, charging that President Arif and Premier Yahya had been dilatory in implementing Arab socialism and in forwarding union with the United Arab Republic. On September 2, Premier Yahya resigned, and four days later President Arif appointed as premier Brigadier Arif Abdul Razzak, commander of the Iraq air force and a
